6. The small reduction in peripheral speed, in the case of motor converters, is obtained at the expense of the size and price of machine. At the present day, when commutator and brush design has reached such a degree of perfection, small differences in peripheral speed are of no consequence. As regards noise, it is possible with the peripheral speeds adopted at the present day for rotary converters, to build machines practically noiseless in operation. It may be said, in this connection, that a machine, although it may have a peripheral speed of only 25 metres per sec., may be more noisy than another machine with 35 metres per sec., if not properly designed.
7. The operation of a rotary converter is as simple as of a motor converter, while the fact that the high-pre winding is in the transformer is an important adva of the rotary converter.

   The rotary converter is, on the other hand, simpler than the motor converter as regards design the case of the latter plant, for instance, the leads necting the two rotor windings have to be led thr the hollow shaft and middle bearing, this being a weak point from a constructional point of view.

   It may be added that a better utilisation of the available is possible with rotary converter equipm as the position of the transformer can be chosen inde dently of that of the rotary converter. This is a siderable advantage seeing that converting plant is us installed in large centres where floor space is very c

   As regards the plea that motor converters are reliable owing to their lower speed, this can hardl taken seriously, as experience has shown that 50-c rotary converters could be built for a speed of 1,500 r.p with every guarantee of reliability in service, for press as high as 1,500 volts.

The mere fact that so few makers of electrical machi have taken up the construction of motor converters is, in writer's opinion, a clear indication that the advantage rotary converters over motor converters are generally re nised; it is, however, quite comprehensible that those have been unable to produce 50-cycle rotary converters c ating satisfactorily from a commutation point of view, sh encourage the present fad for motor converters, but the chaser cannot fail to appreciate that, in view of the lim number of manufacturers of motor converters, the cost of type of plant, already so disproportionally high as comp with that of rotary converters, will tend to ascend still furt

G. Wüthrich, M.I.E.E

London, *October 24th*, 1925.

Firemen's Risks.

Your leader on the above subject draws attention to important point in connection with wiring, not only from point of view of fatal shocks, but also that of electrica caused fires.

There is no doubt in my mind that slip conduit wir especially as found in City premises, is a frequent cause fires. When installed in private suburban houses it form reasonably safe installation, because there is generally r to isolate it from other metal work. But in City premises all wiring contractors know, it is invariably jumbled up w a mass of lead-covered telephone lines, gas and water pi screwed electrical conduit, &c., all forming, more or less, g earths. Of course, as you remark, "everything depends u the honesty and skill of the workman," and a badly-erec "screwed" or "grip fitting" installation is as muc source of danger as any other, but the point is that e the best workman cannot make an electrically sound job o "slip-conduit" system.

It seems to me that the various electrical supply authori possess the power to raise the standard of wiring. Any co pany which adopts the I.E.E. rules, and an increasing num are adopting them, must refuse to connect any "slip" c duit wiring, and this in course of time will tend to eli nate it.

Your point about cutting off the supply, as the fire briga do with gas, was mentioned to a fire officer during the case question, who pointed out that in large buildings they often glad of the light to see their way about. If it is deci that it is safer to cut off the supply, then the main swi should be *outside* the building.

A. Roberts,
City Electrical Engineer

Guildhall, London, *October 20th*, 1925.

Broadcasting Power.

I would not trouble to reply to Mr. Amphlett's somewh bombastic letter did I not realise, he has already addressed r personally, that he is at least enthusiastic. It is his rema concerning the bankruptcy of science that intrigues me.

Science is not bankrupt; it is those persons who refuse use their imagination and who devote their lives to events historical interest who are responsible for the fact that am teurs succeed where professionals fail.

Your correspondent refers to the fact that of the energy p into broadcasting, not one thousand-millionth part is useful employed. Quite so. Does he seriously imagine that in a fe centuries' time—not a long period other than relative to o short lives—the only changes that will take place in wirele will be in the colour of the knobs employed on receiving set Does he think that the scientist of the future will be conte with such wastage?

Does Mr. Amphlett realise that thirty years ago to send message one mile by radio was an achievement, and that that period Sir William Preece wrote of Marconi's experimen that "Radio would never be of commercial value"?

It is only about three centuries ago that a judge and jury i England killed old ladies, on the evidence of children that the were witches and that they employed familiar imps to do the bidding. Our knowledge of radio to-day is on a par with th period. Is it not honest to admit it? I tremble to think wh

Amphlett's grandfather would have said if he had been
that in 1925 one would be able to fly across the Atlantic
speak to one's house *en route*! ! !
e experiment referred to by Mr. Amphlett is not the only
Tesla's experiments are interesting, as are those of many
rs who realise that we who live to-day will be cave men

t out that in the early days of photo transmission by radio
of radio television, many of the greatest experts said that
lts were impossible and the suggestion was attributable to
dman's dream.
merely expressed a courteous opinion of what might happen
erhaps a thousand years' time. Your correspondent, less
ely, refers to Senator Marconi's sarcasm. It might interest
to know that Marconi *does* believe in the possibilities I
d. We should surely remember that if many learned
le are of opinion that even spirits can be seen, he should
in, in my humble opinion, from denying every possibility
he himself cannot visualise.
e possibility of to-day is the probability of to-morrow.
thing is so difficult to define as the impossible.

A. M. Low, A.C.G.I., &c.

ndon, *October 18th*, 1925.

The Æsthetic Aspect of Advertising.

e letter of "Advertiser," of Liverpool, in reply to my
hetic Parable raises such an interesting point that I feel
asking the Editors to grant me half-a-dozen pages in
h to reply. However, as such a course would probably
e a howl of protest from the electrical industry in general,
ill encroach upon the pages of the REVIEW as little as
ible, and endeavour to be concise.
iefly, then, my letter was correctly described by its title.
ealt with the æsthetic aspect of advertising. "Adver-
's" letter raises quite a different question; I do not think
all be unfair to him if I word it thus: Is not even artis-
ly bad advertising better than none at all?
this I reply, certainly it is; and I invite "Advertiser"
onsider with me, starting from this basis of common
ement, whether æsthetically good advertising is not better
æsthetically bad advertising. My letter was an expres-
of my views on this point, which, speaking generally,
that artistically bad advertisements either cancel out or
oke only disgust. It is not sufficient to attract attention:
ust is a form of attention. But I have never heard any-
advocate the selling value of disgust!
am sorry if my purely artistic criticism has been taken
eflecting in any way on the work of those who laboured
uild up "Advertiser's" statue of Truth, and to deserve
noble words which he gives as their epitaph. Their
lem was to create a good name by giving honest value,
this object and the sacrifices they made to gain it, were
noble. I join with "Advertiser" in revering their
nory. But may I point out that the problem of the
ern advertiser is quite different? Advertising is now
blished. It has grown, and is now risen to the dignity
employing artistic means to accomplish its ends. That
is so is recognised at least by those who set the com-
tion which is running in the pages of the REVIEW. The
points upon which entries will be judged are all artistic;
they are secured by employing artistic means. And
o far as any advertisement claims to use artistic means,
open to artistic criticism.
ay I put before your correspondent a consideration rather
e general than even the above? The use of trade marks,
ness names, advertising, &c., was a great reform. It
ed its purpose of preventing, to a great extent, fraudulent
ufacture. But, as businesses have enlarged, and have
red more into the life of the Empire, so advertising has
rged. It is a growing thing, and it is the nature of
wing things to require direction and pruning. They must
hecked here and encouraged there. They are at all times
le to irregular growth, abuse, and deterioration. And it
often happens that those who have grown up with any
icular reform from the outset, are unable, because of the
nny which preconceived ideas exercise over all of us, to
eive where the reform is tending, and what are its defects
growth. It is here that outside criticism can be most
uable. The very fact that advertising is capable of pro-
cing æsthetic criticism is evidence of a state of healthy
wth.
s my artistic criticisms have not been questioned by
dvertiser," it is not necessary for me to defend them.
ideal REVIEW, from the standpoint of good advertising,
uld be one containing such attractive advertisements that
lers would be unable to tear themselves away so much as
ook at the letterpress. May the efforts called forth by the
IEW competition hasten such a happy result!

B. Twigg.

reat Malvern, *October 18th*, 1925.

The Manufacture of Alternating-Current Motors.

s I am interested in the publicity methods criticised in
last paragraph of Mr. F. Parkinson's letter in your issue
he 23rd inst., may I assure Mr. Parkinson that the adop-
of a distinguishing name is quite dignified, legitimate,
sound publicity. Notwithstanding Mr. Parkinson's dis-approval, the treatment is being shared by very good company in engineering advertisements.

That engineering products *do* lend themselves to the adoption of a trade name is corroborated by the success of the policy in this case, a success which is emphasised in the thinly-veiled chagrin apparent in Mr. Parkinson's remarks. That he should publicly disparage his competitor's publicity policy is a good indication that the policy is effective.

D. Ross Kennedy.

Denton, Manchester, *October 24th*, 1925.

Legal.

American-German "Bosch" Litigation.

IN the Chancery Division on October 22nd, Mr. Justice Astbury commenced the trial of a case which was in the nature of an appeal from a decision of the Registrar of Trade Marks, allowing the word "Bosch" to be registered in respect of magnetos and sparking plugs. The applicants for registration were a German company, the Robert Bosch, A.G., and the application was opposed by the American Bosch Magneto Corporation.

Sir Arthur Colefax, K.C., and Mr. Moritz, K.C., appeared for the American company, the appellants and opponents, and Sir Duncan Kerly, K.C., Mr. Sebastian and Mr. Bray, for the respondents and applicants.

SIR A. COLEFAX said that the German company applied for the registration of two marks—the word "Bosch" in both cases—in respect of (1) magnetos, charging dynamos, and electrical self-starters, all for use with internal combustion engines; and (2) sparking plugs. Each application was dated September 11th, 1922. The application was made under Section 9, Sub-section 5, of the 1905 Act as amended by the 1919 Act, which provided that a mark should not be registrable except on evidence of distinctiveness, and "distinctive" meant "adapted to distinguish the goods of the applicants from those of other persons." The name "Bosch" was a surname which was not readily registered so far as our courts were concerned. The applicants carried on business at Stuttgart and they said that the word "Bosch" was their most important trade mark and had been used in Great Britain continuously since 1906. The applicants also said that the word had been regarded since 1906 by their customers as their trade mark designating their goods, and it was recognised as exclusively applied to their goods. They further said they had spent thousands of pounds in making the goods known; that their opponents never used the word "Bosch" as their trade mark, and were only a concern with a place of business here having "Bosch" as part of their name; and that the use by any other person would tend to confusion. The opponents, on the other hand, said that the word was not and could not be distinctive of the products of the applicants and was calculated to deceive for the reason that the word "Bosch," which formed part of the corporate title of the opponents, had been used by them for many years past in the United Kingdom. The opponents, continued Counsel, were incorporated in the United States in 1919 and they acquired the stock, patents, patent applications, and goodwill of an American company—the Bosch Magneto Co. (Inc.), which was formed in 1906 and had acquired certain rights from Robert Bosch. It appeared from an affidavit filed on behalf of the applicants that Robert Bosch started business in 1886 and in 1896 the individual business became a firm's business and the applicants themselves were incorporated in 1917 in Germany. Opponents' case was that the word "Bosch," whatever its meaning was in this country at the outbreak of war, ceased in the war to distinguish or to be capable of distinguishing the German-made goods: the word was applied here, equally to any surviving German goods, any American goods, and any English goods, more especially magnetos. Since the war ended "Bosch" had been applied as largely to American-made products as to German-made products here. Further, there was an enormous business in the United States in American-made products with which the applicants had nothing whatever to do. From 1914 to 1920 the German-made goods were not coming to this country, but since 1920 the applicants' conduct showed that the word did not distinguish their goods in their conduct amounted to an abandonment of any right—if they had any—in the word "Bosch." "Bosch" to-day meant a type of magneto, and that type was made in Germany and elsewhere, notably in the United States. Another consideration for the Court was this, that if this registration were to be allowed, they would have this position: there were and had been for a very considerable number of years thousands of American cars coming into this country which had got as part of their standard equipment, some product of the American company marked "Bosch" with a perfectly clear indication of American origin. The Bosch Magneto Company (Inc.), the predecessor of the opponents, was in existence when the war broke out in America and went on until May, 1918, when the Custodian of Enemy Property in the United States took possession of the property of that company, which was a German company in America, and was substantially owned by Robert Bosch. The company remained in the Custodian's possession and was carried on for a few months, until October, 1918, when its property was sold to the present opponents. In 1898 a Mr. Sims was appointed

the selling agent for Robert Bosch, then carrying on business at Stuttgart, and in 1907 Bosch acquired from Sims the Sims-Bosch Magneto Department of the Sims Manufacturing Company. In 1907, Bosch appointed that company selling agents, the name was changed in 1908 to the Bosch Magneto Company, Ltd., and that company was in existence at the outbreak of war here. In 1916 or 1917, the Custodian of Enemy Property here seized the business after it had been carried on by the Ministry of Munitions, and ultimately, in 1917, Messrs. Vickers purchased the assets and formed the British Lighting and Ignition Company.

His Lordship: The English company was originally a German Bosch company?

Sir A. Colefax: Unquestionably; at the outbreak of war substantially all the shares were owned by Robert Bosch. The English company up to the outbreak of war imported from Germany. In America he thought the business was in American-made goods; in England the business was undoubtedly in German-made goods. He understood that from 1906 to 1911 the magnetos were not manufactured in the United States; the American company was selling Stuttgart-made magnetos. In 1911 the parts were imported and the assembling was done in America. In that year the American company acquired a site and erected the Springfield factory, which was planned to produce 100,000 magnetos a year. They commenced to manufacture in 1912 and by the end of 1915 all parts with quite unimportant exceptions were made in the United States at this factory and sold as Bosch magnetos with the country of origin plainly stated.

Counsel went on to say that in this case there was a gentleman named Heins, who formed with one named Clyne the original American company, and there was no question that there was always a close association between Heins and Robert Bosch. There had been started two actions in the United States, claiming in substance that the American Bosch Magneto Corporation was not the successor of the American company and had no right to the goodwill, &c., of that company. One of those cases had been dismissed for want of prosecution and the other for five years had never been brought to issue. On the other hand, Heins had, since this application was launched, registered in America the Robert Bosch Magneto Co. (Inc.), and the present opponents, the American Bosch Magneto Corporation, had started an action against him and that company in respect of that registration.

The hearing was adjourned.

Fox v. A. Jurd & Co.

In the Shoreditch County Court of October 22nd, before Judge Cluer, Isaac Fox, Clapton, E., sued A. Jurd & Co., Heatherley Place, N., to recover £13 5s., being the value of a radio set (£10), and the cost of repairs (£3 5s.). It was stated for plaintiff that he purchased the set in 1923, but finding something wrong with it took it to the defendants, who agreed to put it right for the sum named. The set was repaired but as it was still unsatisfactory the plaintiff took it back. On the following day a fire occurred at the defendants' premises and the set was destroyed. The Judge pointed out that the plaintiff would have to prove negligence on the part of the defendants; he should have insured the set himself. The plaintiff produced a note from the defendants showing that the set was guaranteed for a period of 12 months from mechanical defects, but the Judge said that the defendants had taken the set back to repair the defects and it had not been proved that the fire was due to their negligence. He accordingly gave judgment for the defendants, with costs.

First Unlicensed Radio Set Prosecutions.

On October 23rd, at the South London Police Court, Mr. Ratcliffe Cousins had before him the first prosecution under the recently-amended Wireless Telegraphy Act of 1904, of a person using a radio receiving set without having obtained the necessary licence. Counsel for the Post Office said that although the penalty on summary conviction was £10 and on indictment £100 or two months' imprisonment, they had no desire in the circumstances for a heavy penalty.

The defendant, H. Hazlewood, a wheelwright, living at Battersea, admitted the offence. The magistrate bound over the defendant in £5 under the Probation of Offenders' Act for six months.

In a similar case at the West London Police Court on October 26th, the summons was dismissed under the Probation of Offenders' Act upon payment by the defendant of 4s. costs.

Radio Instruments, Ltd., v. Charles & Co.

As reported in our last issue (p. 654), Mr. Justice Astbury granted an *ex parte* interlocutory injunction on October 13th restraining the defendants from selling the plaintiffs' radio transformers at less than the stipulated price. On October 20th the defendant appeared in Court and consented to a perpetual injunction, agreeing to pay the costs.

Marconi's Wireless Telegraph Co., Ltd., v. Fada Radio, Ltd.

In the Chancery Division, before Mr. Justice Astbury, on October 23rd, Mr. Whitehead, K.C., mentioned this case and said that he had a motion for an injunction. The action was a patent action and related to the plaintiffs' grid leak patent. He had agreed with Mr. Stafford Cripps, for the defenda to the following terms:—The defendants would undertak pay into Court within seven days the sum of £500 as secu for costs and damages and would undertake to keep an accou on these undertakings there would be no order on the mot except that the costs would be costs in the action.

His Lordship assented to these terms.

Trade-mark Applications.

The following are among the recent applications for Bri trade marks. Objections against any of the proposed ma may be entered within one month from October 21st:—

B.B.C. (lettering and design). No. 449,385. Class 8. Apparatus for us radio-telegraphy and telephony.—British Broadcasting Co., Ltd.

Davreach. No. 461,692. Class 8. Radio-telephonic apparatus.—E. Millingon, 5, Vaughan Street South, Birmingham.

Hyten. No. 462,173; and Hymeg. No. 462,174. Class 8. Electric sto batteries and accumulators.—The Edison Swan Electric Co., Ltd.

Stethophone. No. 461,616. Class 11. Instruments, apparatus, and trivances for surgical and curative purposes.—Western Electric Co., Ltd.

Published Specifications.

Compiled expressly for this journal by Patent Agents.
The name of the applicant's patent agent, if any, will be found on the prin specification.
The numbers in parentheses are those under which the specifications will printed and abridged, and all subsequent proceedings will be taken.

Electrical Contractors and Original Ideas.

WE must not allow ourselves to be so seriously engaged in discussing whether or not the electrical contracting business is degenerating that we shut our eyes to the real spirit of enterprise that is frequently displayed by some representatives of this much-maligned section of the electrical trade.

We can hardly remember the time when there was not something seriously wrong with contractors and contracting in the United Kingdom—at any rate on paper. It were the easiest thing in the world for the clever cartoonist to produce a series of progressive sketches of "the contractor—what he may become" either a great success and a help to electrical development, or a failure to himself and an undercutting jerry-working nuisance doing harm to everybody.

As far back as we can remember there were always both bad and good examples and, write all that we and our correspondents may, it always will be so. We look to the spread of registration to do much to relieve the situation, and we wish the movement full success wherever it is being tried. On that point our views have been so emphatically expressed from time to time that there is no need for their reiteration now. But we do want to have a word here directly in the ear of the electrical contractor himself—whether he is already registered, is about to register, or is indifferent to the whole question—on the subject of enterprise.

Large and effective showrooms are springing up in many parts of the country which contracting firms should find of great assistance to them both directly and indirectly, but however many centrally-placed showrooms there may be they will not be regarded by the enterprising contractor as a substitute for his individual display or his original policy and activity. Local individual ingenuity must be allowed the freest possible scope, and it must be remembered, too, that such ingenuity does not necessarily involve a big outlay in cash.

We are aware that there are cases where small men, as they are called, become discouraged in their local efforts because of what the authorities are doing to accelerate the rate of development, and they grouse and they grouse about rate-aided competition until their appeal to the public becomes more like a propaganda than a live, interesting, and convincing business-getting operation. They stand to gain far more in the shape of orders by getting on with their business than by indulging in exhibitions of ill-temper regarding inevitabilities.

We are sure that if the information could only be brought together, a fine record might be shown of hundreds of original individual efforts on the part of electrical contractors. It would go far to remove the effects of the fog of critical and belittling depreciation which seems to be the small man's heritage.

We welcome communications which keep the trade informed of the "stunts," if we may use a modern newspaper term, of the real live contractor, whether on this side of the Atlantic or the other. We would go so far as to urge him to concentrate at this moment on the production of stunts and yet more stunts to win the interest and orders of the public during these dark evenings when outdoor recreation for the average man and woman is practically non-existent and when shopping and the improvement of the home fill a large place in the pastimes of the winter.

If the electrical contractor will do as we suggest, he will develop as part of his business system a regular habit of seeking out new ways of securing work and sales. That there is room for ingenuity and enterprise in the electrical business we have not a shadow of doubt. Just as a type we may quote from our contemporary, *Electrical Merchandising*, the success that attended an original action on the part of a contractor, English by name but American in origin—J. C. English, of Oregon—who very much wanted to get hold of orders for electric fittings and fixtures required for housing schemes. Here we record from week to week the new housing schemes that are being undertaken in different parts of the Kingdom so that contractors and traders can bid for the electrical installation and apparatus work, if any. We, of course, have to leave it to the contractor to exercise his own brains in finding out how best he may succeed in such cases. Sometimes he tells us what he does and the result that ensues. In the case of Mr. English, mentioned by our contemporary, what he does is this: When a number of houses have been erected he sends a man to inspect them in their unfinished condition, with the lighting and other points wired awaiting the visits of the prospective tenant or purchaser. The said man before he leaves bends the wires into the form of a hook, upon which he hangs up a cardboard lantern sign stating that an estimate for the lighting fixtures required for "this home" is "ready for you" at the address of Mr. English. He jots down necessary data on a prepared form, and on this basis an estimate is prepared which is ready for the aforesaid tenant or purchaser. Of course, it is easy to anticipate a crop of objections from less pushful people who consider that their rights and privileges have been over-ridden, but we quote the result: inquiries are being received from 40 per cent. of the houses where the lantern signs are left. The lantern-sign effort does not stand alone—it is supported by appropriate correspondence of the follow-up order; but the estimate is ready—that is the important help that goes far to secure the business.

It may be that somewhat similar enterprise is being displayed by a number of firms here in connection with housing scheme operations. If so, we should like to have particulars for the assistance of others who are ready to avail themselves of such suggestions. We are sure that there is no lack of original ideas among electrical contractors; we merely quote the American example as a type that has just come before us. We should like to quote many of British origin if our readers will assist us.

Charges for Electricity in London.

In view of the attention which has recently been devoted in the City of London to the need for the charges for electricity to be reduced, it is of interest to direct attention to a communication that was issued by the Electricity Commission under date October 26th, 1925. Each of the companies affected by the London Electricity (No. 1) Act, 1925, has been notified that the sliding scale of prices and dividends provided for in that Act shall come into force as from the first day of January, 1926. A similar communication was also sent to each of the companies affected by the London Electricity (No. 2) Act, 1925.

The communication points out the importance of all necessary steps being taken by each company, without delay, to fix the standard prices for approval by the London County Council in order that the sliding scale may come into effective working at the earliest possible date. The hope is officially expressed that, even if it is not found practicable for the standard prices to be finally determined before January 1st next, each company will be able to announce such reductions of charges as may be warranted by a forecast of its prospective net revenue and of the appropriations thereof under the new conditions.

Booth's Circus.

Recent experiments instituted by the Advisory Committee on London Transport in Aldwych and elsewhere, with the system of continuous circulation of traffic in one direction, recall to our minds the fact that the late W. H. Booth strenuously advocated this system in our columns and elsewhere many years ago; although he may not have been the first to suggest the idea, his enthusiasm, combined with the obvious resemblance of the system to a circus, led to its being known amongst his friends (and who was not his friend?) as "Booth's circus." That the idea was practicable and possessed valuable features was undeniable; the only serious objection to it was the absence of any opportunity for pedestrians to cross the roads without bringing the whole system to a standstill, but this difficulty would be minimised by the absence of blocks, and would be felt only at times of exceptionally heavy traffic.

Booth's services to the community never gained the recognition that was their due. His interest in combustion prompted him to deliver lectures and to write books on the prevention of smoke from boiler furnaces, and his advocacy of the larger and higher furnaces which are to-day accepted as the correct practice for water-tube boilers was embodied in numerous articles which appeared in our pages some five-and-twenty years ago. A man of strong opinion, he had a fluent pen and a ready command of forcible language to drive his points home; and he used them both with vigour in support of his "circus."

Baking by Electricity.

We have frequently had occasion to point out that what electricity can do, cheaply and efficiently, is not to be determined by surmise or guess-work; only by actual trial over a sufficient period can its merits be truly appraised. On paper, the cost of industrial heating by electricity may seem unduly high, but in practice it is often found that owing to the adaptability of electric heaters, the ease with which the supply of heat can be controlled, the efficiency of utilisation which can be attained, and the saving in labour and capital cost, the actual outlay is less than with any rival heating agency, whilst the cleanliness and convenience of the electric way are unapproachable.

An apt illustration of this proposition is met with in the application of electricity to the baking of bread and pastry on a large scale. Hundreds of large electric ovens are in use in the United States. In our issue of October 23rd we described three notable examples of British baking ovens, and in the following pages Major T. Rich gives particulars of French practice. On account of its magnitude and nature, the baking load is of great value to supply undertakers. How many of them have canvassed the bakers in their districts?

Notes on Bakers' Electric Ovens.

With Special Reference to the Grenoble Exhibition.

By THEODORE RICH.

Among exhibits of interest to be seen at the Exhibition at Grenoble, some bakers' electric ovens take an important place. Two ovens, one for bread and the other for pastry, are shown in operation in a special pavilion, and a continuous pass-through oven is shown at work in a special building arranged for the demonstration of biscuit making by a Grenoble firm.

At first sight one would think that the only scope for the commercial bakers' electric oven would be in areas supplied from water power, as the thermal efficiency of the average steam power station—heat units in the coal

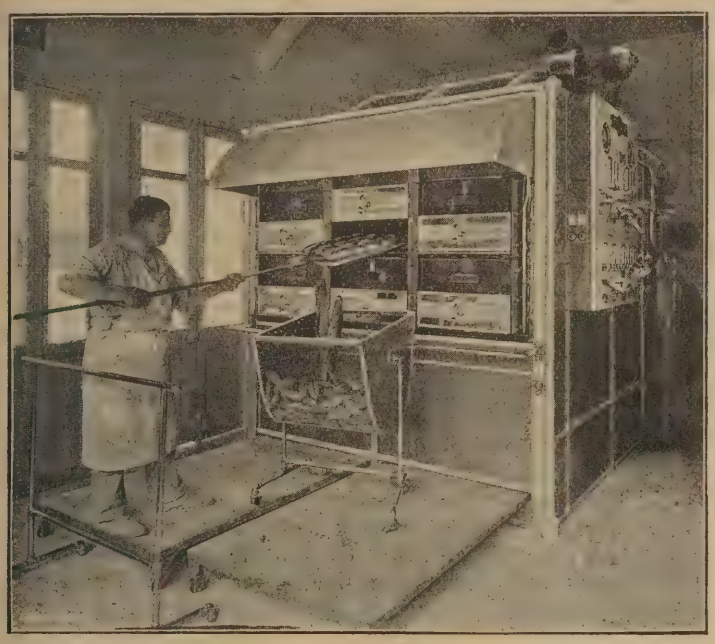

Fig. 1.—An Electrically-heated Bread Oven.

as compared with heat units available from the power station—is so low. But the question is how much of the heat in the coal used in the average bakery goes to heat the bread and evaporate the water content, and how much goes to heat up and keep hot hundreds of square feet of brickwork and flues and to heat up the air which passes through the furnace; and whether the electric oven which utilises such a very high percentage of the heat energy given in the form of kilowatt-hours will not prove an economic proposition, especially when many operating advantages are thrown into the scale. Coal is not the only factor in the cost account of a bakery, although an important one; wages, rent for the cubic space occupied, ever-increasing rates and taxes, and overhead charges generally add up to a formidable percentage during the year, and what is termed general convenience, to which a definite money value cannot be given, is also a material consideration.

Although it may be difficult for one baker, in the case of household bread, to charge more than another, and while people are conservative regarding the bakers they patronise, yet a high uniform quality of the product and an attractive appearance are very important factors towards the attraction of business. There is also the point that, owing to the difficulty of obtaining and keeping domestic servants, the restaurant habit has largely increased, and this has led to a demand for French and fancy bread for which a higher price can be obtained per pound weight than for household loaves. Besides the trade in pastry, in the United Kingdom there is perhaps the largest trade in Europe in such items as cakes, buns, scones, and such like, where the selling price in proportion to weight is very much higher than that of bread, and where quality as expressed in lightness, texture and appearance counts for so much. With regard to such products, the proportion of fuel costs to total costs tends to be smaller than with bread, and the various manipulative incidentals can easily mount up to a material percentage of costs; for such a trade, the electric oven has special advantages as compared with the old arrangements.

Underground Bakehouses.

In the past the use of the old-fashioned brick oven, with its flues, necessitated construction on solid foundations, and this fact encouraged the construction of underground bakehouses, a point that sociological enthusiasts usually overlook; the heat given out by the brickwork, the poor ventilation which so often existed below street level, the stuffy and objectionable atmosphere, and the hot, perspiring operatives, the presence of coal and dust and often bad illumination all combined to encourage vermin, dirt, and general insanitary conditions. It is not astonishing therefore that in some of our towns many persons who are British in race and instinct hesitate to enter a trade with such a reputation, and we find that too often men for such work come from the other side of the North Sea, a serious matter considering the seemingly chronic unemployment which exists among our own people at the present day. Despite the efforts of the professional political agitator who seems to live on grievances and unemployment, amelioration of the general conditions under which the craft of bakery is carried on can hardly fail to attract a good class of British labour into the trade.

It is also recognised nowadays that persons in an apparently healthy condition can be the carriers of dangerous diseases, and this encourages the demand that food, so far as is reasonably possible, shall be untouched by hand during preparation, and shall be comparatively free from contamination from the time it is prepared to the time it is delivered to the customer.

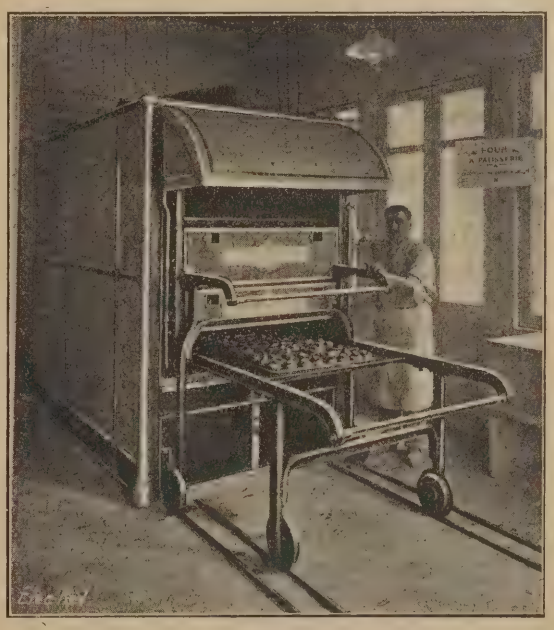

Fig. 2.—An Electric Pastry Oven.

It is relatively more important to take special care over an absorptive substance like bread that is eaten without further treatment than to bother about plate-

glass windows for such a commodity as meat, which in England is always cooked before it is eaten. Master bakers have in recent years done a good deal to improve their establishments, and to remove the reproach that medical men have often levelled against them, but there may be still some master bakers who would not like their lady clients to inspect without notice the exact conditions under which their bread is made and baked.

It is not in the interests of the community as a whole

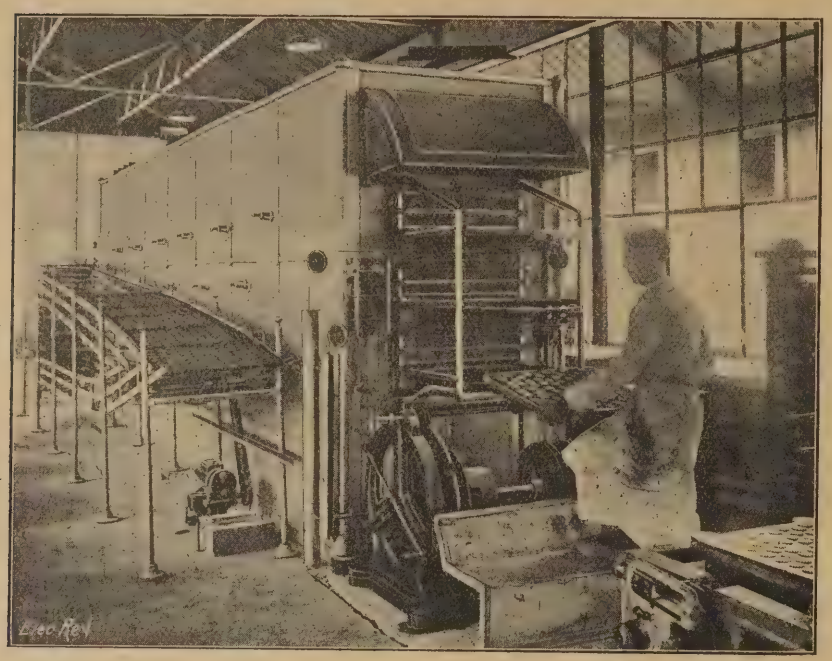

Fig. 3.—An Electric Biscuit-baking Oven.

that large octopus concerns should be able to squeeze smaller tradesmen almost out of existence, and there is a feeling in some quarters that in some classes of trade and business, people with ample capital resources, who can afford to wait, have encouraged Government and local rules and by-laws which, however intrinsically desirable, have made it more difficult for small businesses to exist. There is a demand, therefore, for appliances which can be produced and sold at a reasonable capital cost, which in small sizes, through facility of manipulation and adjustment and general efficiency, will enable the small trader to compete with large widely advertised concerns. Large undertakings often attract the public to less favourably priced articles by selling specific items below prime cost, a practice which acts unfairly towards those who try to make a living in the line affected by such "dumping"; it is open, however, to the smaller man to show the public the attractive up-to-date methods by which his wares are made, and thus gain an advertisement which is more lasting than some of the vulgar puffing which is so much in vogue at the present day.

Electricity to Aid the Small Man.

Electricity, when it is intelligently handled, and not tied up with too many fads and capital-wasting restrictions, can be a boon to the small employer and tradesman. In some parts of the Continent, even in small towns and villages, where electricity supply is available from high-pressure mains, an astonishing variety of electrical appliances for industrial use can be found, and in such areas electric ovens will undoubtedly make their influence felt. In the North of England, near the coal pits, electricity is, as a rule, cheaper than in the South, but considering the valuable nature of a baker's oven load, power supply authorities in many Southern areas, especially considering the high power factor, should be able to encourage the use of such appliances by their customers.

The heavy cost of British ca'canny coal during the last decade has encouraged the development of water power in Southern Europe; this has been a factor towards improvements in many electrical appliances, among them electric ovens, the use of which is spreading to areas where power from steam stations only is available.

The above ideas arose after an examination of the ovens exhibited at Grenoble on the "Media" system, the design of which is the outcome of 13 years of experience, a number of features being the subjects of patents by Messrs. Antonelló & Orlandi; they are constructed in France by the Société Générale des Fours Electriques, of Grenoble, a firm that specialises in ovens for the preparation of food. They are made in a number of sizes, from a small confectioner's oven which takes on an average 2 kW to operate, to a baker's oven which will handle about 12 cwt. of bread per hour; up to date the makers state that there are over a thousand of various types in use in various parts of the world. A number of ovens of this kind are at work in Paris and in other areas where power is supplied from steam stations, and it is of interest that the same makers have on order for use in the Paris area an oven taking up a floor space of three metres by four metres, which has a baking surface of 32 square metres (340 sq. ft.), and which can bake in eight hours 90,000 pastries and five tons of bread. The normal types are made for bread, pastry, or biscuits, and comprise one, two, or three tiers. One of the smallest bread ovens of this type is made with a baking surface of 2 square metres; it takes as a maximum 10 kW, and can produce 55 to 77 lb. of bread per hour with a consumption of between 0.1 and 0.16 kWh per lb. The bread and pastry ovens are designed for a maximum working temperature of from 300 to 350 deg. C. (570 to 660 deg. F), although the heating elements and other parts are arranged so that a very much higher temperature can be withstood without damage. The heating elements are formed of spirals of non-rusting wire. Most of the pastry ovens supplied by this firm have been connected to steam-driven electricity systems.

Fig. 4.—A Restaurant Pastry Oven.

A 60-kW Bread Oven.

The bread oven shown at the Exhibition is illustrated in fig. 1; it is the largest size made for the use of general bakers. There are two chambers one above the other,

each with a surface 2 metres by 3 metres, that is to say, about 130 sq. ft. total baking surface. There are six balanced doors, of a non-radiating type sliding in grooves, arranged to give easy access to the upper and lower chambers; one can operate the doors in rotation, and therefore the loss of heat through the opening of the doors can be reduced to a minimum. An experienced baker, with only one mate, can produce up to 220 kg. (484 lb.) of bread per hour. The space taken up is 2 metres 40 wide (7 ft. 8¾ in.), 3 metres 30 (10 ft. 8¼ in.) deep, and 2 metres 50 high (8ft. 2 in.), including all gear, &c. Its maximum consumption is 60 kW; the mean consumption varies from 0.1 to 0.136 kWh per pound of bread, depending on the type of bread and loaves to be baked. It should be noted that a greater weight of English bread can be got on to a given area than is the case with most classes of bread made on the Continent. The ovens have a slight slope towards the front to aid the charging and discharging. A chamber is arranged underneath to hold bread during fermentation. In order to facilitate the operation of the upper chamber, especially where the operatives are not very tall, there is a sliding platform which can be pulled out as shown in the illustration.

The total weight of the bread oven empty is about 5 tons, and when spread over about 85 sq. ft. this gives 135 lb. a sq. ft.; when the weight of bread is added, it will be seen that, owing to the absence of the necessity for any brick flues, it can be placed almost anywhere.

The Pastry Oven.

This has also two chambers, one about 6 in., the other about 10 in. high. There are two baking plates; each plate rests on a sort of trolley, so that it can be pulled out with the greatest ease when the balanced door is raised. The baking plates can be lifted off and replaced by a new batch, pushed in, and the door closed again almost in a matter of seconds; the loss of heat is therefore very small. Each oven has a working surface of 2 square metres. This oven takes a maximum of 22 kW, with an average under normal conditions much less than this. It is illustrated in fig. 2.

The following features apply to both types of oven. Each type is self-contained; it is made of metal, it requires no foundations and no expensive flue; it can be dismantled with ease, so that the owner of an oven could, if he so desired, take one to an exhibition or similar undertaking without great expense for skilled labour. The oven walls are so well insulated that, so far as the baking is concerned, the temperature of the bakehouse remains very low; the outside walls remain quite cool, and as the general appearance is pleasing, the makers recommend that the pastry ovens should be placed, where possible, inside the confectioner's shop and operated in view of the public as being a valuable advertisement. Some of those connected with the direction of the Société des Fours Electriques are gentlemen with years of experience in practical bakery, especially with regard to high-class French bread, and the ovens have been designed not merely to give convenience of regulation, but also to minimise the number of movements required for each operation on the Taylor system. Each oven chamber is fitted with a pyrometer, and top and bottom heat can be switched in and out and regulated independently; by this means the rise, thickness, colour, and humidity of the product can be influenced as desired, and an adjustment obtained which is out of the question with fuel-heated ovens. Owing to the disposition of the heating elements, a high radiating efficiency can be obtained. The interior of each chamber is continuously illuminated, and the process of baking can be observed without opening the main doors. There is a pilot light belonging to each chamber; this tends to prevent the waste of energy which would go on if it were left switched on with the oven empty. When baking bread, the oven can be raised to the required temperature in about 20 minutes; this tends towards economy in labour. To a considerable extent the power required can be regulated to suit the quantity of material to be baked.

An electrically-heated steam boiler of a patented type is attached to the exterior of the ovens on one side. By means of suitable connections steam can be admitted to the oven chamber when it is required to give the bread the maximum brightness—a matter of importance with French bread—and by means of steam the rise of the bread can also be controlled. The boiler has a very rapid action; it can be used to supply hot water at any temperature required when the oven has been shut down and no hot water is available from the condenser. A condenser is placed over the oven; it warms the water by means of the water vapour rising from the bread which is being cooked on a sort of regenerative principle, and the hot water required for the kneading can be obtained from this source. Ovens can be arranged so that one chamber is specially suited for pastry and the other for bread. The same makers supply a small pastry oven which takes a maximum of 3½ kW and a mean of 2 kW; it is designed to meet the requirements of small confectioners, tea rooms, schools, hospitals, institutions, and hotels. The oven proper is 1 metre high, 1 metre broad, and 1.25 metres deep. It is placed on a wooden stand, which serves at the same time as a cupboard. This tends to show how well it is insulated. It can bake about 1,000 little pastries in four hours or 20 lb. of bread per hour; the baking surface is practically 40 in. by 24 in. by 7 in. high. Fig. 4 shows one of these modified for making pastry in a restaurant in view of the public.

The continuous biscuit oven made by the same company is on view in connection with a demonstration of biscuit making arranged by Messrs. Brun, a large biscuit firm in Grenoble. It has a capacity of 400 kg. (880 lb.) of biscuits an hour. The biscuit trays are pushed in on one side from the paste-rolling and biscuit-stamping machine and slide out at the other ready to be placed on cooling racks (fig. 3). This machine takes 65 kW in operation. They are also made in small sizes. The electricity supply to Grenoble is almost exclusively from water power, and coal is very dear; such an oven might prove attractive in districts supplied by waste-heat power stations and also in countries like Canada, where there is so much water power. One generally associates the operation of model apparatus with large concerns, but the particulars supplied by the makers show that, provided electrical energy can be had at reasonable rates, the electric baking oven is within the reach of quite small establishments. Where a new bakery is to be put up in the middle of a big city the saving in cost of foundations, brickwork, and flues would amount to a material item, and provided simple arrangements can be made for the hoisting of flour, there should be little to prevent a bakery being put in an upper, if not on the top, storey of a building, which might be a great convenience in the case of the bakery of a hotel or institution. From the point of view of hygiene, probably no method of baking can compare with the electric oven.

Cost of Energy.

The Compagnie Parisienne de Distribution d'Electricité, the supply company for the major part of Paris, which operates with steam power only, and in whose area of supply a number of ovens have been installed, has informed us that on October 7th last (when the exchange was in the neighbourhood of 100) its price for energy for purposes other than lighting, that is to say, for electric ovens and electric motive power, was 0.816 fr. low pressure and 0.582 fr. high pressure per kilowatt-hour, coal then being 130 fr. a ton. At an exchange rate of 100, that would mean 1.95 and 1.31 pence respectively, with coal at 26s. a ton. The above prices are subject to rebates calculated quarterly, which are based on the load factor of the plant installed; the day rebate may reach a maximum of 40s., and the rebate for night time 45s. In France, where power comes from a steam station, there is a price variation depending on the price of coal.

The electric oven is no mere fad; it has come to stay.

The Commercial Motor Exhibition.

Some Notes and Comments on Electric Vehicles and other Exhibits.

Few industries in Great Britain have developed so strikingly during the last two years as that connected with the manufacture of mechanically-propelled road vehicles for general commercial purposes. The numbers of registered goods-carrying vehicles and hackney carriages, which amounted to 100,000 and 60,000 respectively in 1919-20, had increased by 50 per cent. at the time of the last commercial motor show in 1923, while to-day the figures are estimated at 224,287 and 98,833, and the seventh International Commercial Motor Transport Exhibition, staged by the Society of Motor Manufacturers and Traders, Ltd., at Olympia, London, from October 29th to November 7th, has proved that more real progress in design has been achieved during the period that has elapsed since the 1923 show than in any equivalent period.

Whilst trade in goods vehicles is progressing, if somewhat slowly at the moment, passenger transport is growing in a remarkable manner, particularly in connection with omnibus services, and the most noteworthy developments are therefore naturally seen in passenger-vehicle design. The exhibits are representative of the leading makes of petrol-, steam-, and electrically-driven vehicles, and the specialised industry of coach and body building. Amongst the 68 different makes of vehicle displayed, seven manufacturers of "electrics" are exhibiting a number of battery-driven trucks, vehicles, and trolley-'buses. So far as the passenger-carrying models are concerned, practically all the latest embody a chassis having a low frame level, and considerable attention is devoted to efficient braking, an increasing number of chassis being provided with four-wheel brakes. To-day the Municipal Tramways and Transport Association, according to the programme, is to discuss local authorities' problems in connection with the operation of omnibus services, at the last of the six conferences arranged at the Exhibition.

Electric Trolley 'Buses.

The ever-increasing popularity of the railless car is once again made manifest by the decision of the Birmingham Corporation to increase its fleet of double-deck

Fig. 1.—A "Railless" Trolley 'Bus.

cars, twelve of which type have operated in that city for several years with success, and have had the effect of increasing the traffic returns of a route which was considered to have reached the limit of its capacity when operated by tramcars. The large seating capacity and the "all-weather" adaptability are features which cannot be overlooked. A low-floor car of the open-cab type that was recently placed in service at Southend-on-Sea is shown in fig. 1. Made by Railless, Ltd. (proprietors: Short Bros., Ltd.), who claim to be pioneers in this form of passenger transport in the British Empire and China, the 'bus is a single decker, whereas the show model is built to take 52 seats, the lower and upper saloons each being fitted with 26 seats. A feature of the upper saloon is the provision of drop windows at the sides, these being easily adjustable and operated on the "lazy-tongs" principle. The current-collecting gear consists of "Railless" vertical trolley stands equipped with two tapering booms approximately 19 ft. 6 in. in length, mounted on channel supports.

Specially designed for the production of the low-frame chassis, the rear axle (by the Kirkstall Forge Co.) is of the double-reduction type, consisting of worm gearing and of a pinion and internal ring gear bolted directly to the road wheels. The internal gear is totally-enclosed, being grease tight, water, and dust proof. By removing the road wheels and driving shafts, the worm and differential gear can be lifted from the axle casing, through the trap provided in the floor of the car, as a complete unit. Timken taper roller bearings are employed for mounting the wheels, and two independent sets of brakes are fitted to the double deck car, operated in conjunction or independently. The emergency brake acts on the rear wheels and is applied by a pedal. The electrical equipment fitted to this particular model includes two motors of 35 h.p. (by the English Electric Co., Ltd.) arranged in tandem directly on the chassis frame, which is so well sprung that independent springing of the motors is quite unnecessary.

A 36-seater single-deck trolley 'bus was also shown on the stand of Messrs. Richard Garrett & Sons, Ltd. It is driven by a single 50-h.p., 1,060-r.p.m. "Bull" motor, and is fitted with pneumatic tires; in addition to front-wheel brakes, a Westinghouse air brake operates on the rear wheels. The side entrance door is 4 ft. wide.

Petrol-Electric Vehicles.

Amongst the exhibits of Tilling-Stevens Motors, Ltd., is a petrol-electric chassis (fig. 2) with a 50-h.p., 4-cylinder engine and a worm final drive. The maximum load capacity is 5 tons, including the body. C.A.V. constant-voltage equipment is provided for electric lighting. A similar chassis is fitted with a single-deck London-type omnibus body with seating accommodation for 30

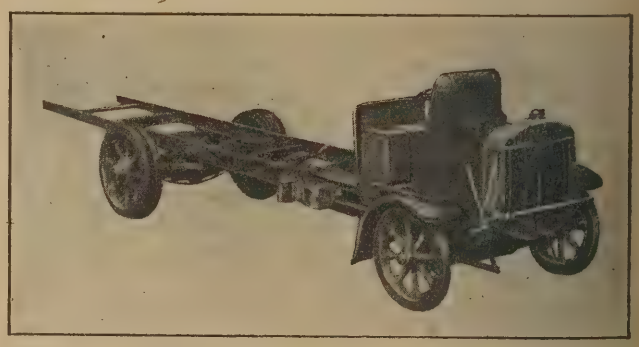

Fig. 2.—A 50-h.p. Petrol-electric Chassis.

passengers. In this case the makers' direct-lighting system is installed, the electricity being derived from the chassis dynamo.

Battery-propelled Lorries and Trucks.

Several makes of battery-propelled chassis are on view. The "Garrett" 2-ton vehicle is driven by a single "Bull" 9-h.p. motor, and the control gear is so arranged that the vehicle can be steered from the pavement, thus obviating the necessity for the driver to mount into the cab on each occasion as the vehicle moves from door to door for refuse collection and similar purposes.

Messrs. Ransomes, Sims & Jefferies, Ltd., exhibit one of their standard 3½-ton "Orwell" electric tipping

wagons (fig. 3) for refuse collecting. These electric vehicles are used by nearly 40 cleansing departments, also for highway maintenance, overhead tramway work, street watering, and commercial transport in towns. They also show the C.11 model electric industrial truck, which is fitted with 4 ft. 16 in. wheels for use on rough ground, and with an electrically-operated elevating platform, by the use of which, in conjunction with several trays or stillages which can be loaded at convenience, transport is effected without loss of time in loading and unloading, the truck being kept in constant running service.

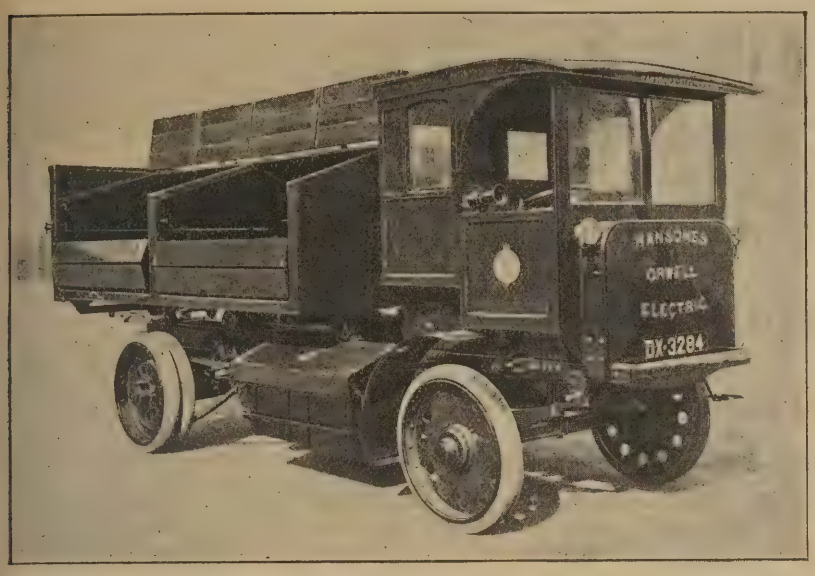

Fig. 3.—An "Orwell" Electric Tipping Wagon.

The "Ransome" runabout crane will travel, turn, hoist, and derrick under its own power, turning about its own centre like a turn-table, and by reason of its mobility is suitable for the many jobs of daily occurrence outside the capacity of the ordinary lifting appliances, as indicated in fig. 4, and have hitherto been performed by hand. These cranes are used by the Port of London Authority, the Mersey Dock and Harbour Board, the L.M. & S. and L.N.E. Railways, and other leading undertakings throughout the country.

Fig. 4.—An Electric Runabout Crane.

(To be concluded.)

An Economical Heat and Power Scheme.

The Electrical Installation at the Bucklow Institution, Knutsford.

An electrical installation has recently been completed at the Bucklow Institution, Knutsford, which presents some interesting features. Steam had previously been used to a considerable extent for heating the building and also for domestic hot-water purposes. A scheme was prepared by Messrs. Cramp and Frith, consulting engineers, of Manchester, whereby all the energy required in the Institution for lighting and power could be generated electrically by using a back-pressure engine as a prime mover, and utilising the exhaust steam for the work previously done by live steam direct from the boilers. By carefully proportioning the plant and by the installation of a storage battery of about 600 Ah capacity, it was found possible to provide all the heating, lighting and power necessary without any increase in the steam drawn from the boilers; thus for a very slight increase in coal consumption due to the higher pressure of steam, the Institution now has its lighting and power services provided for electrically.

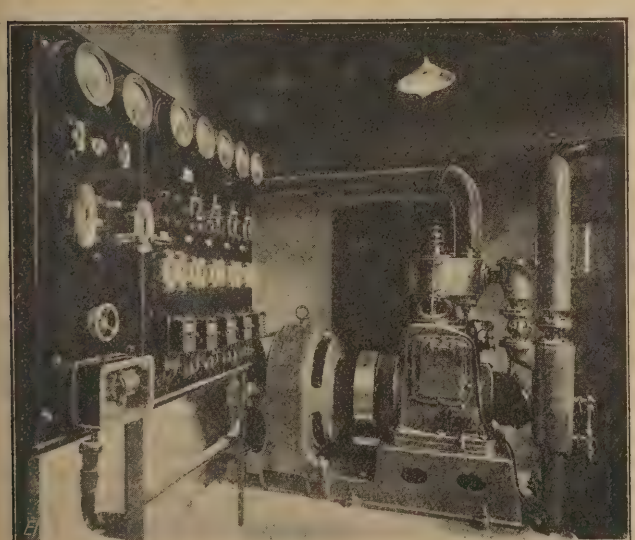

Fig. 1.—Generating Plant and Switchboard.

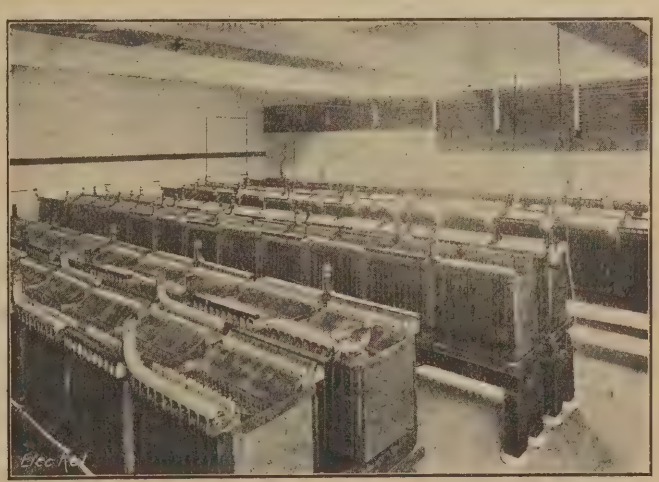

Fig. 2.—Storage Battery.

The plant comprises a 32-h.p. high-speed enclosed steam engine, fig. 1, designed for taking steam at 100 lb. pressure, and exhausting against a back pressure of 5 lb. This is directly coupled to a 20-kW 200/280-V d.c. generator, arranged so as to supply direct or for charging the storage battery. The battery, fig. 2, consists of 106 cells, and is contained in a large and up-to-date battery room.

The total number of lamps installed is between 400 and 500. The electrical plant also provides energy for a 15-h.p. motor used for driving the laundry machinery, which was previously driven by a low-speed horizontal steam engine. Since installing this electric motor, there has been a very considerable improvement in the operation of the laundry machinery; it deals with all the variable loads due to hydro extractors, &c., without any noticeable variation in speed, whereas when operating with the steam engine, excessive speed variations were frequent.

The exhaust steam from the engine passes into an exhaust header, one "way" from which is connected to an atmospheric exhaust pipe with an automatic valve designed to release the steam at 5-6 lb. pressure. Two of the remaining "ways" on the header are connected to calorifiers which provide a supply of hot water to a 750-gallon storage tank, the water being intended for domestic purposes in the kitchen, &c. Another "way" on the header provides steam for a "Recto" apparatus, which is used for re-heating the return water from the water heating system. In actual operation no steam passes out of the atmospheric exhaust pipe, and it has been found possible to provide a constant supply of hot water, although the engine is shut down each week-end from Friday afternoon until Monday.

The whole of the work was carried out by Messrs. Drake & Gorham, Ltd.

The Uruguayan Electrical Market.

A Field for British Enterprise.

(From our own Correspondent.)

Electrical wiring is undertaken in Uruguay practically without any restrictions either as to kind or quality. When, however, it is used on public supply systems, such as the half-dozen owned and operated by the Usinas Electrícas del Estado, the works inspector has to approve of all jobs before connections are made to the lines. This regulation, it is considered, gives greater latitude to the wiremen than is desirable, since industrial inspectors vary in their estimation of the quality of the work carried out. There has been of late a strong inclination in Uruguay to combat certain European influence, since this has always meant low-grade material. Simultaneously with the formation of the Electrical Engineers' Association in Buenos Aires, the Administration of Central Stations in Uruguay formulated a set of rules which have almost eliminated the use of poor material, and have done much to destroy the damaging practice with which customers had been undoubtedly afflicted in past years.

The Bandá Oriental (Republic of Uruguay), with its total area of 72,180 sq. miles and 1,663,000 inhabitants, offers many opportunities for the sale of electrical goods, not alone in the capital, Montevideo, where there are over 400,000 people, but in the suburbs and seaside resorts outside it. There is no longer any private supply enterprise, since the Government long ago decreed that all public services should be considered State monopolies. The electricity supply is cheap and the undertakings are well managed. The General Department of the Government Central Stations, which has its headquarters in Montevideo, administers the affairs of all power stations through one central organisation, staffed by capable engineers and local representatives allotted to each of the four more important cities. No small part of the prosperity achieved is due to the policy initiated from the first, and strictly maintained, of appointing only competent and intelligent men entirely without political bias or influence as members and officials. All purchases of supplies are effected by public bids, as in the case of the insulated copper wire purchase mentioned in "Business Notes" in our issue of October 23rd.

Montevideo, like the sister capital, Buenos Aires, is among the more progressive of the South American cities. Especially has this been the case in the adoption of the latest electrical devices irrespective of origin. One of the more notable features of this policy has been the construction of a large and admirably-equipped showroom containing working models of practically every well-known electrical device for the household, and including, of course, several types of water-heaters, cooking ranges, &c. These models are arranged for immediate operation under conditions approximating closely to those of actual service. The prospective customer is thus enabled to determine readily how far any particular apparatus will be likely to suit his or her house and obtain a precise estimate of the cost of the appliance and also of its running expenses after its installation. An additional advantage is offered by the remarkably low rates charged for energy for both cooking and heating. In Montevideo, as in other Uruguayan cities and, indeed, throughout the "camp" (or country where the farming population resides) the sale of heating and cooking apparatus is becoming increasingly important. In the winter months the temperature is sufficiently low to call for the provision of some artificial warmth, and the summer heats are torrid enough to call for the use of powerful electric fans. The type of house warmer most in demand is the small focusing reflector pattern. A considerable trade is done in this type of heater with the adjacent city of Buenos Aires, where it is manufactured. The same appliance is also furnished with fixtures to provide hot water and to make toast. The Argentine article is not made of very good material, nor is it of attractive design. Cheapness, however, is considered before good quality, and the apparatus sells at prices considerably lower than those asked for similar imported goods. Were it possible to place upon the Uruguayan market a British-made heater at the same price as the Buenos Aires article, there is no question that it would be preferred, since "British made" attached to any article offered for sale in South America becomes a *cachet* of value. In the central station workshops of the Usinas Electrícas del Estado a larger type of heater is made, after designs by one of the State engineers. This type, although little better in quality than that of Argentine origin, has the same advantage of cheapness, since the raw material is obtained locally and the finished product is not called upon to pay either import duties or freight. The demand for this heater has not, however, been as extensive as was hoped. Consumers usually prefer to pay a rather higher price for a superior foreign article, provided this comes within their means.

Montevideo has long been an attractive market for the sale of cooking ranges. The Usinas Electrícas, which holds a fair stock of these appliances, has no prejudices against foreign-made articles, and allows its customers to make their own choice without attempting to influence their judgment. In the display room are to be found many kinds of ranges—American designs predominating, and German makes coming next—which can be demonstrated to prospective customers. Special rates are quoted for domestic supplies. The most popular ranges are fitted with four plates, but there are no ovens, these best meeting the peculiar conditions of Uruguayan households. In view of the heating element being more liable to damage when exposed, a form of protective covering must always be provided.

The voltage is 220, but in ranges thus fitted it has been found that the breakage ratio is higher than in connection with a voltage of 110. In these circumstances the free allowance of renewal parts is always found advantageous. In order to encourage the further use

of cooking ranges in the City of Montevideo, the central station charges only four centesimos per kWh for the first 2,000 kWh consumed, and 2 centesimos for each kWh above that quantity.

An increasing sale for other heating devices, such as flat irons, bread toasters, curling tongs, and immersion heaters has lately been reported. Water-heaters of sufficient capacity for general household purposes have an extensive sale in the "camp." Since few Uruguayan houses are equipped with a hot-water storage tank, there is also a demand for the instantaneous type.

Correspondence.

Correspondents should forward their communications **at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

The Æsthetic Aspect of Advertisements.

I was more than gratified to read in to-day's Review Mr. Twigg's answer to my letter, and in view of the great interest which the competition must of necessity attract to your advertising pages, perhaps you will permit me to answer not only Mr. Twigg's gentle impeachment of my irrelevance, but to meet him on his own ground, or rather that plot to which he has carried his defences.

In your correspondent's opening paragraph in his letter of September 26th, he refers to "Advertising Street," by which I judge he means the advertising world of to-day; in fact, he develops this theme, and makes the significant statement that "some hurry through without stopping—these are wise." One might justifiably assume that Mr. Twigg is not satisfied with modern advertising, charging it with vulgarity, exaggeration, and irrelevance, to say nothing of theft from the masters of our tongue.

Now to come to the æsthetic aspect—dare your correspondent suggest that modern advertising does not pay? Surely the capacity for a return on money expended is the standard by which a commercial effort must be judged. It does pay, because it is a young craft evolved from bitter practical experience, proved, and successful.

Why, therefore, should we be æsthetic, why artistic? What better criterions can we follow than those demanded in your competition, in which artistic qualities come a very definite last? We at any rate who are concerned with the prosaic manufacturing branch of the electrical industry on its publicity side have a definite duty to perform—to echo our firm's reputation and policy, to give to the purchaser our firm's message as if it emanated from a solid British concern, not a Chelsea studio. In our factories we do not lay Persian carpets in our foundries, or fit our lathes with gold tassels, but, to abandon an exaggerated simile, we build machinery for efficiency and life in Great Britain and not for beauty.

Can Mr. Twigg tell us why we should not convey these ideas in our advertisements, and why we should not first of all concentrate on:

(1) Power of immediate attraction,
(2) Qualities compelling continued attraction,
(3) Boldness of design,

with "artistic arrangement," a fourth desideratum capable of interpretation in its widest meaning—"neatness"?

I cannot fight a worthy opponent from the shield of a pseudonym, and therefore beg to subscribe myself—

J. P. F. G. Turner
(Advertiser).

Liverpool, *October 30th*, 1925.

Non-Dazzle Car Lighting.

Many years ago the following experiment was made:—A very bright electric lamp was suspended without any reflector, or shade, from the roof of a large building, the walls and roof of which were very dirty, and the pupil of the eye of an observer was measured. Then, without making any other alteration except placing a large white disk behind the lamp, the pupil of the eye of the observer was again measured. In the second case, although a larger amount of light was falling on the pupil of the eye of the observer, the pupil was larger, showing that there was less strain on the observer's eye. Would not the dazzle of a motor-car's lamps be reduced if the motor-car itself were made visible to the observer by allowing some of the light to illuminate the motor-car?

Experiments in this direction might lead to useful results.

Non-dazzle.

October 26th, 1925.

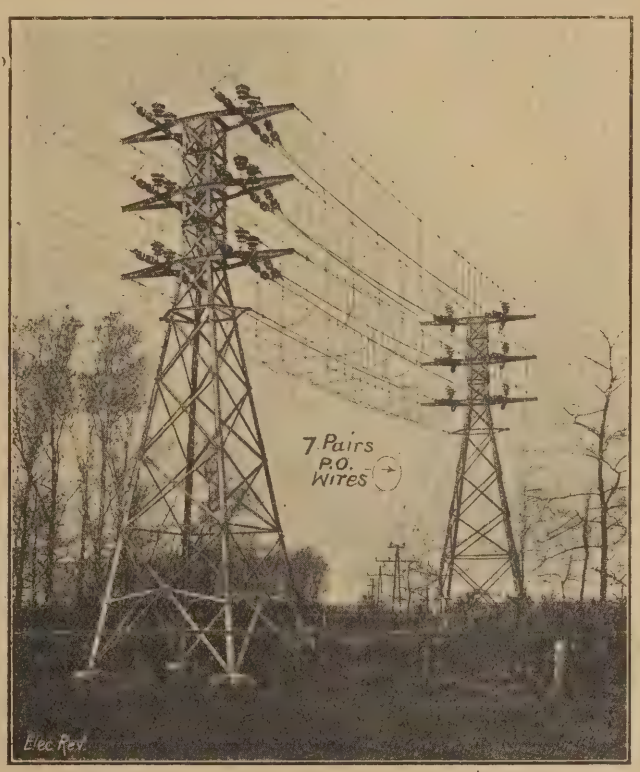
Combustion Engineers.

I have been interested of late in the advertisements appearing in your columns under the heading of combustion engineers, and am surprised at the amount of salary offered for such positions.

A combustion engineer must be thoroughly proficient in all power plant problems; he is, or should be, entrusted with the handling of the largest item of expenditure in any power station, *viz.*, the fuel; and he can often effect economies covering many times the salary paid. And yet supply authorities place this class of engineer in the lowest grade. Perhaps these authorities and their managers do not yet realise that there is something more in combustion than merely carrying out a few tests.

American power plant managers are, however, realising this, and in many instances the combustion engineer is among the highest paid officials.

Combustion.



London, *October 30th*, 1925.

Rural Electricity Supply.

It is quite true I am not that kind of "big man" who would subside immediately Mr. Bartholomew ordered him to do so. This is the typical "I have spoken" attitude of the Post Office which we are out to combat.

Mr. Bartholomew's simile of St. George and the Dragon is excellent. He has produced the exact picture of the situation. We must slay the dragons of unreasonable rules and regulations which are neutralising our efforts to be useful. I do not think anything I have written could hurt the feelings of the higher officials now I know that Mr. Bartholomew shyly and wisely disclaims any certain right to be one of their number. They cannot possibly read the Electrical Review; if they did T.E. 80 and similar concoctions would not exist in their present unreasonable form, and I would have nothing to write about. Unless Mr. Bartholomew seeks audience with them and "tells on me" they will never know!

The short answer to Mr. Bartholomew's belated indignation as to my use of the word "paltry" in connection with short

Power Lines Crossing Telephone Lines.

exchange interconnection lines is the enclosed photo of an actual crossing recently erected by the North Wales Power Co., over this same Northwich to Winsford local line. This is a cheaper design than the one submitted to me officially as that approved, but it is "accepted" as a sort of concession. It costs about £250. We are, in effect, asked to plant two more of these monstrosities on an innocent and hitherto smiling countryside. Your readers will now be able to decide if the Post Office line is a "paltry" thing to have required this fearsome structure, designed apparently to cope with elephants in bulk rather than electricity. Underneath is the Post Office line. It would need a great deal of exaggeration to make it reasonably visible; in fact, it has failed to affect the plate. There are seven pairs of very thin 'phone wires passing where I have indicated by a ring.

I am sorry that Mr. Bartholomew's description of the heavy thinking which goes on in connection with these projects leaves us to seek further for an explanation. I have just remembered that our proposals to cross were dealt with in the holiday season; perhaps the office boy had to deal with them. Seriously, look at the picture and remember that I saw about 1½ miles of this 'phone line put underground about 18 months ago. One trembles to think what would have happened to our Winsford calls if a few yards more had been laid underground by mistake! It would be laughable if it were not so serious.

Mr. Bartholomew, being a "big" man, has run away from my challenge to produce figures to support the Post Office

refusal to put this line underground at our cost. I tried hard to get them before this discussion arose. The longer the figures are kept back the more the suspicion grows that there are no figures; that the line could be put underground, and that all that prevents it is an old order that this line is to be overhead in the country. The order was made, I suggest, on the ground that the line is too paltry to be put underground in the country on the score of cost, and that as we are prepared to pay it is merely inertia and indifference which stand in our way.

I suggest that Mr. Bartholomew makes too much of the generosity of the Post Office in putting subscribers' lines underground *at our cost*. It is their well-known policy to get them underground, even at their own cost, as soon as they can. I expect they would be glad if we asked and paid for them all to be put underground forthwith!

I am hoping that crossings such as that illustrated will not be required in future, unless the Electricity Commissioners are convinced that no alternative is possible. I even suggest that the Commissioners should take the initiative and scrutinise proposed crossings when proposals are put forward, to see that money is not wasted in unnecessary elaboration. After all, these transmission lines may be purchased later on by a Joint Authority, and the public will then have to foot the bill. If the Commissioners do not exercise the necessary scrutiny, this can be assured by an appeal under the Electric Lighting Clauses Act, 1899. The Commissioners have power to decide whether a requirement of the Post Office is reasonable or not, and may decide what shall be done.

Mr. Hunt, of Haywards Heath, exposes the Post Office "second comer" injustice very neatly. His belief that P.B.J. (allowed in practice for the last 10 years or so with excellent results) will help him on low-pressure a.c. crossings is to have a rude shock. Post Office officials have just dug up a forgotten clause in T.E.80 which forbids it for a.c. exceeding 125 volts, and the word has gone round that T.E.80 must now be enforced. This means that a.c. overhead distribution is killed—unless we appeal to the Commissioners.

I envy Mr. Hunt his sectional engineer who will stretch a point, but I am sorry he has mentioned it publicly as someone may report the statement at headquarters. The whole system of Post Office organisation is contrary to any such thing as elasticity.

Mr. Walker's excellent letter hits the supply engineer very hard, and rightly so. We have no right to make freak rules, as uniformity is as necessary in this as in periodicity and voltage. The electrical industry seems to exercise an uncanny fascination upon all concerned, and some who are not, to make rules.

If you have spare space perhaps you will publish the annexed extract from the new Mid-Cheshire Conditions of Supply:—

> Wiring must be carried out in accordance with the Institution of Electrical Engineers' wiring rules; the 1917 edition is accepted by the company.
>
> *Note.*—Unsatisfactory installation work is a source of expense and annoyance to all concerned. The company is prepared to carry out installation work on request, at the cost of the consumer. Consumers may, however, employ any wiring contractor, but it is suggested that only firms of good standing, who are on the National Register of Electrical Installation Contractors, should be employed. The tests carried out by the company before connection are solely for the purpose of ascertaining the leakage and compliance or otherwise with the statutory requirements.

The rest of the conditions merely recite the legal position as to services, meters, connection, and disconnection. Your readers will note that we accept the 1917 I.E.E. rules and recommend employing only registered contractors. The latest I.E.E. rules are far too elaborate, and we want to help consumers, rather than frighten them.

W. Fennell.

Northwich, *October 29th*, 1925.

Is the Contracting Business Degenerating?

In agreement with "Contractor's" and "Ghost's" letters published last week concerning examinations for wiremen, &c., may I suggest that until such time as these become compulsory, employers should take into consideration when employing men that there are some who pay substantial fees and devote their spare time to gaining technical knowledge, either through the I.C.S. or other institutes.

It must be admitted that by doing this the men are proving their interest and willingness to learn their trade, else why should they take the trouble and pay the fees when others who don't trouble or care, but simply bluff through, are enjoying their leisure?

Not only in civil life do some trades demand a minimum efficiency, but, in the Services, trade tests are in force, and the result is that the best men go forward and leave the duds behind—not as it is to-day in most cases when the good workman has to carry the bad one with him.

Wireman.

London, *October 26th*, 1925.

I would just like to break in on the discussion of the trials of wiring contractors and the recrudescence of the "Diplomas for Wiremen" idea.

Now, whilst there undoubtedly is such an individual as the "Jerry Wireman," the jerry wiring contractor also exists, and to those engaged in the industry who seek foes to conquer I would say that he is the greater enemy. He is the man who cuts your price with cheap and nasty 1/18, who runs "umpteen" wires in tube where you would have provided an easy draw-in. Some of his under-the-floor jobs seem to say "Oh where, oh where, has that little tube gone?"

In a long experience the writer has found more trouble and breakdowns traceable to the unscrupulous contractor than to the bad workman.

Do not leave him to his own funeral; he is cutting your price all the time. He may be that jerry wireman you sacked last week, he may be a grocer or a candlestick-maker, who cares?—but the house he wires may be burnt out next week.

Then for the good of the industry let us have registered contractors first, and maybe the jerry wireman will go along with the jerry wiring contractor, wherever that may be.

Oh yes, I know that registered contractors do exist, but I am asking for a scheme which shall include every electrical contractor.

The support fire insurance companies, supply authorities and the like, should give such a scheme would make it practically compulsory for a contractor to be registered, and the fear of loss of registration would be an effectual safeguard against the kind of work put in sometimes, by the plumber, the ironmonger, or the local radio stores.

H. Verrall.

London, *October 28th*, 1925.

Mr. E. O. Walker's communication of the 14th inst. draws attention to many anomalies which hinder the progress of electrical installation work on an economical basis as compared with gas. At the same time, while one must agree with him regarding the general absence of accidents with electrical fittings, I would suggest that it would be absolutely fatal to the future of the industry to allow any slackening of the regulations. A lot of "shoddy" wiring jobs are done now, and any attempt to modify the rules in the direction indicated will only tend to increase this kind of work. We want an installation to possess safety and reliability after years of service and this without expensive maintenance and renewal of fittings.

Do not let us be led away by a desire to revise the wiring rules in order to permit of greater laxity in safety measures. Let us turn our attention to a crusade for the more stringent regulation of gas. As Mr. Walker points out, how often does one read of fatal results due to gas leakage from defective pipes. Only a few days ago, a Manchester innkeeper was asphyxiated in his own electrically lighted premises by a leakage from a large gas main running under the pavement outside. According to published accounts, the gas department merely explained that the main was laid several years previously and no tests had since been made to determine its condition. Further, it would appear that there was not any test, short of pulling up the ground, which would indicate the whereabouts or even existence of any leakage. What a confession to make. Are there no regulations governing gas supply? If not, then it would appear time that the standard was raised to that at which we aim in electricity supply.

Touching on the penultimate paragraph of Mr. Walker's letter and also on the remarks of some other correspondents, it is not always the odd job wireman who is in the picture. One has only to glance at published lists of tenders submitted by reputable and registered electrical contractors to discover an amazing difference between the prices. Especially is this noticeable in the case of a large institution contract, where, presumably, there is the same specification to meet and a consulting engineer to satisfy. One can only draw one conclusion—shoddy work which initially just passes the rules.

"Ghost" refers to "popularising electricity." Popular handbooks on "how to do this and that," and cheap correspondence schools, have made many electricians (!) for a few shillings, and the tragedy is that the non-technical public believes it. Electricity is a side line with plumbers, watchmakers, stationery and fancy goods dealers, &c., and people will employ these where on the other hand they would not dream of consulting anybody except a registered medical man, licensed dentist, or a chartered accountant for their other affairs. Why? Because a non-trained individual would be prohibited from practice in the latter professions and the respective associations would see to it. It is up to us to put the electrical engineer on the same footing and then, and only then, shall we get electrical work properly done.

W. T. Critcher,
A.M.I.E.E., Assoc.M.C.T.

Swinton, *October 26th*, 1925.

[This letter has been abbreviated.—Eds. Elec. Rev.]

Waste Heat from Steam-driven Stations.

The chairman's address to the South Midland Centre of the I.E.E. says that no remedy is forthcoming for the waste of heat by steam-driven stations on a large scale.

I have repeatedly suggested that most effective use can be made of it to stimulate crop growth. The warm water can be used in open channel irrigation, or passed through a grid of buried pipes.

The new sugar industry is a good field for trial. Probably two or three crops of sugar beet could be raised per annum, instead of one, which would improve the present low annual load factor of the refinery. The refinery itself is a good customer for waste heat, at the times when the crop is off the ground.

This is an example. Other crops may pay as well or better, specially early market garden stuff, and, with the assistance of glass, grapes, tomatoes and the like.

I believe there is no other general application of low-temperature heat which can give so good a return.

Experiments on a small scale would not be very costly, and should investigate the questions of fertilisers and other matters, arising from working the soil harder.

Henry M. Sayers.

London, *November 1st*, 1925.

Motor Converters v. Rotary Converters.

The subject of motor converters *v.* rotary converters is one that interests me greatly, and as I am in favour of the former venture to reply to Mr. Wüthrich's remarks.

Taking the points in the order that he gives them:—

1. I agree entirely with his first statement that it is an advantage to have a separate transformer; incidentally, most modern power systems work at higher voltages than 11,000 V, so the motor converter would be no different here to the rotary.
2. I have frequently started up rotaries and induction motors (the a.c. side of a motor converter), and of the two I think the induction motor is considerably easier. Most people will, I am sure, agree with me.
3. At full load the rotary is certainly far more efficient, but at about ½ to ¾ load there is but little difference, and this is usually about the working load. I agree that the two forms of converter are equal as regards power factor correction.
4. Mr. Wüthrich admits that the rotary is inherently inferior to the motor converter as regards d.c. regulation, but suggests using an induction regulator. Admitting that the efficiency is still higher—which I doubt—induction regulators for large-sized machines are too big and costly to be of much use, otherwise why aren't they more often used?
5. Here I am in agreement.
6. This Mr. Wüthrich dismisses practically by saying that it is a "small reduction in peripheral speed"! Does he consider 50 per cent. small? The wear and tear on bearings must of necessity be less; while on the d.c. side the motor converter is practically immune from flash-over on sudden overload, a thing far from rare on a traction rotary. In fact traction rotaries of 50 cycles, 1,500 r.p.m., 1,500 V, are, to the best of my belief, not manufactured in this country; and in the States, where they are made, I believe the commutator looks like a ploughed field.
7. This is practically a repetition of No. 2, and if an induction regulator is inserted with the rotary then certainly the motor converter is the easier to handle.

As regards space the rotary "has it every time." To state that the design of a rotary is easier surprises me. Surely there is no difference. The mere fact of passing leads from one part of the machine to the other does not strike me as a complication.

Finally, with regard to manufacture, I believe I am right in saying that until recently only one firm in this country held the patent rights of manufacture. These expired lately, and as soon as they did so at least one other well-known firm started to manufacture La Cour motor converters.

H. A. Sieveking (B.Sc.).

Rugby, *October 30th*, 1925.

Mr. Wüthrich, in his letter appearing in the current issue of your paper, once again raises this time-honoured controversy, and makes comparisons which would appear to suggest that the firm with which he is connected does not build motor converters, and that he is perturbed by the steadily increasing demand for these machines.

The various arguments which he puts forward have been fully answered in previous discussions, and he has evidently overlooked the fact that it was only after the British master patent expired a few years ago that motor converters could be manufactured in Great Britain by other than one company; and the additional firms who are now building these machines are just those who have had the most extensive and successful experience in the manufacture of rotary converters.

I would like to point out two errors in Mr. Wüthrich's letter:—

(*a*) He states that the full load efficiency of a 1,000-kW motor converter is about 89.5 per cent., whereas the efficiency of such a machine is actually 93 per cent., which is the same figure as he claims for a rotary converter of this size with series reactance.

(*b*) He says: "The leads connecting the two rotor windings have to be led through the hollow shaft and middle bearing, this being a rather weak point, from a constructional point of view."

This is perfectly true with the old 3-bearing machine, but motor converters of modern design are built with only two bearings, and consequently his criticism does not apply.

The motor converter has steadily increased in favour since it was first introduced into this country, and its present popularity is neither a fad nor a fashion, as Mr. Wüthrich suggests, but is due to its proved merits.

As the firm with which I am associated equally manufactures motor converters and rotary converters, I am perhaps in a position to take a more disinterested view than is possible with your correspondent.

John H. Bunting.

London, *October 31st*, 1925.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

Our Telephone Number.—The telephone number of the ELECTRICAL REVIEW (all departments) has been changed to "Central 7072" (three lines).

E.C.A. Conference, 1926.—It is announced in the *Electrical Contractor* (the official organ of the E.C.A.), that the first annual conference of the E.C.A. Allied Organisations will be held in Brighton during the summer of 1926. The proposal was unanimously adopted by the Council at its meeting on October 21st. The matter came forward in the form of a resolution from the Western Section that an annual summer Convention or Conference extending over two days should be held. The various branches and members are to be notified at the earliest possible moment.

Difficulties of German Electrical Companies.—In its report for the year 1924-25, the Isaria Meter Works G., of Munich, stated that trade activity was generally favourable, and in some departments overtime had to be worked, but the net profits of 31,000 marks did not permit of the distribution of a dividend, the reason for this being that selling prices, particularly for meters, were too low. Since the beginning of the new financial year, however, prices have advanced, and are gradually approaching the level of the former peace-time rates. The report of Brown, Boveri & Co., of Mannheim, for 1924, states that orders received showed a considerable falling off in the second half of the year. They were in many cases only obtained at prices which yielded no profits and often resulted in a loss. Since the beginning of the year, wages increased by 60 per cent. Differences of a few per cent. in the costs of production were a determining factor in the matter of the competitive capacity of the industry in the home and foreign markets. The burden of taxation prevented the operation of the undertakings on a basis which promised a regulated and moderate return, and it hindered competitive capability in the world's markets. The liquidation of transactions dating from the period of the inflation continued to burden the year's working, and would only be completed in 1925. Notwithstanding all these difficulties, the departments made satisfactory progress; it had been found possible systematically to simplify and further improve production. The accounts for 1924 show a loss of 141,000 marks. At the recent annual meeting it was stated that orders during 1925 have been satisfactory, and will provide employment for some time, although selling prices still leave something to be desired.

Depression in the Rhine Provinces.—The *Times Trade and Engineering Supplement* states that industrial conditions in the Rhine Provinces are weekly becoming more serious. In the iron and steel industries employés are being thrown out of work by the closing down of factories. One electrical works has closed down and dismissed all its employés.

A Trade Forecast.—In the forecast of the Federation of British Industries, published in its organ, *British Industry*, it is stated:—"There are fairly definite signs that the lull in world trade which, in accordance with our previous forecast, prevailed throughout the last quarter, is coming to an end, and that a new period of expanding trade is about to begin. This movement, which is primarily seasonal in character, received considerable encouragement from the change over to a policy of cheap money and plentiful credit which occurred in August, followed by a subsequent further reduction of the Bank Rate on October 1st. If some official assurance could be obtained that the present monetary policy is to be persisted in, this movement might easily reach substantial dimensions, especially if the inflationary tendencies already at work in America remain unchecked. Unfortunately, the recent weakness in our exchange, coupled with the heavy outflow of gold, amounting to nearly £7,000,000 during the first three weeks of this month, introduces the possibility of a reversion to a higher Bank Rate during the next few weeks; but such a change would imply miscalculation. Much will also depend on the policy pursued by the New York Federal Reserve Board. There are, however, as yet no signs of the removal of the embargo on foreign investment; and our labour costs are not yet adjusted to our exchange."

Support for the E.D.A.—The Electricity Committee of Exeter City Council has resolved to contribute ten guineas per annum to the British Electrical Development Association.

Local Exhibitions. — Glasgow. — A radio exhibition organised by Consulting and Radio Service, Ltd., was opened at 15, Gordon Street, on October 31st, by Sir R. Wilson. The exhibitors include the Western Electric Co., Ltd., the General Electric Co., Ltd., Burndept Wireless, Ltd., the Marconiphone Co., Ltd., the British Thomson-Houston Co., Ltd., the British Radio Corporation, Metro-Vick Supplies, Ltd., the Radio Communication Co., Ltd., Messrs. Cahill & Co., Ltd., and Messrs. S. G. Brown, Ltd.

Elland.—An exhibition of electrical appliances, principally domestic, was opened on October 26th, by Mr. W. B. Woodhouse, general manager of the Yorkshire Electric Power Co. The Elland electricity undertaking was established in 1903, but in 1921 local generation was stopped and supply has since been obtained in bulk from the Yorkshire Electric Power Co.

Burnley.—We are informed by the borough electrical engineer (Mr. J. E. Starkie) that the Electricity Committee is planning an exhibition on a large scale to be held about the end of January next.

A "Siemens" Sign.—A striking illuminated neon sign of approximately 1,000 candle power, measuring 10 ft. by 2½ ft., representing the trade mark "Siemens," has recently been fixed above the facia of the Siemens & English Electric Lamp Co., Ltd.'s premises at 38-39, Upper Thames Street, E.C.4.

A Siemens Neon-Tube Sign.

The light given is very distinctive and peculiarly attractive. When illuminated the sign is quite a landmark and can easily be seen from the Blackfriars end of Upper Thames Street on the one hand and from Cannon Street Station on the other. We reproduce herewith a photograph of the sign.

Trade Announcements.—The Marconiphone Co., Ltd., whose head office is now 210-212, Tottenham Court Road, London, W.1, has lately opened a number of new branches in various parts of the country, to facilitate distribution of its products. In addition to the branches stated in the company's recent advertisements it has opened others at Southampton (81a, Above Bar); at Leeds (15, Wellington Street); and at Liverpool (1, Oriel Close, Water Street).

Messrs. Austin Walters & Son, Ltd., have appointed Messrs. S. G. Leach & Co., Ltd., 26-30, Artillery Lane, E.C., as their sole agents for London and the South of England, and export.

Mr. J. C. White, of Manchester, has installed an additional telephone line; the numbers now are: Central 1090 and 1091.

The Mullard Wireless Service Co., Ltd., has opened a depôt at 30, Handyside Arcade, Percy Street, Newcastle-on-Tyne, under the management of Mr. F. F. Turner. Stocks are carried.

Mr. Charles Clout, electrical and radio engineer, 134-5, Snargate Street, and Worthington Street, Dover, has opened new premises at 1 and 2, Priory Place, in that town.

The County Electrical & Wireless Stores, Ltd., of 2-3, Norfolk Street, Strand, London, has removed its business at Folkestone to larger premises at 124, Sandgate Road.

The Foster Engineering Co., Ltd., has opened an additional office and stores for the trade at 37, South Castle Street, Liverpool, for the sale of "Apex" ironclad switchgear, "Foster" transformers, "Crown" cable and wires, &c., and electrical accessories. Mr. G. S. Williams has been appointed manager of the branch.

The English Electric Co., Ltd., announces that instead of treating the Manchester, Bradford, Sheffield and Liverpool districts as four distinct sales areas, each controlled by a separate branch office, it is combining them so as to form a "Northern Area" with headquarters at 196, Deansgate, Manchester, under the direction of Mr. P. H. Symonds, M.I.Mech.E., A.M.I.E.E., who has been appointed Northern area sales manager for the company. The existing offices at Bradford, Sheffield and Liverpool, will be maintained as subsidiary offices and will continue to deal with the company's business in their respective districts.

Messrs. Clarke & Pitcher, electricians, have opened new premises at 10a, Dover Road, Folkestone.

Catalogues and Lists.—The Sterling Varnish Co., 196, Deansgate, Manchester.—A pamphlet advertising the firm's insulating varnishes.

Simplex Conduits, Ltd., Garrison Lane, Birmingham.—A comprehensive catalogue (96 pp.) of "Simplex" conduits and conduit fittings. Fully illustrated and priced.

Metro-Vick Supplies, Ltd., Trafford Park, Manchester.—An illustrated booklet entitled "The Hospitality of Light," presenting the case for electric lighting generally—and by "Cosmos" lamps in particular.

The Marconiphone Co., Ltd., 210-212, Tottenham Court Road, W.1.—Three well-illustrated and priced catalogues dealing respectively with "Marconiphone" and "Sterling" radio apparatus, and "Marconi" valves.

Messrs. Herbert Morris, Ltd., Loughborough.—Book 105, containing particulars of the Morris gravity conveyor, &c.

The Midland Accumulator Co., 47, Newhall Hill Parade, Birmingham.—A priced pamphlet giving details of the firm's accumulators for radio work.

Tok Switches, Ltd., Granville House, Arundel Street, W.C.2.—November blotter illustrating rotary snap switches.

The British Thomson-Houston Co., Ltd., Crown House, Aldwych, W.C.2.—Pamphlet L356, describing "Mazda" electric decoration lamp outfits for shop windows, Christmas trees, &c.

Delco-Remy & Hyatt, Ltd., 111, Grosvenor Road, S.W.1.—A series of slips containing information relating to the company's bearings, mine-tub wheels, belting, thermostats, and starting, lighting and ignition apparatus.

Messrs. Austin Walters & Son, Ltd., Little Peter Street, Manchester.—An illustrated and priced catalogue of electric signs, containing views of actual installations.

The Jackson Electric Stove Co., Ltd., 143, Sloane Street, S.W.1.—A calendar-blotter for November, illustrating one of the firm's fires.

Electricity Services, Ltd., 27, Martin Lane, Cannon Street, E.C.4.—A pamphlet dealing with good illumination and advertising the firm's installation-maintenance service.

Messrs. John Bennie, Ltd., Moncur Street, Glasgow.—A leaflet illustrating examples of the company's electric and other lifts.

Messrs. Garnett, Whiteley & Co., Ltd., "Lotus Works," Broadgreen Road, Liverpool.—A coloured showcard advertising "Lotus" vernier coil holders. Priced.

Messrs. Alfred Herbert, Ltd., Coventry.—A pamphlet dealing with pulverised fuel for boiler firing in the paper industry.

The Igranic Electric Co., Ltd., 149, Queen Victoria Street, E.C.4.—A booklet giving details and prices of "Igranic" radio accessories generally, and a series of leaflets dealing with particular components.

Bankruptcy Proceedings.—W. R. J. White, electrical agent, 29, Great Pulteney Street, W.—This bankrupt applied, on October 27th, to Mr. Registrar Mellor at the London Bankruptcy Court for an order of discharge. The Official Receiver reported that the bankrupt failed in September, 1922, with liabilities of £1,151; the assets realised £131, and a first and final dividend of 1s. 5½d. in the £ was paid. The bankrupt commenced business in October, 1920, and carried it on with various partners. He attributed his failure to depreciation in the value of his investments. The application was opposed on the ground of rash and hazardous speculations and unjustifiable extravagance in living. A discharge was granted, subject to a judgment for £50 to be satisfied by an immediate cash payment.

S. S. Schreiber, dealer in electric lamps and accessories, 175, Great Portland Street, W.—This debtor was made bankrupt in May last on the petition of the British Thomson-Houston Co., Ltd., his only liability being £131 in respect of costs of an injunction restraining him from infringing the company's patents. He applied on October 27th to Mr. Registrar Mellor, at the London Bankruptcy Court, for an order of discharge, when the Official Receiver reported insufficiency of assets to equal 10s. in the £ on the amount of the liabilities, and omission to keep proper books of account. After hearing Mr. A. W. Horsell, in support of the application, his Honour granted a discharge subject to judgment for £20 to be satisfied by an immediate cash payment.

W. R. Ball and H. J. Leech, trading as R. Ball & Company, electrical engineers, 287, Upper Street, Islington.—The public examination of these debtors was held recently. The accounts showed liabilities of £2,328 (unsecured £2,230), and assets "cash in hands of Sheriff," £20 17s. Replying to Mr. F. Vyvyan, Official Receiver, the debtor Ball stated that in January, 1922, with £100 capital, he commenced business at the above address as an electrical and mechanical engineer; the debtor Leech joined him as a partner fourteen months later, introducing £200 in cash and machinery in return for a half share of the profits. They subsequently traded as R. Ball & Company, until last March, when their stock, machinery, and furniture, were sold under an execution. In September, 1924, they entered into a contract to supply 15,000 pairs of headphones at the rate of 500 pairs per week. Owing to the late delivery by the manufacturers of certain materials required for the contract, delivery was not made to time, and, in consequence, the contract was cancelled, and in February,

1925, they were sued for breach of contract and judgment was given against them for £369, of which £70 had been paid. The examination was concluded.

H. McCLELLAND, 12, Leigham Avenue, Streatham Hill, S.W., late 48, Strand, London, radio apparatus merchant.—The first meeting of creditors was held on October 30th, at 29, Russell Square, W.C.1. The statement of affairs showed liabilities of £1,862 and there were no assets. Debtor attributed his failure to lack of capital and bad trade in a partnership business. After being in partnership with another from September, 1919, to July, 1923, his partner retired without receiving any payment, and debtor took over the assets and liabilities. He traded on his own account until August, 1924, when he sold the lease of the premises and a portion of the stock for £250, and out of this sum discharged the greater part of his liabilities. In September, 1924, he entered into verbal partnership with another and they traded as radio apparatus merchants at 48, Strand, W.C., under the style of the X.L.O. Company. He brought the remainder of the stock (about £150) from his previous business to the business. In May, 1925, the second partnership was dissolved, his partner taking over the assets and liabilities without payment to the debtor. Debtor became aware of his position in October, 1924. The case being a summary one, was left with the Official Receiver as trustee of the estate. The following are creditors:—

	£		£
Battersby, Mrs. T.	160	McClelland, J.	... 1,220
Marconiphone Co., Ltd. ...	110	McClelland, W.	... 200
Renold, M.	80	Reid, H.	... 90

W. R. SQUIRE, 11, Steward Street, Spring Hill, Birmingham, electrical engineer.—The first meeting of creditors was held on October 29th at the Official Receiver's offices, Birmingham. The statement of affairs showed ranking liabilities of £68, and a deficiency of £41. Debtor attributed his failure to depreciation in value of stock, bad debts, and trade depression. He commenced business as an electrical engineer at Redditch in 1907, but this was discontinued. In April, 1919, he recommenced business as an electrical engineer at Edgbaston with £140 capital, and in March, 1921, he removed to his present address. The matter was left with the Official Receiver as trustee of the estate.

W. J. LATTIMER, trading as W. J. Lattimer & Co., 52, High Street, Croydon, electrical engineer.—The receiving order in this matter was made recently on a creditor's petition. The statement of affairs shows liabilities of £285 against assets of £11, leaving a deficiency of £274. Debtor attributes his failure to lack of capital and underestimating the cost of contracts carried out. In 1919 debtor commenced business without capital as an electrical contractor, with a shop, where he sold electrical fittings. The shop, however, did not prove profitable and he closed it down in March, 1922, and continued only the contracting business. He became aware of his position in February, 1925, since when most of the present debts have been contracted. The following are creditors:—

	£		£
Emanuel & Sons, Ltd.	25	Electrical Supplies, Ltd.	50
Cysiles, Ltd.	20	Falk, Stadelmann & Co., Ltd.	55
Thomas & Co.	20		

J. MITCHELL and F. MITCHELL (F. Mitchell & Co.), electrical engineers, 97, Stockport Road, Ardwick, and 58, Ashton Old Road, Openshaw, Manchester.—Last day for proofs for dividend, November 14th. Trustee, Mr. J. G. Gibson, Official Receiver, Byrom Street, Manchester.

F. MITCHELL, lately carrying on business with J. Mitchell (F. Mitchell & Co.), electrical engineer, 113, Broom Lane, Levenshulme, Manchester.—First and final dividend of 5s. 0¾d. in the £, payable November 9th, at the Official Receiver's offices, Byrom Street, Manchester.

W. K. COXON (Western Manufacturing Co.), wireless apparatus manufacturers, Nurshell, Lydney, Glos.—Receiving order made October 21st, on creditor's petition. First meeting, November 4th, at 34, Park Lane, Cardiff; public examination, December 15th, at the Town Hall, Newport, Mon.

S. PURCELL, electrical contractor, The Arcade, Goole, Yorks.—First meeting, November 3rd, at the Official Receiver's office, 1, King Street, Wakefield; public examination, November 12th, at the Court House, Wakefield.

Company Liquidations.—ISAACSON & BROWN, LTD., electrical engineers, 39, Furnival Street, Holborn, E.C.4.—A meeting of creditors was held on October 24th at 14, Chancery Lane, W.C., when Mr. R. Chudleigh, the liquidator of the company, presented a statement of affairs, which disclosed liabilities of £1,644 and debentures and interest amounting to £562. The assets totalled £11, leaving a deficiency of £2,195. The deficiency account showed that there were trading losses to June 8th, 1923, of £2,053, and for the period from June 8th, 1923, to October 4th last there was a loss of £334. The company was formed in June, 1923, with a nominal capital of £1,000, which, in November, 1919, was increased to £5,000. Debentures were issued in January, 1913, amounting to £800, and on June 8th, 1923, when a receiver was appointed, there was a balance of £775 outstanding. It was stated that in 1916, 1917, and 1918 profits were made, but since then losses had been incurred. The liquidator said that all goods obtained since the appointment of the receiver had been paid for in cash. It was decided that the voluntary liquidation of the company should be continued with the present liquidator.

J. SPRINGER, LTD., 152, Wardour Street, W., and High Wycombe, electrical engineers and kinema furnishers.—A further meeting of creditors was held recently. The meeting was called by Mr. C. B. Holland, C.A., of Messrs. Prideaux, Old Square, Lincolns Inn, W.C., who had been appointed as the liquidator in the voluntary liquidation of the company, for the purpose of considering an offer of approximately 1s. in the £. The creditors passed a resolution agreeing to accept a composition of not less than 2s. in the £.

ELECTRIC LOCOMOTION & FOUNDRY CO., LTD.—A meeting of members is called for December 1st at E. Milburn House, Newcastle-upon-Tyne, to hear an account of the winding up from the liquidator, Mr. T. C. Martin.

ELECTRIC DISTRIBUTING CO., LTD.—Particulars of claims are to be sent to the liquidator, Mr. H. S. Jones, 3, York Street, Manchester, by November 16th.

CONSOLIDATED DIESEL ENGINE MANUFACTURERS, LTD.—Liquidator, Sir W. B. Peat, 11, Ironmonger Lane, released October 26th.

ELECTRIC REPAIRS, LTD.—Meeting of creditors, November 11th, at Imperial Buildings, Bridge Street, Walsall; particulars of claims to the liquidator, Mr. J. T. Bunch, Imperial Buildings, by December 18th.

Dissolutions of Partnership.—BROWN & MASON, electricians, Barn Street, Strathaven, Lanarkshire.—Messrs. W. Brown and H. Mason have dissolved partnership. Mr. Brown will carry on the business at Barn Street, and Mr. Mason at Sun Buildings, Kirk Street.

WARDELL & Co., electrical contractors, 83, Raleigh Road, Richmond, Surrey.—Mr. F. W. Wardell and Mr. J. W. Poultney have dissolved partnership. Debts will be attended to by Mr. Wardell, who will continue the business.

Book Notices.—"Year Book and Diary" (88 pp. and diary pages). Edinburgh: The Electrical Contractors' Association of Scotland. Price 3s.—This contains lists of members and officers of the Central Board and branches, with notes of the Association's activities. In addition there is a great deal of information of service to contractors; including regulations, model tender conditions, legal notes, and organisation details.

"Scientific Paradoxes and Problems." By A. S. E. Ackermann, B.Sc., A.M.Inst.C.E. Pp. viii + 131. London: Old Westminster Press. Price 5s. net.—The author of "Popular Fallacies," having broadcast a series of "talks from 2LO" on that subject, was bombarded with knotty problems and paradoxes, 100 of which are dealt with in this volume. Many of them are strictly genuine physical or dynamical problems, requiring a wide range of scientific information for their solution; others are puzzling only to the layman unfamiliar with elementary mechanics or mathematics, and others, again, are of the "trick" variety, or purely plays upon words and figures—but all are interesting, and it is not easy to put the book down once it is opened. Certainly its publication was well worth while.

"The *Ironmonger* Pocket Book." (64 pp.) London: The *Ironmonger*. Price 1s.—This is a real pocket book, *i.e.*, it is of a convenient size for a pocket, and contains a large number of tables of data relating to tinplates, bolts and nuts, copper, lead, cast-iron, boilers, tanks, belting, and numerous other matters. It also contains a squared-paper notebook.

"Mechanical Testing of Materials." By W. M. Crossman. Pp. 36; 11 figs. London: Association of Engineering and Shipbuilding Draughtsmen. Price 2s.—The author of this pamphlet recognised that a full treatment of the subject was impossible; his aim was to briefly outline the several methods employed in scientific and commercial testing, with the object of creating practical interest in this section of engineering rather than entering into the mathematical aspect of the subject.

"Power Alcohol from Beet." Pp. 16. London: British Power Alcohol Association.

The McGraw-Hill Publishing Co., Ltd., has issued a list of American books on business and economics. Details of the scope of these works and their prices are given.

"The *Journal* of the South African Institution of Engineers." Vol. XXIV, No. 3. October, 1925. Price 2s.

"Scientific Papers of the Institute of Physical and Chemical Research, Tokio, Japan." Vol. 3, No. 37, July, 1925; Nos. 38-40, August, 1925.

"Coils and Magnet Wire." By C. R. Underhill. Pp. xi+494; figs. 197. London: McGraw-Hill Publishing Co., Ltd. Price 20s.

"The Mathematical Theory of Electricity and Magnetism." By J. H. Jeans. Pp. viii+652; figs. 139. Cambridge University Press. Price 21s. net.

"Behind the Counter." A practical guide for shop assistants. By W. H. Beable. Pp. 102. London: Simpkin, Marshall, Hamilton, Kent & Co., Ltd. Price 3s. 6d. net.

"Anniversary Volume of Voluntary Contributions," dedicated to Prof. Hantaro Nagaoka, on the completion of 25 years' professorship at the Tokio Imperial University. Tokio, 1925.

Electrical Goods for Brazil.—A slight improvement is recorded in exports of British electrical goods to Brazil. A recent monthly consignment from the United Kingdom consisted of 10 metric tons (164 cases of mixed goods), compared with 36 metric tons (2,064 cases) from the United States, and 27 metric tons (227 cases) from Germany.—*Reuter's Trade Service* (Rio de Janeiro).

New Belgian Companies.—Among the recently-formed Belgian companies are the following:—Les Etablissements Edouard George et Cie. (Brussels, capital 250,000 fr.), for the manufacture and sale of heating, electrical, telephone, and radio apparatus, &c. Constructions Electriques Marelli (Brussels, capital 800,000 fr.), for the sale and, later, manufacture in Belgium of electrical machinery. Electricité de la Lesse (Anseremme-lez-Dinant, capital 300,000 fr.), for the supply of electricity for all public and private purposes. Ateliers E.-R. Lataire Frères (Eecloo, capital 1½ million fr.), for the production, *inter alia*, of electric motors and speed-reduction apparatus. La Cuivrerie Liégeoise (Liége, capital 225,000 fr.), for the manufacture and sale of lighting glassware and electro-technical apparatus.

Lead.—Messrs. James Forster & Co. on October 31st stated:—"Supplies are coming in steadily, and there is no shortage of prompt lead. A scarcity is now predicted for next month, but, as this was said of October, we do not attach much importance to it. With the shipping strike collapsing in Australia, the prospect is for full supplies and, if consumers continue to hold off the market, this can only result in lower prices."

The New Southport Showrooms.—In our last issue we reported that the new municipal electricity showrooms and offices at Southport were recently opened. We have now received a number of photographs of the new premises from the borough electrical engineer (Mr. E. Moxon); three of these views are reproduced herewith. The first shows the exterior of the building, which is situated in a far better position than the Department's old offices. The premises were formerly a skating rink. Fig. 2 is a view of one of the principal rooms, and shows a number of electrical appliances, including an ironer, several types of fires, a vacuum cleaner, and an electrically-driven sewing machine, as well as various kinds of lighting fittings. The third illustration is of the demonstration room. This is equipped with tip-up seats and a *dais*, on which are mounted cookers and other kitchen requisites, which can be shown in action to prospective users.

Fig. 1.—Exterior.

Fig. 2.—One of the Main Rooms.

Fig. 3.—The Demonstration Room.

The New Southport Showrooms.

The New North Wales Company.—With reference to the new company named "Electricity Distribution of North Wales and District, Ltd.," the registration of which was announced in some detail on page 706 of our last issue, we understand that this company will operate under statutory powers and distribute in detail electric supplies in a number of towns in North Wales, including Denbigh, St. Asaph, Flint, Holywell, Rhuddlan, Sandbach, Alsager, Pwllheli, Wrexham Rural District, Abergele, Criccieth, Nantwich, and the surrounding districts representing an area with a population of some 300,000. Supplies of electricity will be derived in bulk from the North Wales Power Co., which owns hydro-electric stations in the Snowdon and Carnedd Llewellyn districts of North Wales, and whose system of transmission lines already substantially extends from Carnarvon Bay to Crewe. The expenditure on the initial programme is estimated at some £200,000, all of which has already been provided for. The directors include Messrs. H. J. Jack, A. F. Bott, R. F. Legge, and G. V. Twiss. Mr. E. C. Heymer is the secretary, and the registered offices are at Wellington House, Buckingham Gate, S.W.1. The Power Development Co., Ltd., of 25, Victoria Street, which has been concerned in the formation of the company, is acting as engineers. Mr. G. V. Twiss, who has founded the Power Development Co., Ltd., has merged with it the organisation of the consulting business of G. V. Twiss & Co., and has moved to offices at 25, Victoria Street, S.W.1. (Telephone Nos.: "Victoria 4544 and 4545.")

A Large Floating Crane.—The *Morning Post* reports that the Port of London Authority has decided to place a contract with Messrs. Cowans, Sheldon & Co., Ltd., Carlisle, for the construction of a floating crane capable of lifting weights up to 150 tons. The largest of the Authority's existing cranes is only intended for a maximum load of 50 tons. The crane will be self-propelling, the driving engines being steam-driven, while the actual crane power will be electrical.

Strike at Wire Works.—Last week over 200 wire drawers employed by Messrs. Richard Johnson & Nephew ceased work owing to differences as to the distribution of work among the hands.

Large British Contracts.—Among the important contracts recently awarded to British firms the following may be mentioned:—The English Electric Co., Ltd.: Forty large railway motors for the Southern Railway, and five electric locomotives for the Montreal Harbour Board. Westinghouse Brake and Saxby Signal Co., Ltd.: Power signalling apparatus for Charing Cross and Cannon Street stations (Southern Railway). Henry Simon, Ltd.: An electrically-operated pneumatic coal-handling equipment (25 tons per hour), for a London brewing firm.

British and Continental Cable Prices.—A discussion arose at a meeting of the Accrington Town Council recently, when it was reported that the Continental quotation for 1,000 yards of main cable was nearly one-third less than the British on a contract of £600, while the cable was guaranteed to be as good as the British. Alderman Higham, chairman of the Electricity Committee, said it had been suggested to ask the members of the Cable Makers' Association to accept a lower figure. Personally he would like to keep the order in this country, because he believed in finding employment for our workpeople, but his fiscal doctrine led him to favour the purchase in the cheapest market. He would like the opinion of the Council. It was not a matter of one small contract, for this year Accrington had spent over £10,000 on cables, and they wanted to settle the policy once and for all. In the course of the discussion one speaker said that how the Continental goods were produced as compared with the British was an important consideration and Mr. Higham said they would try to obtain information as to hours and wages for the Continental product. A later speaker remarked that the question affected all municipalities, and he suggested that Corporations should amalgamate and try to secure a re-adjustment of prices. Councillor Slack thought it better to leave the matter with the Committee for the present. Mr. Roberts said it would be too late to protest after the order had been given. As a trade unionist, he would object to any order, however cheap, if trade union conditions were not observed. Other speakers wanted the order to remain here to prevent our men being thrown on the streets, but wanted to stamp out consultation between firms before tendering. Alderman Barlow said the Council must not overlook the question of quality. The British cable test was a very efficient one, and little trouble was experienced with the cables. They had no information as to the testing systems of the Continental product. No resolution was passed, the matter being left to the Committee for the time being.

For Sale.—Worcester Corporation electricity department has for disposal two Weir direct-acting feed pumps. Swansea Corporation electricity department invites offers for surplus generating plant, including motor generators, motors, meters, gas engines, &c. Messrs. H. Butcher & Co. will sell by auction on November 19th and following day, at 13, High Holborn, W.C., surplus electrical stores and accessories, &c. (See our advertisement pages to-day.)

Social Events.—The seventh annual dinner of those engaged in the Wakefield Electricity Department was held at the Great Bull Restaurant on October 30th. Mr. H. G. Frazer, city electrical engineer, presided, and he was supported by the Mayor-Elect (Alderman C. Mellor, J.P.), Alderman W. Emmett (chairman of the Electricity Committee), Councillor J. D. Jackson, J.P. (deputy-chairman), and other members of the Committee. The toast of "The Undertaking" was proposed by Alderman Emmett and responded to by Mr. Frazer. There was an interesting musical programme.

The employés at the head office and works of Messrs. William White & Co., together with their friends, spent a social evening last Saturday at the "Horns," Kennington. Mr. H. Foster presided. After dinner the evening was devoted to music and dancing.

Ex-British Westinghouse Association. — Mr. L. S. Richardson, the secretary of the Association, has sent us an up-to-date list of members and "bad lads." We have also received a copy of "Inter Nos," the Association's occasional journal, which is full of bright reminders regarding the payment of subscriptions, and also contains some notes on the last annual dinner. The next annual dinner is to be held on March 5th at the Holborn Restaurant.

The Dutch Electrical Market.—The position of the electrical market in the Netherlands was recently reviewed by *Commerce Reports*. According to our contemporary electricity is employed to only a very limited extent in Dutch homes owing to the high charges for electricity which prevail generally as well as to the conversatism which exists. Where domestic electrical appliances are used, however, they are mainly of German origin, although Great Britain and Switzerland supply articles of a better class. Vacuum cleaners are an exception to the general rule in that they are widely employed; most of these are of American manufacture. There is no scope for washing machines as usually laundry work is not done at home. Fans, too, are not much used owing to the equable temperature, and for the same reason there is little demand for refrigerators. In most cases the retailer buys electrical appliances from an agent or importer, but some large retailers import direct from the manufacturer.

A Report upon Angola.—Mr. A. B. Hutcheon, the British Consul-General at Loanda, has forwarded a report upon Angola (Portuguese West Africa) to the Department of Overseas Trade (Stationery Office, 1s. 6d. net). It is stated that as the country develops its purchasing power will increase and it will afford greater possibilities for trade. Business, on the whole, is said to be very risky at present. Mention is made of a concession granted to a Portuguese group for the harnessing of the Mabubas Falls on the Dande River. Owing to a dispute with the Government regarding the price to be charged for energy the work has not yet been commenced. The Government has undertaken a survey of the country's water-power resources. Concessions have been granted in respect of copper, manganese, and mica deposits, but it appears that little has been done as yet.

Trade with Colombia.—In the course of a report upon Colombia which he has forwarded to the Department of Overseas Trade (Stationery Office, 2s. net), Mr. W. J. Sullivan, British Vice-Consul at Bogotá, says that, without unduly magnifying the importance of Colombia as a market, it may fairly be urged that more could be done to develop British enterprise in various lines. Experience has shown that the practice of having energetic travelling agents in the country has yielded satisfactory results. Credit facilities on terms no less generous than those offered by competitors should be granted, and all catalogues and correspondence should be in Spanish. In the supply of electrical goods the United States predominates at present. Opportunities, nevertheless, occur from which British manufacturers might derive some profit. The installation of new telephone or lighting systems in the smaller towns of the Republic is cited by way of illustration. Colombia possesses large, though at times uncertain, reserves of water power, and their adaptation to the generating of electricity may be expected to increase, if slowly, during the coming years. The Government intends to renovate the telegraph system when funds become available, and developments in the telephone service are also under consideration. The Government has recently purchased radio-telegraph and telephone installations and proposes to extend the use of these services.

A Travelling British Empire Exhibition.—For the benefit of those in provincial centres who were unable to visit Wembley, the Self-Supporting Empire League, under the chairmanship of Admiral Mark Kerr, C.B., M.V.O., has organised a representative British Empire Exhibition which is to make a tour of the chief towns of England and Scotland shortly. The towns scheduled are Southampton, Bournemouth, Exeter, Plymouth, Bristol, Cheltenham, Cardiff, Birmingham, Stoke, Chester, Liverpool, Bradford, Glasgow, Edinburgh, Newcastle, Stockton-on-Tees, York, Leeds, Manchester, Sheffield, Nottingham, Coventry, Leicester, Northampton, Norwich, and Ipswich. The largest hall in each place will be taken for a period ranging from six to 21 days, and the whole tour will occupy about a year. Further details can be obtained from the Secretary of the League at Polebrook House, Golden Square, W.1.

Austrian Lighting Development.—The Austrian Lighting Technics Association has recently organised in the works of the Norma Instrument Co., in Vienna, an exhibition devoted to the technical side of lighting with the object of developing and encouraging the use of modern lighting equipment in the country.

New French Companies.—La Société Union Electrique du Finistère is the name of a new undertaking which has recently been formed at Landerneau, with a capital of 700,000 fr., to establish a plant to supply electricity in the Department of Finistère.

A new company has lately been formed in Paris (9, Rue de Rocroy), with a capital of 125,000 fr. and the title La Société des Applications Radiophoniques, to manufacture radio apparatus.

A new company has just been formed at Clichy, Paris (31, Rue de Madame Sanzillon), with a capital of 2½ million fr. and the title La Société des Etablissements Leclanché, to acquire and carry on works for the manufacture of Leclanché batteries.

The British Empire Exhibition.—The Exhibition came to an end on Saturday last, when it was officially closed by the Duke of York. At a meeting of the Exhibition Association on October 26th, under the chairmanship of Mr. J. H. Thomas, M.P., it was unanimously decided that the company should be wound up voluntarily, and a meeting to confirm this decision is to be held on Tuesday next.

The Sydney correspondent of *The Times* says that action is being taken in Australia by leading citizens who were prominently connected with the British Empire Exhibition to support the suggestion of a permanent British Industries Fair. Representations have been made to Senator Wilson, chairman of the Australian Commission, to convene an early meeting of his colleagues with a view to communicating with the British Government. There is a considerable body of feeling in the Commonwealth that unless the Wembley display is used as the starting-point of a constant advertising campaign, its cost will ultimately be regarded as almost wasted.

The Australian Tariff Board.—Following upon the presentation to the Federal Parliament recently of the annual report of the Tariff Board, reports by that body on specific applications for revised duties have been published. The board was of opinion that the electrical engineering industry was in need of further protection because of the marked difference in wages paid in the United Kingdom, and the difference in cost of raw materials in the two countries. The board recommended that duties be increased in order to endeavour to equalise the cost of goods produced abroad with the cost of production of similar goods in Australia. The Board considered requests for duties of 50 per cent. and upwards on certain types of machines and appliances of British origin, with corresponding increases that would be necessary under the general tariff to preserve British preference; but, having regard to the burdensome effect that such imposts would have on other industries, was of opinion that those requests should not be granted.

Chinese Notes.—The residents of Chapoo, near Shanghai, have raised $20,000 for the construction of an electric lighting plant.

A new power station has been built by the Suiyan Electric Light Co. to replace its obsolete and inadequate plant.

The Soochow telephone system is being extended to Hukwangchen and Motoh, two neighbouring market towns.

The Min Hsin Electric Light Co., Shihpu, Chekiang province, has been registered at the Ministries of Agriculture and Commerce, as have also the Wei Yu Electric Light Plant, Yutsehsien, Shansi province, and the Han Ming Electric Light Co., Chutangchen, Taihsien, Kiangsu province.

The board of the Peking Tramway Co., Ltd., proposes to construct a line round the city and is to undertake the south-western section in the first place.

The Changsu Electric Light Co. (Kiangsu Province) has recently increased its capital from $36,000 to $40,000 for the purpose of purchasing new plant.

The Chang Ming Electric Light Co. is being formed with a capital of $20,000 to supply electricity to Changlientang, Kiangsu Province.

The police authorities in Shansi Province have placed a levy on electric signs.

The Shanghai-Paoshan Tramways Co., organised to install and operate a system of tramways between Shanghai and Paoshan, is shortly commencing the construction work. The company has a paid-up capital of $300,000 and a nominal capital of $1,500,000.

The Japanese Electrical Industry.—A special meeting of the Japanese Electrical Association was held in September to consider methods of improving the organisation, &c., of the electrical machinery and apparatus industry. A number of matters were recommended to the attention of manufacturers, including the formation of combines to produce on a large scale, standardisation, the training of suitable men as engineers, the combating of price cutting, the organisation of the export trade, the prevention of the production of inferior goods, &c.

New Italian Companies.—Among the new concerns recently formed in connection with the electrical engineering and supply industries in Italy, are the Società Costruzioni Elettricita Friuli Orientale, of Trieste, capital 1,000,000 lire; La Società Italiana Porcellane Elettrotechnichi Poul, Milan, capital 125,000 lire; the Società Elettrica Salentina, formed at Bari with a capital of 100,000 lire; La Società Elettrica Latronichese, Latronico, 200,000 lire; and La Società Idroelettrica Stura, Turin, 100,000 lire.

The British Industries Fair. — The Comptroller of the Department of Overseas Trade says that a practical illustration of the advantage to British manufacturers of exhibiting at the British Industries Fair has just been forwarded to the Department by an exhibitor. The firm in question recently received a very large order from an overseas buyer, and as the firm had no agent in that country it was naturally puzzled as to why it had received the order. Accordingly it asked the buyer, who said that it was entirely due to the British Industries Fair catalogue. The buyer, before leaving for England, had asked for the names and addresses of several genuine British manufacturing firms in the particular trades in which he was interested, with the result that a copy of the catalogue was placed in his hands. Not only does this catalogue, which contains the names and addresses of all exhibitors, together with a note of their productions, reach all buyers who attend the Fair, but advance copies are distributed by the Department to known overseas buyers. Its classified index is printed in nine languages, and, retained by buyers for reference as a guide to British manufacturers, constitutes a very valuable advertisement for exhibitors from which results have been known to accrue after the close of the Fair.

Electric Steel Production in Chile.—*Commerce Reports* states that the Cia. Electro-Siderurjica e Industrial de Valdivia, organised by Chilean engineers and capitalists in 1924, has acquired certain hydro-electric rights near the city of Valdivia, Chile. The company, which is to have a capital of 13½ million gold pesos (£1,060,000), will erect a 32,000-h.p. hydro-electric station and works capable of producing 50,000 tons of iron and steel annually. The Government is to be allotted shares to the value of 400,000 pesos and given the right to obtain further stock not exceeding 40 per cent. of the total.

Film Publicity.—The use of the kinema for advertising commercial products calls for a great deal of ingenuity, for it has to be remembered that the large public which attends picture theatres has paid for entertainment, and is not disposed to swallow too much advertising unless this is very skilfully carried out. Film publicity has accordingly become a fine art—the difficult art of combining amusement and advertising. Last week we witnessed a number of up-to-date examples of this class of work, produced by Publicity Films, Ltd., at the Rialto Theatre, Coventry Street, W. These dealt with products so far apart as pills and radio valves, and each possessed originality and interest in a great degree. The producers seem to be capable of treating any subject in a fascinating manner; some of the subjects with which the exhibited films dealt were very unpromising indeed. In the list of the undertakings which have utilised this service we notice the names of several well-known electrical companies.

New Municipal Electricity Offices and Showrooms.—The borough electrical engineer of Plymouth has been instructed to present a report to the Electricity Committee with regard to the establishment in the centre of the town of electrical showrooms and inquiry offices.

American Loan for Norwegian Company.—The Oslo correspondent of the *Financial Times* reports that the Norwegian Power Co., Sandefaldene, has arranged for a $4 million loan in New York at 98 per cent. The security is a first mortgage upon the company's property, plus a guarantee.

Visit to Electrical Showrooms.—On Tuesday last a party of members of the Electrical Association for Women paid a visit to a display of electrical apparatus in appropriate settings at Messrs. Shoolbreds, Tottenham Court Road, W. Mr. Geary gave an address on "The Artistic Value of Electricity in the Home," followed by tea.

Works Visit.—On October 29th a party of wholesalers from the London district visited the Cosmos Lamp factory at Brimsdown, Middlesex, making a tour of inspection of the lamp-making and heating and cooking departments. This was one of many trade visits arranged by Metro-Vick Supplies, Ltd., in connection with its 1925-26 "Cosmos" lamp campaign.

The Rumanian Electrical Market.—The American Commercial Attaché at Bucharest, in the course of a report upon the possibilities for electrical sales in Rumania, says that the use of electric fans in offices, hotels, &c., is increasing, although they are not much employed in the home. There is scope for washing machines, as the home laundry facilities are far from modern. Very few electric cookers are used, and these are mainly of German origin. Grills and immersion heaters are popular and the use of toasters is growing, but electric kettles, percolators, &c., are rarely found in homes. A few radiator type heaters of German manufacture are in use, but there are no luminous heaters on the market. The local dealer buys electrical appliances direct from the manufacturer, and firms undertaking representation usually require an agency for the entire country.

Copper, Lead and Rubber Prices.—Messrs. F. Smith and Co. report November 3rd:—Copper (electrolytic) bars, £69, 10s. increase; do. do. sheets, no change; do. do. wire rods, £79, 10s. increase; do. do. h.c. wire, 9 13-16d., 1-16d. increase.

Messrs. James & Shakespeare report November 3rd:—Copper bars (best selected), sheet and rod, no change; English pig lead, £39 5s., 30s. decrease.

Messrs. Edward Till & Co. report November 3rd:—India-rubber, Para fine, 3s. 9½d., ½d. increase.

Lighting and Power Notes.

Abergele.—Special Order.—The Electricity Commissioners have submitted to the Minister of Transport for confirmation a Special Order made by them authorising the Urban District Council to supply electricity in the district.

Adwick.—Electricity Scheme Hitch.—A difficulty has arisen in connection with the Urban District Council's electricity scheme, on which about £30,000 has been expended, so far as the supply to the district of Woodlands East is concerned. The Council's scheme is to buy electricity in bulk from local colliery undertakings and to distribute to householders at a fixed charge of 1s. 6d. per week for five points per house, and 1s. 7½d. for seven points. The scheme was accepted by public meetings, and the Council proceeded with the installation of cables, &c. Householders at Woodlands East, which is one of the first places to be served, have now submitted a petition demanding a 50 per cent. reduction in the charges, and refusing to take the electricity otherwise. The Council declares that the price fixed is the lowest possible without making the undertaking a charge on the rates.

Barnstaple.—Loan.—The Town Council has applied for sanction to a loan of £2,000 for mains, services and meters.

Barrow.—Hydro-Electric Scheme.—At a meeting of the Town Council, on October 27th, the terms were discussed of the compensation to be given by the Corporation in carrying out the Backbarrow hydro-electric scheme to the Backbarrow Charcoal Iron Co., and the Lancashire Ultramarine Co., whose works are on the banks of the River Leven at Backbarrow, and who own the water rights. The proposed terms with these companies are an allowance of 200 kW and 400,000 kWh per annum free of charge, that each company be paid .375d. per kWh for unused energy up to 400,000 kWh (the maximum payment to each company in any year not to exceed £330), and that the companies pay the Corporation .625d. per kWh for the next 350,000 kWh. The terms also include the installation of motors by the Corporation in both works. Objections were raised to the terms by members of the Council, and it was ultimately agreed that they should be reconsidered by the Negotiating Committee and the final terms submitted to the General Purposes Committee.

Bewdley.—Electricity Supply.—The Town Council has received a communication from the Shropshire, Worcestershire and Staffordshire Electric Power Co. stating that the company's programme for 1926 provided for an extension of the overhead system into Bewdley. It was hoped that the work of the Stourport-Bewdley section would be proceeded with at the beginning of next year, and that an electricity supply would be available by about June.

Bexhill.—New Plant.—The Town Council has sanctioned the purchase of new plant at a cost of £13,600, and an order is to be placed for one 1,250-kW converter and switchgear at a cost of £7,883. A duplicate converter, to cost £5,760, is contingent on financial assistance from the Unemployment Grants Committee.

Canada.—Export of Electricity.—Lack of rain in the State of Washington has caused a serious shortage there this year of hydro-electric power, with the result that heavy calls have been made on the power resources of British Columbia. Arrangements have been made between the Puget Sound Power & Light Co., of Seattle, and the British Columbia Electric Railway, for connecting up their respective systems.—*Reuter* (Vancouver).

Carlisle.—Extension of Supply.—The Electricity Committee is to provide a supply of electricity to the Cocklake Works of the Gotham Co., which will necessitate an expenditure of £6,201 for mains, switchgear, and transformers.

Cheltenham.—Electricity Supply.—At a meeting of the Corporation Electricity Committee the electrical engineer reported having conferred with the Gloucester city electrical engineer as to the future supply of power for the areas of the two authorities, and that they considered it desirable that reports and estimates should be considered by an independent consulting engineer. The Committee has appointed Messrs. Preece, Cardew and Rider to report on the proposals for a joint supply.

Chester.—Rural Electricity Supply.—Two years ago the Corporation obtained sanction for loans amounting to £38,338 for the purpose of distributing electricity in parts of the area covered by the Chester Electricity (Extension) Special Order. The loans have been used to construct three lengths of high-pressure transmission lines aggregating 15.4 miles, and the construction of 29 miles of low-pressure distribution lines. Thirty-seven isolated consumers have undertaken to make yearly payments, which aggregate an income of £1,618 per annum. The distribution lines pass approximately 1,800 premises, of which 605 have either been connected or have applied for a supply. Judging by the inquiries made by the residents in the district, and the interest taken in the scheme, Mr. S. E. Britton has no doubt that the effort the Corporation is making to supply electricity in the rural area around Chester is much appreciated, and when the system has had sufficient time to develop it will be a complete success. The scheme to supply the area, as originally formulated, provided for the construction of three high-pressure transmission lines from Chester towards the boundaries of the area and the interconnecting of these lines so as to form a complete ring line capable of supplying the whole of the area. The three lines and two sections of the ring line have been constructed and are in use. To complete the ring an additional twelve miles of transmission line is required, costing approximately £10,800; a further sum would be required for the provision of additional sub-stations and low-pressure distribution lines, say £9,400, making together a total of £20,000. At a meeting of the City Council on October 28th, a resolution was passed authorising the Electricity Committee to apply for sanction to a loan of £20,000 to complete the scheme.

Clacton.—Electricity Supply.—An extension of its electricity supply to rural areas is to be considered at the next meeting of the Urban District Council. The charges for

electricity to the neighbouring parish of Little Holland have been fixed as follows:—Lighting, 8d. per kWh; power, 3d. per kWh; heating and cooking, 2d. per kWh.

Congleton.—Proposed Electricity Scheme.—At a recent meeting of the Town Council Mr. Vernon Hope, electrical engineer, of Macclesfield, submitted a scheme for obtaining an electricity supply for the town. He recommended the Corporation to obtain a supply from the Stoke-on-Trent Corporation, by means of overhead lines.

Continental.—Germany.—An 80,000-h.p. steam turbine and 60,000-kW Siemens-Schuckert 7,000-V generator have recently been added to the Goldenburg super-power station of the Rhenish-Westphalian Electricity Co. The brings up the capacity of the plant to 290,000 kW, making it the largest generating station in Germany using lignite as the steam-raising medium.

Austria.—According to a report lately drawn up by the Austrian Ministry of Commerce and Communications, there were at the commencement of the current year 537 generating plants with a maximum capacity of 89,087 h.p. in operation. The report shows that 244 new hydro-electric stations, representing a total of 292,754 h.p., were in course of construction at the beginning of 1925, the most important being the Luner Lake station of 60,000 h.p. which the Vorarlbergen Ilwerke Gesellschaft is erecting in the Vorarlberg.

Bulgaria.—The Government has nationalised all available water power and announced the terms on which it is prepared to grant concessions. Among the more important hydro-electric stations now in course of construction are the Watschar on the River Kritschin and the Orion undertaking on the Rila river. The last-named will comprise three stations at Rila, Pastra, and Ilina respectively. The first portion of the Pastra plant has already been completed; it comprises three 3,300-h.p. Francis type turbo-alternators. The output is being utilised in the town of Subrica, at various works in the vicinity, and at the State Collieries at Pernik.

Croydon.—Loans Sanctioned.—The Corporation Electricity Committee has received sanction to loans of £17,410 for boiler-house buildings and £23,719 for boiler-house plant.

Eccles.—Year's Working.—The accounts of the Corporation electricity undertaking (engineer: Mr. H. W. Angus) for the year ended March 31st last, record a total revenue of £41,018, as compared with £36,928 in 1923-24. Working expenses amounted to £29,331, as against £24,782, leaving a gross profit of £11,689 (£12,146). After deducting capital and other charges there was a net surplus of £3,377, as compared with £4,480 in the preceding year. This was transferred to the reserve fund, which now stands at £12,778. The capital expenditure during the year amounted to £12,483, and included £9,199 for mains. The sales of electrical energy increased from 4,332,172 to 4,942,464 kWh.

Exeter.—Electricity Agreements.—The Topsham Parish Council has accepted the terms offered by the Corporation Electricity Department for street lighting, and the Crediton Urban Council has also accepted the terms for a supply of electricity in its area.

Halifax.—Year's Working.—The report on the working of the Corporation electricity undertaking (engineer: Mr. W. M. Rogerson) for the year ended March 31st last, records a total revenue of £180,679, as compared with £178,596 in 1923-24. Working expenses amounted to £96,546, as against £91,130, leaving a gross surplus of £84,133 (£87,466), to which was added interest on investments, making a total of £88,652. After providing for capital charges a net profit of £23,026 remained, as compared with £32,596 in the preceding year. A contribution of £6,864 was made to the borough fund. The amount spent on capital account during the year amounted to £100,236, and included £43,153 for machinery and £11,905 for mains and services. The electrical energy sold increased from 21,367,440 to 23,668,249 kWh, and the average price obtained fell from 2.005d. to 1.832d. The maximum supply demanded rose from 11,150 to 12,540 kW.

London.—Stepney.—*Year's Working.*—The report of the borough electrical engineer, Mr. W. C. P. Tapper, on the working of the electricity undertaking for the year ended March 31st last, shows a total income of £287,505 and working expenditure of £153,287, leaving a gross profit of £134,218. The corresponding figures for the previous year were £261,283, £148,373, and £112,910, respectively. To the gross surplus were added receipts from other sources, making a total of £141,389 available. Capital charges absorbed £85,707, and there was a net surplus of £55,682, as compared with £38,736 in 1923-24. The capital expenditure during the year amounted to £135,957, the chief items being £42,492 for machinery and £51,999 for mains. The sales of electrical energy increased from 42,140,142 to 44,520,753 kWh, and the average price obtained from 1.476d. to 1.528d. The maximum load rose from 19,070 to 21,680 kW.

Sliding Scale Prices.—A decision has been arrived at by the Electricity Commissioners that the effective date of operation for the sliding scale of prices and dividends relating to those companies affected by the London Electricity (Nos. 1 and 2) Acts, 1925, shall be January 1st, 1926. The companies concerned are to fix their standard prices for approval by the L.C.C., in order that the sliding scale may come into effective working at the earliest possible date.

Manchester.—Progress during September.—During the month of September the Corporation electricity undertaking showed an increase in connections of 1,353 kW, bringing the total to 269,703 kW; and the number of applications received for supply, including existing consumers for additional supplies, was 929, representing a total of 2,155 kW. The number of consumers connected increased by 394, and the number of hired cookers connected by 62, bringing the total actually on circuit to 990. Applications for the hire of cookers totalled 100.

Northern Ireland.—Portrush (Co. Antrim).—A fire recently occurred at the municipal power station. The outbreak originated in a store where oils, cable, bitumen, and other inflammable materials were kept, and this part of the building was gutted. The fire spread to the roof of the main buildings of the station, which was considerably damaged.

North Wales.—Electrical Development.—At a recent meeting of the North Wales and South Cheshire Joint Electricity Authority, at Llandudno, it was reported that the following transmission lines had been completed:—The Trevor to Pwllheli section, the St. George section, and the section from Connah's Quay to Bagillt. Considerable progress had also been made with regard to the lines from Llanfrothen to Four-crosses, Cwm Dyli to Llanfrothen, Legacy to Crewe, and Hawarden to Mountain Colliery, and work had commenced on the Llanfrothen to Maentwrog and Crewe to Sandbach sections. The actual construction of the main dam of the new reservoir at Maentwrog is proceeding, the foundations having been laid. The meeting decided to communicate with the North Wales Power Co. with a view, eventually, to submitting a report to the Electricity Commissioners on the policy which it may be desirable to adopt with the object of carrying electricity into rural areas.

Lake Dam Bursts.—It is reported in the daily Press that the North Wales Power Co.'s lake dam above Dolgarrog, in the Conway Valley, burst on November 2nd, and the water poured down the hillside. Apparently the Eigiau dam burst about 9.30 p.m., and the water swept away the smaller dam. Buildings were damaged, cattle drowned, and loss of life is reported.

Plymouth.—New Plant.—Application is being made by the Corporation Electricity Committee for sanction to a loan of £41,275 for additions to the generating plant. It is proposed to remove two obsolete engine-driven sets at the Prince Rock power station and replace them with an additional turbo-alternator with a capacity of not less than 6,000 kW, together with the necessary auxiliaries, pipework, and switchgear. The estimate also covers an additional converter.

Preston.—Electricity Supply.—The Electricity Committee is applying for sanction to further loans, including £4,250 for the alteration of the system of supply in the Ribbleton area and £900 for the equipment of a meter test room at Crown Street. The Council has been asked to approve the agreement for the supply of electricity in bulk to Blackpool, together with resolutions for sanction to the construction of transmission lines at a cost of £66,000 (each Corporation paying one-half).

Price Reductions.—Reductions in the charges for electricity have been made or recommended in the following districts:—

London.—*The Charing Cross Electricity Supply Co., Ltd.*—Heating and cooking: Reduced to 1½d. per kWh.

Brighton.—Sliding scale: First 10,000 kWh per annum from 5d. to 4½d. per kWh; second 10,000 kWh, from 4d. to 3½d.; next 10,000 kWh, from 3d. to 2½d.; all energy in excess of 30,000 kWh to remain at 2d. per kWh as at present. Power, heating and cooking: Flat rate from 1½d. to 1d. per kWh. Street lighting: From 2d. to 1¾d. per kWh. Electricity supplied in the areas of Southwick, Portslade, and Rottingdean to be charged at 7d. per kWh for lighting, and 2d. per kWh for power.

Rugeley. — Electricity Scheme. — The Urban District Council, after considering a draft agreement with Major C. H. B. Prescott-Westcar with reference to an electricity scheme, decided that the agreement should contain a clause to the effect that the company shall, if requested by the Council, supply electricity for street lighting. Mr. W. H. Robins, borough electrical engineer, Stafford, has been asked to advise the Council on the technical side of the scheme.

Skegness. — Electricity Supply. — The Urban District Council has revoked a former decision to take a bulk supply of electricity from the power station of the National Electricity Construction Co., Ltd., at Boston, and has decided to install its own generating plant.

South Africa.—Durban.—According to the *South African Power Engineer* the plant at present installed in the municipal power station will be unable to cope with the demand for power until such time as the Electricity Supply Commission's power station at Congella (which is not due for completion until October, 1927) is in working order, and the Town Council is now in consultation with the Commission regarding the purchase of another 5,000/6,000-kW turbo-alternator set, which, with the first set recently installed, will be ultimately taken over by the Commission at a price to be mutually agreed upon, and installed by the latter in its Congella station. A second 45,000/60,000-lb. boiler will also be required, and it is anticipated that this, as well as a plant of similar capacity installed at the municipal station about a year ago, will also be taken over by the Commission.

West Mersea.—Opposition to Scheme.—The proposal to establish a hydro-electric generating station on the creeks at West Mersea, near Colchester, is being opposed by the Parish Council on the grounds of alleged damage to navigation, oyster fisheries, and the health of the district.

Willesden.—Year's Working.—The accounts of the Urban District Council's electricity undertaking (engineer: Mr. A. W. Blake) for the year ended March 31st last show a total income of £133,678, as compared with £118,492 in the preceding year. Working expenses, including the purchase of a bulk supply from the North Metropolitan Power Supply Co., Ltd., amounted to £98,105, as against £82,975, leaving a gross profit of £35,573 (£35,517), to which was added revenue from other sources, making a total of £45,622. Capital charges absorbed £35,884, and works of a capital nature charged to revenue amounted to £15,613. Thus there was a deficit of £5,876, as compared with a surplus of £8,402 in 1923-24. The capital expenditure amounted to £38,957, and included £12,798 for mains and services. The electrical energy sold increased from 12,590,487 to 15,109,106 kWh, and the average price per kWh obtained fell from 2.259d. to 2.123d. The maximum supply demanded rose from 7,206 to 8,330 kW. During the year the work of converting the street lamps from gas to electricity was completed, and a 750-kW converter was installed at Salusbury Road sub-station.

Windsor.—Reduction of Maximum Charge.—The Windsor Electrical Installation Co., Ltd., has applied for a Special Order to reduce the maximum price of electricity from 1s. to 10d. per kWh, with the deletion of the minimum quarterly charge.

Wirral.—Inquiry.—The Electricity Commissioners are to hold an inquiry on November 17th into the Rural District Council's application for a loan of £135,000 to cover the cost of its electricity scheme.

Worthing.—New Plant.—Acting on the advice of the borough electrical engineer, Mr. G. Porter, the Town Council has decided to apply for consent to an extension of its generating plant by the installation of one 750-kW Diesel set at an estimated cost, including foundations, switchgear, cable connections, and other accessories, of £15,850.

Tramway and Railway Notes.

Birmingham.—Accident.—The first accident to be recorded on the railless-car system occurred on October 30th. A tram-car was proceeding from the city to Nechells when the steering gear broke and the vehicle crashed into an electric cable standard. Five of the passengers received serious injuries and were conveyed to hospital for treatment.

Brighton.—Tramway Extension.—The Tramways Committee has decided to extend the Lewes Road tramway track to Natal Road, at an estimated cost of £11,000.

Colne.—Track Renewals.—The Town Council has received sanction from the Minister of Transport to a loan of £3,700 for the renewal of the tramway track in Burnley Road.

Continental.—Spain.—Work is well in hand on the construction of an electric railway between Zumarraga and Zumaya, which will connect the Northern of Spain (Madrid-Hendaye) railway with the Vascongadas (Bilbao-San Sebastian) line. The new line, including a branch to the harbour at Zumaya, will be about 23 miles in length, and is expected to be ready for operation within 12 months.

Norway.—*Modern Transport* states that the Holmen Kollen Co., of Oslo, has arranged for a loan of 11,500,000 kroner with a consortium of Norwegian banks and insurance companies, for the construction of an underground railway.

Belgium.—The Société Nationale des Chemins de Fer Vicinaux, of Brussels, has decided to extend the local railway between Ostend and Westende as far as the Franco-Belgian frontier. The work will be put in hand as soon as the financial arrangements have been completed with the Government.

The Société des Tramways Electriques du Pays de Charleroi et Extensions is extending the electric tramway between Charleroi and Couillet to Chatelet, and the Charleroi-Gilly line to Vieux Campinaire.

Italy.—The Minister of Railways and Communications has authorised the immediate electrification of the line from Genoa to Ovada; authority has already been granted for the electrification of the Ovada-Alessandria line. It is also proposed to electrify the route from Ovada to Asti.—*Reuter's Trade Service* (Rome).

A new electric railway has lately been completed and opened for traffic between Intra and Premeno.

Austria.—The *Gazette de Prague* says that in addition to the electrification of the Innsbrueck-Bludenz section of the railway from Arlberg, which was opened four months ago, the Austrian Federal Railway Board has recently electrified the Stanach-Inning and the Attnang-Puchheim lines, the total length of which is 243 km. The necessary power is supplied by a station on Lake Spuller, and the economy in coal resulting from the electrification of these two lines will amount to about 130,000 tons a year. The electrification of the Salzburg-Woergl-Innsbrueck-Brenner, Kufstein-Woergl and Simmering-Gloggnitz-Murz lines will be begun in the near future.—*Reuter's Trade Service* (Prague).

London.—Inauguration of Watford Line.—The new electric railway from Baker Street to Watford, *via* Croxley Green, constructed by the Metropolitan and the London & North-Eastern Railway Companies, was formally inaugurated on October 31st and opened to the public on Monday last. There is a service of 140 trains a day, a proportion of which is electrically operated by the Metropolitan Co. to Baker Street. The London & North-Eastern Railway Co. has introduced a new steam train service between Watford and Marylebone. The cost of the scheme was £300,000.

Newcastle-on-Tyne.—Purchase of Undertaking.—At a meeting of the Corporation on October 30th, it was agreed to purchase the tramway undertaking of the Tyneside Tramways and Tramroads Co. for £118,125.

Port Stewart.—Abandonment of Route.—According to the *Electric Railway and Tramway Journal*, the London, Midland and Scottish Railway has decided to abandon the tramway service between the railway station and the town, and to replace it by a motor-omnibus service. The tramway track is in a bad condition, and the company does not consider it advisable to incur the expense of reconstruction.

St. Helens.—New Type of Tramcar.—A new design of tramcar, built in the Corporation tramway sheds, will shortly be put into service. The car will carry 82 passengers, 30 below and 52 on top. The new seats, which are placed across the car, are of the tip-up type. A special type of compressed-air brake is also fitted to the car.

Venezuela.—Railway Electrification.—According to *Commerce Reports*, work on the electrification of the railway connecting Caracas with its port, La Guaira, is reported to be starting within a few months. Most of the necessary material has been ordered from England. The power station, which will probably be situated at Zig Zag, will be equipped with Diesel engine sets. The present 30-ton steam locomotives will be replaced by five electric units of 35 tons each. The cost of electrification, including the new rolling stock, is estimated at $750,000, and the length of line is 23 miles.

Yorkshire.—Route to be Abandoned.—The Yorkshire (West Riding) Tramways Co., Ltd., has announced that it is withdrawing the whole of its tramway service on the route between Pontefract, Castleford, and Normanton. Since the introduction of motor-omnibuses on the route there has been a considerable falling-off in the receipts, and the company has decided to substitute an improved 'bus service.

Telegraph and Telephone Notes.

China.—New Telephone Co.—The Hongkong Telephone Co., Ltd., is a new local (British) company, whose scheme for the acquisition of the China and Japan Telephone Co. has been approved by the Government of Hongkong, according to the *T. & T. Age*. It was planned that the shares of the old company would be bought up for 1,400,000 Hongkong dollars, and that the new company would have a capital of 5,000,000 Hongkong dollars issued as 500,000 shares of 10 Hongkong dollars each.

Irish Free State.—Telephone Service.—In a recent address to the Dublin Chamber of Commerce, Mr. J. J. Walsh, Minister for Posts and Telegraphs, sketched the work of his department since it was taken over by the Free State. The deficit in the working of the Post Office, he said, according to the *Irish Times*, had been reduced from £1,400,000 to £540,000. For the first time in the history of the country the telephone system had shown a profit, and he favoured concentration on the telephone as the service most likely to benefit the business community. In Dublin underground schemes of considerable magnitude were in progress, and, since 1923, 54 miles of conduit had been laid, 123 manholes and footway chambers constructed, 94 miles of cable drawn in, 480 new distributing poles had been provided, 36 additional trunk lines had been set up, and new main distributing frames for 10,000 lines at the Central exchange, 3,200 lines at Ship Street, and 6,000 lines at Merrion Street had been installed. Now there were three trunk circuits between Dublin and Cork, two between Dublin and Limerick; one connecting Cork and Dublin, and when the traffic justified it another could be provided at once. It was expected that the first automatic exchange would be working in Dublin by the end of next year. A relief exchange was being installed in Merrion Street to relieve the congestion in the Central Exchange, and to open up an area which had been closed for some time owing to shortage of plant. A new exchange would be installed in Limerick early next year, and arrangements were being made for replacing the old exchange at Cork by up-to-date equipment. In March, 1922, there were 19,101 telephone stations, and at the end of September last 10,006 stations had been added. Principally owing to the depression in trade, 7,347 stations ceased operation during the same period, leaving a net increase of 2,759 stations. The present total was 21,800 stations. There were 194 exchanges in the Saorstat in March, 1922. Since then 127 new exchanges, of which 80 had been opened since the beginning of the year, and 210 telephone call offices, had been completed. There were now 762 call offices, as compared with 552 in 1922.

Party-line Telephones.—The Free State Posts and Telegraphs Department is endeavouring to encourage and extend the use of the party-line system of telephone service in rural districts.

(*Continued on page 743.*)

Swiss Railway Electrification.

Some Particulars of Recent Power-Transmission and Railroad Schemes.

Electric traction on the Swiss railways has been entirely satisfactory up to the present, and is a constant source of congratulation amongst the Swiss themselves, who

Fig. 1.—A St. Gothard Locomotive.

feel delightfully independent of their neighbours' coal, and pleased with the cleanliness and increased travelling speed on the electric railways.

Fig. 2.—Electric Train on Meienreuss Bridge.

The whole of the network of Federal railways is not yet electrified, but by 1928 it is hoped 1,566 km. of track will be completed; this will include practically all the lines of the C.F.F. At the present time, the greater part of the railroad, with the exception of about 76 km., which is still run on a three-phase system, is supplied with single-phase energy at $16\frac{2}{3}$ periods, 15,000 volts. The different hydro-electric generating stations are linked up by an overhead transmission line at very high pressure, the distance between the distribution stations not exceeding 60 km., so that it is hoped that about 30 of the latter stations will be sufficient, taken in connection with the five big power houses, to supply the C.F.F. in its entirety in 1928. The transmission lines are mounted on open-work iron transmission towers, and the energy is transmitted at 60,000 V and at 30,000 V on the underground cables between Ritom-Amsteg-Glarnico. The converters in the distribution stations are generally 3,000- or 5,000-kVA machines, capable of dealing with 4,500 or 7,500 kVA for half-an-hour. The Gothard distribution stations are covered in, but those of more recent construction are of the out-door design, and have therefore cost less to erect. The contact overhead wires are of copper, and are supported by steel, copper-eased steel, or iron wires.

As to the locomotives and automotrices used by the C.F.F., they are of differing weight and type according to whether they are for use on the long steep declivities of the St. Gothard, or the easier slope of the Simplon, or the flat ground of the plateau. All are fitted with hand brakes and Westinghouse brakes, and the Gothard machines have an electric brake as well. Their maximum speed varies from 40 to 90 km. an hour according to the power and grade, and the kind of train to be drawn. Each locomotive is furnished with extra plugs affording a supply at from 800 to 1,000 V for the heating of the train. The railway carriages are each fitted with a radiator, or radiators, and during the coldest season the energy consumed for heating amounts to about 120 to 130 watt-hours per axle-kilometre. On the express trains, in which are included non-electrically-equipped carriages, coal-vans are placed between such carriages, so as to warm them by steam.

Extensive railroad schemes are also in hand. The Berne-Geneva section, which was expected to be finished by the end of this year, with the enlargement of the station at Romont, includes no fewer than eleven bridges between Renens and Nyon, and nine betyeen Nyon and Geneva, and also three viaducts. The total cost is estimated at three million francs. It is interesting to learn that an expenditure of a million francs has been incurred during the past year in replacing or reinforcing bridges, while considerably over two million francs has been spent on the provision of plant for the

Fig. 3.—St. Gothard Tunnel Entrance.

lighting and heating of coaches, goods vans, &c. The Federal Railways, whose plant at Vernayaz was

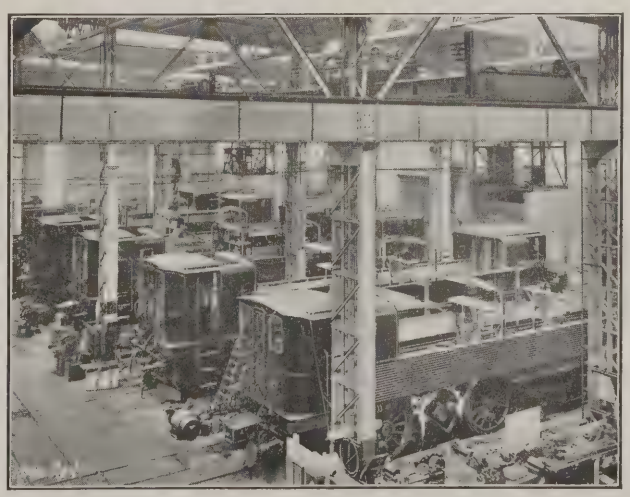


Fig. 4.—Electric Locomotives Under Construction.

to have a capacity of 108,000 h.p., were recently in negotiation for land for a new station at Etzee.

E

Electrical Developments at Stoke-on-Trent.

Extensions to the Plant at the Hanley Generating Station.

On Thursday, October 15th, the development of the Stoke-on-Trent electricity supply undertaking was marked by the inauguration of considerable extensions at its Hanley generating station, one of a group of five such stations completing the system. The Hanley works was the original station of the group, and was established in 1894. The group includes the central power house to which the other stations at Hanley, Longton, Stoke-upon-Trent and Burslem act as sub-stations. The new plant consists of four boiler units, a 6,000-kW turbo-alternator and auxiliaries, and two cooling towers.

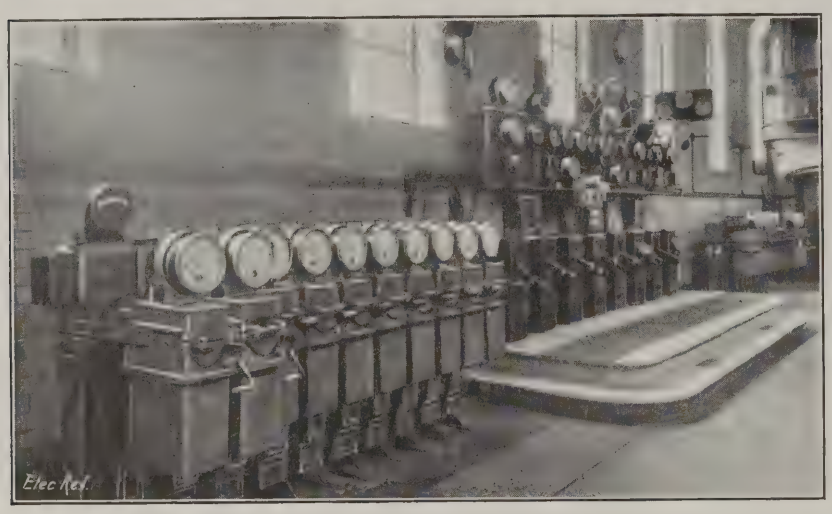

Fig. 1.—Switchgear at Hanley Sub-works.

Each boiler unit consists of a Stirling three-drum water-tube boiler, with two self-contained "Underfeed" chain-grate stokers. The total heating surface of each unit, including boiler, superheater, and economiser, is 8,632 sq. ft., and the normal output is 30,000 lb. of steam per hour at a pressure of 260 lb. per sq. in., and a temperature of 600 deg. F. The guaranteed efficiency is 84 per cent. on normal duty. The economisers are arranged at the rear of the units, while the induced draught plant, chimney, and grit arresters are carried on a platform above the boilers. Each boiler is fitted with Dewrance mountings, a Kent's steam-flow meter, a Cambridge CO_2 recorder and distance thermometers for indicating the steam, feed water inlet and outlet, and flue gas outlet temperatures. Two of the boilers are fitted with "Crosby," and two with "Copes" automatic feed water regulators. The stokers are designed for burning coal having a calorific value of from 10,500 to 12,500 B.th.u. per lb., and the consumption of each is measured by Lea coal meters. The induced draught fan for each boiler is driven by a 27-b.h.p. motor at 480 r.p.m. The runners are 45 in. in diameter.

The new generating set consists of a 6,000-kW turbo-alternator, fig. 2, with suitable surface condensing plant, the complete set having been constructed and installed by the Metropolitan-Vickers Electrical Co., Ltd. The turbine is of the impulse type, and is designed to give an economical output of 6,000 kW with a stop valve pressure of 250 lb. per sq. in., and a superheat of 250 deg. F.

The alternator is designed for a continuous output of 7,500 kVA at 0.8 power factor, 3 phase, 51½ periods, 6,000-6,600 V. It is of standard design, with steel slip rings and overhung exciter, having a radial commutator. The stator windings are protected by the Merz-Price balanced-current system, and by an automatic field switch mounted behind the switchgear control panel. The stator core has embedded thermo-couples, and the machine is fitted with the M.-V. closed circuit ventilating system.

The condenser, fig. 3, is of the surface type, having a cooling surface of 8,250 sq. ft. It is designed to maintain an absolute pressure of 1.72 in. at full load (corresponding to 28.28 in. vacuum) when supplied with cooling water at 70 deg. F. Air extraction is effected by either of the two-stage air ejectors with jet intercoolers which are mounted on the turbine floor level. Two rotary condensate extraction pumps are provided, each being designed to deliver 104,000 lb. per hour against a head of 60 ft. The cooling water is circulated through the condenser by either of the two centrifugal pumps, each designed to deliver 288,000

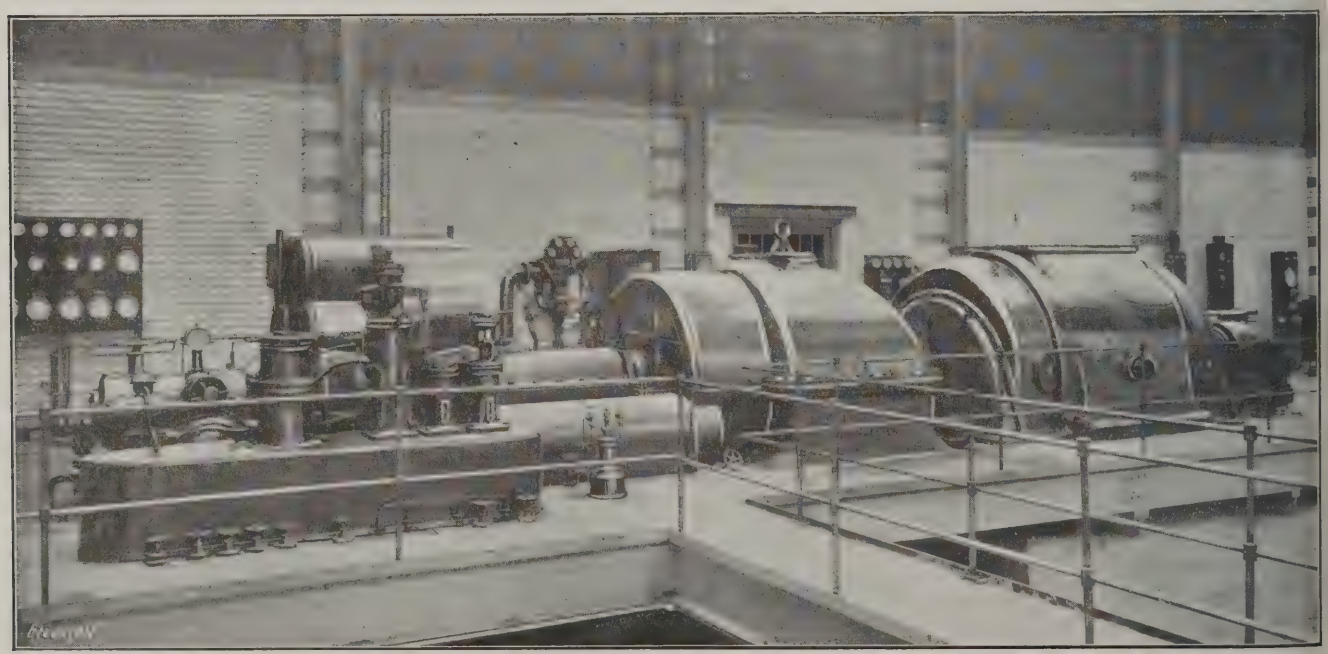

Fig. 2.—The New 6,000-kW Turbo-generator Set.

gallons per hour against a 44-ft. head. The switchgear controlling the alternator and the cables linking up the new set to the existing bus-bars have also been supplied by the Metropolitan-Vickers Co. With the new No. 5 set a radical departure has been made from the old system, and the switchgear is of the totally enclosed "ironclad" type, embodying many of the original features, such as the draw-out type switch, and mechanical interlocks. The type K3 switches controlling the new set are rated to carry 1,200 A at 6,600 V, with a breaking capacity of 300,000-kVA. The two bus-bar switches are non-automatic. The alternator switch is tripped automatically either by the operation of the Merz-Price relay, or by an inverse time limit overload relay of the new "PB" type. Fig. 1 shows the switchgear at the Hanley sub-works. In the basement, close to the alternator, is mounted an earthing resistance, controlled by an electrically-operated oil switch. The resistance is designed to carry 660 amps. leakage current for 30 seconds, or 110 amps. continuously. A Reyrolle low-pressure distribution switchboard is also provided in the new equipment.

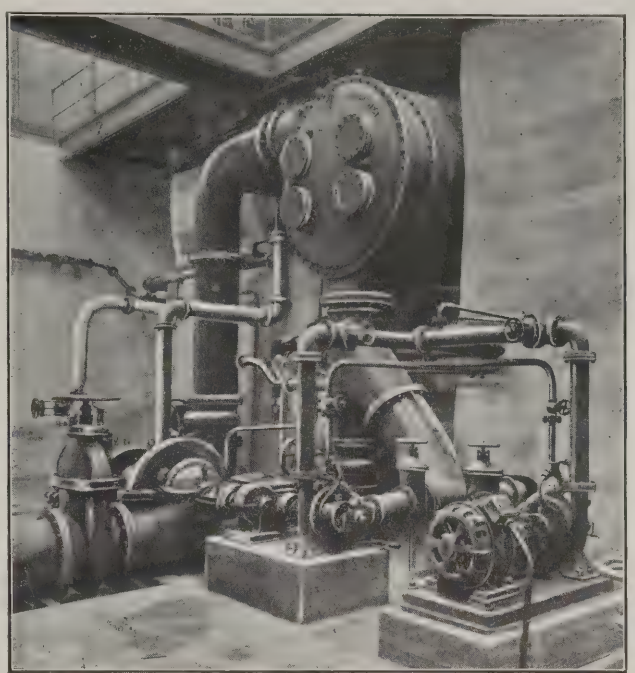

Fig. 3.—New Condensing Plant.

Two extension cooling towers by the Davenport Engineering Co., Ltd., of Bradford, have also been installed. They are of the natural draught, chimney type, and are designed to deal collectively with 400,000 gallons of circulating water per hour, reducing the temperature of this water from 86 deg. F. to 74 deg. F. with a wet bulb atmospheric temperature of 55 deg. F.

The extension coal bunkers, conveyors and elevator have been manufactured and installed by Ashton, Frost & Co., Ltd., of Blackburn. The coal is brought to the central power house from either the railway siding or the collieries direct by three automatic end-tipping battery electric vehicles.

A Fifeshire Hydro-Electric Undertaking.

The Balgonie Colliery Co.'s Installations.

Were it not for the facts that good coal is available at a reasonable price and that most of her larger potential water power sites are remotely situated in relation to the industrial areas where the power might be used, Scotland's hydraulic resources would have doubtless been developed more rapidly than they have been for the production of electricity. It is accordingly of interest to note that the Balgonie Colliery has had the enterprise to develop the River Leven, which flows out of Loch Leven through its property, with a total fall of 56 ft., for power production purposes.

The Balgonie Colliery Co. has operated upon the Dysart main seam between the rivers Orr and Leven, in the upper Fifeshire coalfield, for over four centuries, and it is of interest to point out that nearly two centuries ago the colliery took advantage of the power of the river to drive a water-wheel pumping installation. The old lade which was then constructed, 2,000 yards in length, with the head works and tail race were later reconstructed and utilised in connection with the development in 1919 of a 13-ft. fall at the Milton Mill, from which it has been possible to obtain as much as 239 h.p.

The Milton plant consists of a double-runner open-type turbine with a central discharge, and separate gate control for each runner in order to obtain economy of water. The power developed by the turbine is transmitted to the generator through a set of double-helical spur gears arranged for forced lubrication, the gears increasing the number of revolutions of the turbine from 155 r.p.m. to 800 r.p.m. on the generator. A flywheel is fitted to the generator shaft, and the connection of the gear shaft to the generator is by a flexible coupling of the belt type.

Fig. 1.—Castle Hydro-electric Station, Fifeshire.

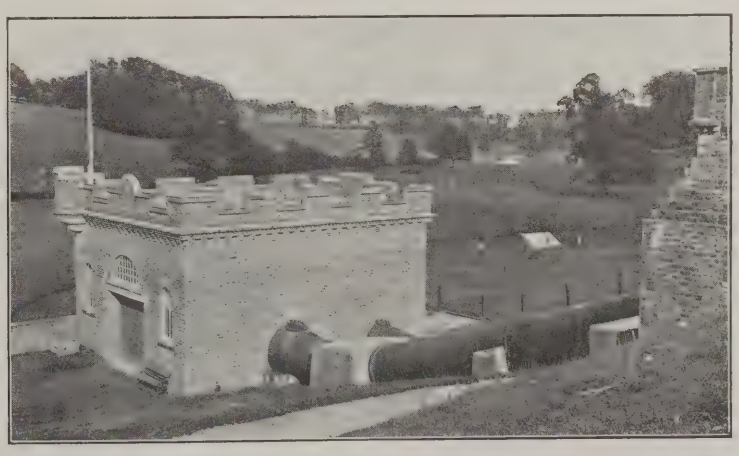

Fig. 2.—Back View of Castle Station.

The generator is a direct-current compound-wound machine with an output of 160 kVA at 440 volts. The speed of the alternator is controlled by an oil-pressure governor which automatically regulates the guide vane of the turbine. This installation was supplied complete by Messrs. James Gordon and Co., Ltd., and the results obtained were so encouraging that the Balgonie Company decided to develop the other 44 ft. of available head.

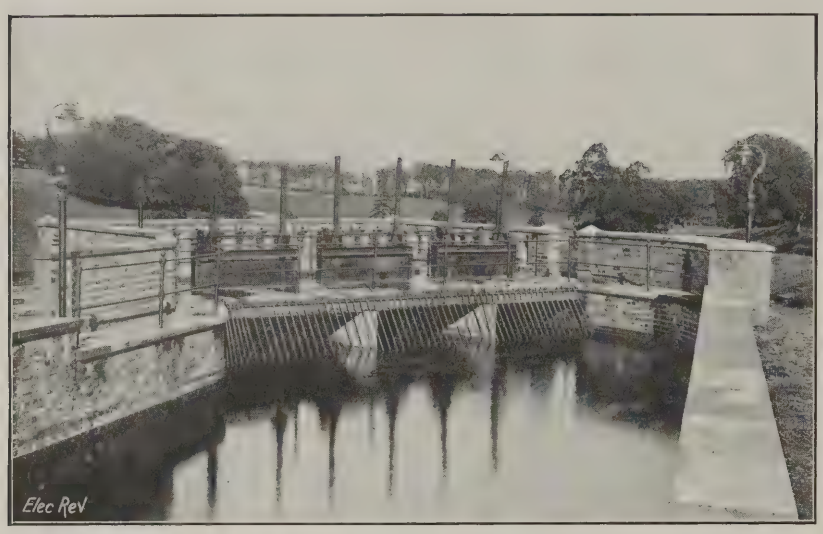

Fig. 3.—Intake, Showing Screens.

Incidentally, it should be stated that during the coal miners' strike of 1921 this Milton plant supplied power to the pits and the pumps, when no other sources of power were available, and thereby prevented flooding and the consequent serious damage underground and loss to the mine.

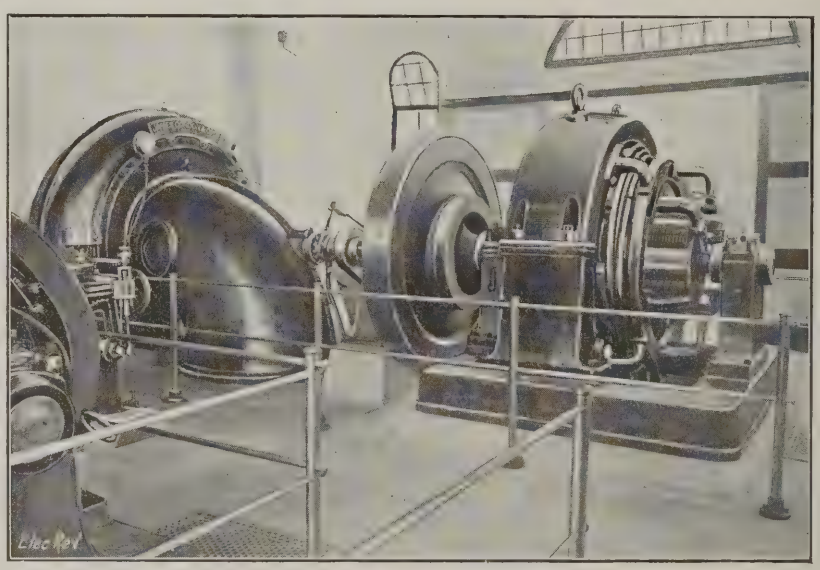

Fig. 4.—The 550-H.P. Turbo-generator.

The second plant, the Castle installation, is a much more extensive one, and necessitated a considerable amount of civil engineering work, in addition to the installation of the water-power plant proper. After a careful survey of the site and prevailing conditions, it was decided to lead the water to the turbines by means of a new headrace cut in earth, over a mile long and 22 ft. wide, and from the end of this by two short riveted-steel pipe lines (figs. 1 and 2).

The main intake from the river is controlled by three sluice gates, in addition to a by-wash gate in the weir. No puddle clay was used in the construction of the headrace, a procedure that has been fully justified by the results obtained. The first 100 yards, however, had to be constructed of substantial brickwork, as the North British Railway Co. made this a condition before permitting the headrace to be carried under one of the arches of the Markinch Viaduct. A by-wash is arranged near the pipe-line intake to take overflow water and to maintain as far as possible constant head on the turbines.

At the end of the headrace an intake (fig. 3), built in concrete and bricks, is arranged in which three sluice gates, each 7 ft. wide, are situated. The intake is divided into two sections, each complete with its own fine strainer, so that access to any one of the two pipe-lines and turbine can be obtained without interfering with the working of the other turbine. A set of coarse strainers is fitted in front of the sluice gates in order to catch heavy debris without interfering with the water flow. The intake is arranged with reinforced-concrete platforms to give convenient access to the strainers and sluices. After its removal from the strainers, debris is pushed along the platform to an opening in the parapet wall, from where it is thrown down on to a steep slope where water from the wash-out valves in the headrace acts as a powerful conveyor of the debris into a basin below. This cleaning of the water at the Castle installation almost eliminates the necessity of cleaning the strainer racks at the Milton installation lower down the river.

The pipe-line consists of two riveted-steel pipes both 63 ft. long; the one serving the large turbine is 60 in. in diameter, and that serving the smaller turbine is 54 in. in diameter. There is no necessity for expansion joints in this case, but a wedge-shaped section is provided at the junction of the turbine and the pipe-line to permit easy removal.

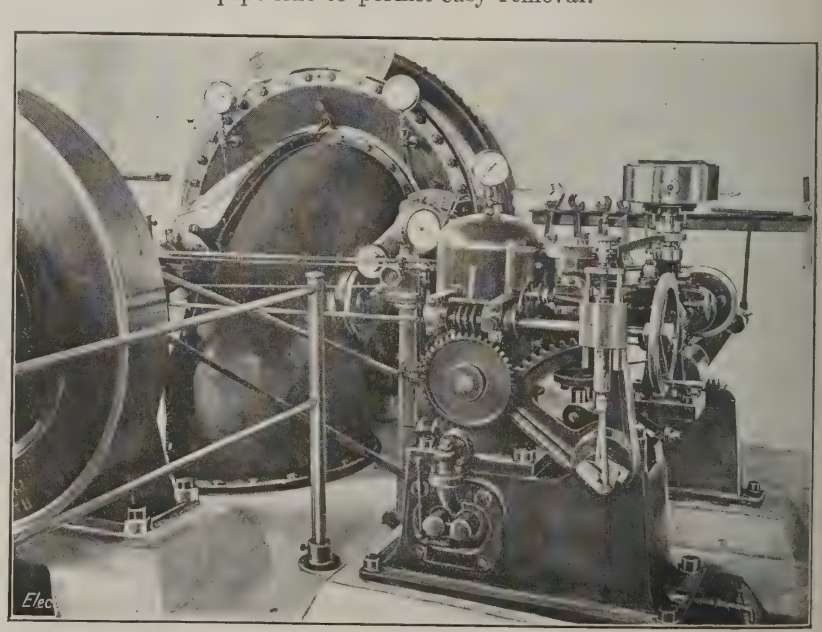

Fig. 5.—Turbine Governor Gear.

The turbines themseles are of the axial-entry cased type. The working head is 40 ft., and the larger tur-

)ine (fig. 4) is producing with this head 550 h.p. at 280 r.p.m., the smaller one giving 270 h.p. at 400 r.p.m. The turbines are fitted with cast-iron flywheels, and coupled direct through belt-type flexible couplings to the generators, which are of the direct-current type working at 450 volts. The load is of an exceptionally varying nature, but it has been found that the two oil-pressure governors (one of which is illustrated in fig. 5) are easily capable of taking care of all variations in a most satisfactory manner.

The switchboard embodies the usual equipment for an installation of this kind, which is arranged for working in parallel. A 4-ton overhead hand-operated crane is also provided.

The power generated at the Castle power station is conveyed by underground feeders to overhead lines. The feeders comprise two 1.0-sq. in. paper-insulated, lead-covered, and heavily braided cables in parallel per pole, positive and negative. The feeders are laid in wooden troughing, this being a mechanical protection only, as the feeders pass through fallow ground. The connection to the overhead line forms a "tee," as this line feeds in two directions, one to a sub-station at the Milton Colliery surface workings, where there is mining type ironclad switchgear with change-over switches for the purpose of supplying the Milton mine with power, either from the Milton or the Castle power stations, as may be found most convenient. The overhead line also feeds a sub-station where powder is distributed to the Julian pit and other underground workings. The Julian pit has a large steam generating plant, and the arrangement of the switchgear is made so that either, or both, the Castle water-power station or the Julian pit steam station can supply power wherever and whenever it is required.

It will be noticed from the accompanying illustrations that not only has the Balgonie Colliery Co. taken great care and trouble on the technical side of the installation, but has gone to considerable trouble to produce an exceptionally pleasing exterior of both intake and power house, all in keeping with the surrounding neighbourhood, where the Balgonie Castle dominates the architecture.

The civil engineering work was carried out under the supervision of Mr. W. Proudfoot, of Kirkcaldy, whereas the water-power plant proper, with the turbines, pipe-lines, strainers, &c., were supplied and installed by Messrs. James Gordon & Co., Ltd. The generators were supplied by the English Electric Co., Ltd., and the transmission line work was carried out under the supervision of Mr. R. M. Russell, of Glasgow.

This installation, despite its rather high capital outlay, has been a great commercial success. Electricity was first introduced at Balgonie in 1895, and considerable development has taken place underground in recent years. Haulage motors are in use on the main and service roads, and there is not a single pony in the pits, while it has been found possible to utilise cutters and conveyors at all the faces; in one pit the whole of the output is gotten with the aid of cutters, and in another only one per cent. of the production is obtained by the hand and pick.

B.E.S.A. Specification.—The British Engineering Standards Association has issued a specification (No. 230, 1925), which covers the requirements for portable photometers intended for the measurement of illumination, and in some cases of brightness also, under conditions where portability and convenience in use are of more importance than great accuracy. The specification includes definitions of the principal terms used in photometry, which are in accordance with the decisions of the International Illumination Commission, in so far as such decisions are applicable. It divides the photometers into two ranges: A, those intended for use in measuring exterior illumination, and B, those intended for use in measuring interior illumination. It is specified that the effective range of a range A portable photometer shall be from 0.01 to 2 ft. candles, and that that of a range B portable photometer shall be from 0.2 to 20 ft. candles. The questions of weight, the test and comparison surfaces, the use of reducing screens, the electrical measuring instruments, the comparison lamp and battery, and also the limits of error to be permitted, have all been gone into carefully. Copies of the specification may be obtained from the B.E.S.A. Publications Dept., 28, Victoria St., London, S.W.1, price 1s. 2d. post free.

Telegraph and Telephone Notes.

(*Continued from page 738.*)

Costa Rica.—Telephone Agreement.—An operating agreement for the telephone system of San Jose and vicinity was signed by a representative of the Compania Nacional de Electricidad and the President of Costa Rica on August 26th. *Commerce Reports* explains that the company agrees to keep all its present lines in operation should the number of subscribers warrant it, install only modern equipment, and within one year erect a new line connecting Cartago and Alajuela with a branch to Heredia. Within 18 months a new connection must be constructed between San Jose and Puntarenas.

Germany.—Telephotography.—A step forward is claimed to have been made in the speed of transmission and reception of writing and pictures by wireless. The announcement was made at Leipzig on the occasion of the unveiling of a monument to the German physicist Hertz by Dr. Schröter, of the Research Department of the Telefunken Gesellschaft, with whom Dr. Karolus, who is chiefly responsible for the improvements, has been collaborating.—*The Times.*

The Telegraph Conference.—Telephony.—A novelty in telephonic communication, adopted on October 30th at the closing meeting of the Paris International Telegraph Conference, is a system of "lightning" conversations, which will take absolute priority over all other calls. The rate chargeable will be approximately ten times the ordinary tariff. The system, which has already been applied in Scandinavia, will now be made general internationally, though its introduction is not obligatory, and is only applicable by mutual arrangement between the different countries.

Another innovation, accepted by the Conference, is the adoption of a rule that the time taken in excess of the first three minutes, in the case of international telephone calls, shall be charged "per minute" and not "per three minutes," as hitherto, a change which will mean a great saving to users of international telephones.

The Conference also adopted a new feature as regards wireless telegraphy, whereby wireless messages under multiple addresses will be accepted in plain or in code language.—*Reuter* (Paris).

Telegraphists' Strike.—Marconi Operators.—The following statement was issued on November 3rd by Marconi's Wireless Telegraph Co., Ltd.:—

On October 31st the management at Radio House gave notice to nine telegraphists whose services were no longer required. At 4 p.m. on November 3rd the whole of the telegraphic staff went on strike. The Marconi Co. has no official knowledge whether the strike was caused by the notices given to the nine men or not. During the morning of November 3rd the secretary of the men's union telephoned asking for an interview, as there was likely to be trouble with the Radio House telegraphists. He was told that if he wished to see the manager unofficially, to discuss any grievances the men might have, the manager would be glad to see him, but that any official representations must be made to the Engineering and Allied Employers' London and District Association. So far as the Marconi Co. is aware, no approach was made to the Federation, and the men came out on strike without any notice.

The Telephone Service.—New Automatic Exchanges.—The first towns in the South-West of England to have the automatic telephone system installed are Torquay and Paignton, where the change was made on Saturday. The formal opening ceremony took place on Monday, when the Mayor officially inaugurated the new system and inspected the plant at the head post office. The telephone kiosks in various parts of the two towns are to be provided with a new type of coin box, with slots for shillings and sixpences as well as pennies, thus allowing calls of any distance to be effected.

United States.—Government Radio Service.—The maze of wires formerly used by the Government has been supplanted by a network of radio stations manned by Army and Navy *personnel* and transmitting messages not only to the two military arms, but to other Government departments as well. About two million words in Government messages are radiated monthly from Washington, through Army and Navy stations. Until recently about half of the Government's messages were dispatched over commercial lines, and radio not only has expedited and effected economy in communication, but its wide use, says *T. & T. Age*, has served to train a large force and erect a system that would be highly valuable in the event of war. The Navy sends and receives an average of more than one million words monthly by radio, its own leased land wires, and through commercial companies. Of this, little more than one-fifth is now transmitted by private concerns, with radio handling the larger part. Development during the past year of short-wave sending has considerably increased the Navy's capacity for handling messages, and when the battle fleet was in the antipodes recently two-way short-wave communication was readily established with Washington. The War Department has established a net of 60 radio stations, and it undertook its first great expansion of the use of radio for departmental business at the beginning of the fiscal year 1923 and transmitted through its stations that year less than 4,000,000 words. In the fiscal year 1925, ending last July, nearly 8,500,000 words were transmitted.

Radio Notes.

Germany.—LICENCES.—A considerable reduction in the number of German broadcasting subscribers is announced, and according to *The Times*, the Post Office officials whose duty it is to collect the fees are urged to greater efforts, the official view being that the decrease is more probably due to "licence-fatigue" than to lack of interest in the broadcast programmes. Severer measures against the owners of unlicensed receiving sets are also hinted at. Proceedings against "black-hearers," as they are called in Germany, have always been a feature of German broadcasting, and periodic announcements are made of convictions, the appeals to the dilatory usually ending with a reminder of the smallness of the fee. It is at present 24 marks (£1 4s.) per annum.

Japan.—"DUMPING" TARIFF.—Manufacturers of the cheaper grades of wireless apparatus in the United States and Great Britain, particularly the former, are to find the Japanese market closed to them in the near future, if the plan of the Finance Department materialises, which the *Daily Mail* thinks is certain. This plan is to include all wireless materials and parts under the "luxury tariff" enacted a year ago, which imposes an import duty of 100 per cent. Recently American wireless material has been imported in great quantities. There are now 70,000 subscribers in Tokio to the broadcasting service, and it is expected that this number will be doubled by the end of the year.

Latvia.—NEW STATION.—The construction of the two towers for the radio broadcasting station at Riga has been completed, and it is expected that the station will be in operation shortly. *Commerce Reports* believes that the Latvian postal administration will not monopolise the future radio business in Latvia as originally planned.

Licences.—DEMAND CONTINUES.—The latest figures issued by the Post Office show that at the end of September 1,464,500 licences had been issued. This figure shows an increase of 41,500 over the figure for the end of August, which was 1,380,000. At the end of September, 1924, the number was 998,607.

New Studio.—OXFORD.—A new studio has been fitted up by the British Broadcasting Co., Ltd., in Magdalen Street, Oxford, and will be opened on November 26th. It is understood that it will be used for broadcasting events connected with Oxford and University life from time to time.

Peru.—LICENCES.—The Government of Peru is to enforce the provisions of the wireless law calling for the inspection of all radio installations and the collection of a tax of one Peruvian pound for each receiving set in use. The general administrator of mails, telegraphs, and wireless is intrusted with the assessment and collection of this tax, together with the establishment and maintenance of a registry of all sets in use.

United States.—RADIO ANTI-TRUST INQUIRY.—The United States Federal Trade Commission has begun hearings in New York in an investigation of the methods and practices of the Radio Corporation of America. According to the *Manchester Guardian*, Mr. David Sarnoff, vice-president and general manager of the Corporation, issued a statement the day before hearings commenced, in which he said that his company welcomed the investigation.

DELHI.—November 30th. Indian Stores Department. Sul station equipment for Jaipur (comprising insulators, wire, l. cable, switchgear, transformer, &c.).*

Kingston-upon-Hull.—November 16th. Electricity Depar ment. Two natural draught cooling towers. (October 30th

London.—LONDON COUNTY COUNCIL.—November 16t Reconstruction of electrical switchgear at Shoreditch sul station. (October 30th.)

New Zealand.—WELLINGTON.—December 15th. Post Offi Stores Department. Key switches.*

Oldham.—November 21st. Electricity Departmen Three 12,500-kW turbo-generators and auxiliary plan (October 30th.)

December 5th. Eight water-tube boilers, with superheater chain-grate stokers, steel chimneys, and induced draught plan (See this issue.)

Pentre (Glam.).—November 16th. Rhondda Urban Di trict Council Electricity Department. Two 35-h.p. and or 20-h.p., 400-V, squirrel-cage induction motors. (See th issue.)

Richmond (Yorks.).—Town Council. Electrical plan and material for electricity scheme. Specifications from M W. W. Foster, town clerk, Corporation Offices.

South Africa.—JOHANNESBURG.—December 4th. Electricit Supply Commission. Plant and material for transmission lin and sub-stations in connection with the supply of electricit in the Cape area rural districts.

December 23rd. Union Tender Board. Telephone apparatu and supply of telegraph material for the Department of Pos and Telegraphs.—*S.A. Mining and Engineering Journal.*

CAPE TOWN.—December 3rd. Electricity Departmen Three-phase induction voltage regulators.*

FORT BEAUFORT.—December 10th. Municipal Counci Generating plant and materials for electric lighting.*

QUEENSTOWN.—January 7th, 1926. Municipal Council. E tensions to the electricity undertaking.*

Uruguay.—MONTEVIDEO.—January 5th. State Electricit Supply Works. Bare copper wire, quicksilver.*

January 11th. 96,000 metres lead-covered wires and cables.

January 12th. 44,500 metallic and carbon-filament lamps

January 18th. 170,000 metres of r.i. cords.*

Administration Nacional del Puerto de Montevideo. Januar 2nd. Machine tools and equipment.*

West Ham.—November 16th. Education Committe Installation of electric lighting and central heating at th Cumberland Road new secondary school. (October 23rd.)

York.—November 12th. Electricity Department. Or 6,000-kW, 3-phase turbo-alternator, with condensing plan pipework, &c. (October 23rd.)

*Further particulars can be obtained at the Department Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.

Closed.

Barrow.—The Council has adopted the Electricity Com mittee's recommendation to purchase six sets of switchge from the Swedish General Electric, Ltd., at £13 10s. per se It was stated that the British firms quoted £40 per set, bu the Swedish apparatus was very much lighter than the Britis though efficient for the purpose required.

Belgium.—The Belgian Post and Telegraph authoritie in Brussels last week placed some large contracts for miscell neous telephone material with the Bell Telephone Manufa turing Co., the New Antwerp Telephone Co., of Antwerp, an the Société Electrique et Mecanique, of Brussels.

Birmingham.—Education Committee. Accepted:—
Installation of electric light in the Domestic Subjects Centre Harborne.—E. Hill & Sons.

Bradford-on-Avon.—Urban Council. Accepted:—
Installing electric light at the Baths.—Rossiter & Co.

Burnley.—Electricity Committee. Accepted:—
360 yds. of conduit (£123).—J. & R. Howie, Ltd.
2,025 yds. of cable (£1,001).—P. E. Bantling, Ltd.

Chesterfield.—Town Council. Accepted:—
Cable extensions.—W. T. Glover & Co., Ltd. (£379); Western Electr Co., Ltd. (£310).

Erith.—Urban Council. Accepted:—
Two lots of cable (£358 and £552 respectively).—Callender's Cable ar Construction Co., Ltd.

London.—ST. MARYLEBONE.—Electric Supply Committee Recommended:—
Two e.h.p. truck-type cubicles (£172).—Ferguson, Pailin, Ltd.

DEPTFORD.—Town Council. Accepted:—
Electrically-driven vertical centrifugal pump for Laurie Grove bat (£770).—Worthington, Simpson, Ltd.

Manchester.—Baths and Wash-houses Committee. Ac cepted:—
Installation of electric light at Mayfield baths.—R. H. Clampett & C

Education Committee. Accepted:—
Electric lighting installation, Longsight Municipal school.—R. Seddon an Sons.
Rearrangement of the electric lighting installation, Burgess Street scho —Ward & Booth.

Electricity Committee. Accepted:—
Cable troughing, capping and boards.—Burt, Boulton & Haywood, Ltd.; Hall Bros. Timber Co., Ltd.
One 10-ton hand-operated crane for Burnage sub-station.—H. Morris, Ltd.
Switchgear, Hetherington & Sons' sub-station.—Ferguson, Pailin, Ltd.

Gas Committee. Accepted:—
Overhauling and maintenance of telephone installation (Bradford Road).—L. E. Wilson & Co.

Morecambe.—Electricity Committee. Accepted:—
H.p. cable.—W. T. Glover & Co., Ltd.

Oldham.—Tramways Committee. Accepted:—
12 tramcars.—English Electric Co., Ltd.

Electricity Committee. Accepted:—
Meter boards.—C. Schofield & Co., Ltd.
Switchgear.—Ferguson, Pailin, Ltd.

Preston.—Corporation. Accepted:—
Supply of a third turbo-generator (£50,257) for the new Ribble power station.—English Electric Co., Ltd.

South Africa.—DURBAN.—Electricity Department. Accepted:—
3 miles cable (£2,435); 10 tons bare copper wire (£944); fuses (£187); stay rods (£71).—T. Barlow & Sons, Ltd.
6 miles cable (£2,327).—Bartle & Co., Ltd.
One automatic synchroniser (£164).—British Brown, Boveri, Ltd.—*S.A. Mining and Engineering Journal.*

SOUTH AFRICAN RAILWAYS.—*The Times* states that the Metropolitan-Vickers Electrical Co., Ltd., has secured a large repeat order, upwards of a quarter of a million pounds in value, for more combined passenger and freight locomotives with gears, similar to the 78 supplied by the company in 1922, and put into commission during the last two years, in connection with the electrification of the South African Railways.

Spain.—SPANISH ELECTRIFICATION CONTRACT.—The Santander-Bilbao Railway Co. has awarded the contract for the electrification of the line between Bilbao and Las Avenas to the Allgemeine Elektrizitäts Gesellschaft. Contracts for the motors and certain accessories remain to be awarded, and tenders will be invited very shortly.—*Reuter's Trade Service* (Madrid).

Stafford.—Electricity Committee. Accepted:—
Construction of circulating-water ducts.—Mitchell Conveyor and Transporter Co., Ltd.

Tynemouth.—Electricity Committee. Accepted:—
Wiring houses under assisted scheme.—J. E. Robinson.

Forthcoming Events.

Institution of Electrical Engineers.—INFORMAL MEETING.—Monday, November 9th. At the Institution, Victoria Embankment, W.C. At 7 p.m. Discussion on "Modern Developments of Telephone Cables," to be opened by Mr. E. S. Ritter.

(Irish Centre) (Dublin).—Thursday, November 12th. At Trinity College, Dublin. At 7.45 p.m. Paper on "Underground Telephone Construction," by Mr. G. G. Sutcliffe.

(North-Eastern Centre).—Monday, November 9th. At Armstrong College, Newcastle-on-Tyne. At 7 p.m. Paper on "Dielectric Problems in High-Voltage Cables," by Mr. P. Dunsheath.

(North-Midland Centre).—Tuesday, November 10th. At the Hotel Metropole, Leeds. At 7 p.m. Address by the chairman, Mr. S. Derwen Jones, and smoking concert.

(Scottish Centre).—Tuesday, November 10th. At the Royal Technical College, Glasgow. At 7.30 p.m. Address by the chairman, Prof. M. Maclean.

(South-Midland Centre).—Wednesday, November 11th. At the University, Birmingham. At 7 p.m. Paper on "The Development of Alloys of Nickel and Chromium for High-Temperature Work and Electrical Resistance Heating," by Mr. W. R. Barclay.

(Dundee Sub-Centre).—Thursday, November 12th. At the University College, Dundee. At 7.30 p.m. Paper, "A Comparison of Electrical Wiring Installations and Analysis of their Costs," by Mr. I. Sclar.

(North-Western Centre) (Students' Section).—Tuesday, November 10th. At Milton Hall, Deansgate, Manchester. At 7.30 p.m. Paper on "The Design of Current Transformers," by Mr. C. T. Melling.

(London Students' Section).—Friday, November 13th. At the Institution, Victoria Embankment, W.C. At 6.15 p.m. Opening address by Lt.-Col. K. Edgcumbe, R.E. (T.A.).

Nottingham Society of Engineers.—Monday, November 9th. At the Victoria Station Hotel. At 7.30 p.m. Lecture on "Automatic Machines," by Mr. L. Cord.

Association of Mining Electrical Engineers (London Branch).—Tuesday, November 10th. At the Engineers' Club, Coventry Street, W. At 6.30 p.m. Presidential address by Mr. J. W. Gibson.

Institution of Engineering Inspection.—Friday, November 13th. At the Royal Society of Arts, John Street, Adelphi, W.C. At 7.30 p.m. Paper on "Modern Developments in Steels Resistant to Corrosion," by Mr. W. H. Hatfield.

Junior Institution of Engineers.—Friday, November 13th. At 39, Victoria Street, S.W. At 7 p.m. Annual general meeting.

Birmingham Electric Club.—Friday, November 13th. At the Grand Hotel, Colmore Row. At 7 p.m. Lecture on "Submarine Cable Manufacture and Laying," by Mr. H. G. Wood.

Physical Society of London.—Friday, November 13th. At the Imperial College of Science, South Kensington, S.W. At 5 p.m. Ordinary scientific meeting.

Finsbury Technical College Old Students' Association.—Saturday, November 14th. At the Engineers' Club, Coventry Street, W. At 6.30 p.m. Annual dinner.

The "Electrical Review" Service Department.

ENQUIRIES must be accompanied by a stamped addressed envelope.

We should be glad to learn the names of makers or suppliers of:—

THEOLIGHT DYNAPOCKET lamps and cycle sets.

Notes.

Power Station Visit. — The Halifax Corporation power station was visited last week by some 200 employés of Messrs. John Crossley & Sons, Ltd., carpet manufacturers, of Dean Clough Mills. The party was divided into groups and conducted over the works by members of the staff, who explained details of the plant and its working. The visit was organised by the Dean Clough Mills Welfare Society, and hearty thanks were accorded the borough electrical engineer (Mr. W. M. Rogerson) and the members of the staff.

The 1926 Municipal Tramways Association Conference.—Liverpool City Council has invited the Municipal Tramways and Transport Association to hold its next annual conference in Liverpool.

Manchester Wireless Exhibition.—Over ninety firms exhibit in the second annual Manchester Wireless Exhibition (October 27th to Nov. 7th). The opening ceremony was performed by Capt. P. P. Eckersley, and the exhibits comprise everything from a cat's-whisker to a wireless-equipped lifeboat, the White Star Line having loaned a boat from the steamer *Baltic*. Messrs. Franks, Ltd., wireless dealers, of Manchester, have organised a £100 competition, by which they are seeking to discover the most popular types of loud speakers, receivers, and components. Another ballot competition was run by the exhibition authorities to determine which stands, in the opinion of the public, were the most interesting and attractive. The first prize was an eight-valve heterodyne receiver valued at £60, presented by Messrs. H. Clarke & Co., Ltd., Manchester; second prize, a two-valve amplifier and loud speaker valued at £30, presented by the Western Electric Co., Ltd., London; and the third prize, a Burndept Ethophone No. 3, valued at £25, presented by Mr. W. C. Barraclough, Manchester.

R.N.D. Engineers' Dinner.—The seventh annual dinner will be held on Friday, November 13th, at the London Tavern, 53, Fenchurch Street, E.C., at 6.30 p.m. for 7 p.m. On this occasion Nos. 1, 2 and 3, Field Companies, Signal Co. and Depôt Co. will dine together. Tickets (6s.) are obtainable from Mr. J. N. Robertson, 14, Woodgrange Avenue, Ealing Common, W.5. 'Phone: Ealing 2779.

London Electrical Engineers.—27th (London) Anti-Aircraft Battalion R.E. (T.A.). Officer Commanding: Lt.-Col. C. H. S. Evans, O.B.E.

The following orders have been issued for November:—

305th Company (Major A. W. M. Mawby, O.B.E., A.M.I.E.E.).—Tuesdays, 7 p.m. to 9.30 p.m.: Special instruction for officers, non-commissioned officers, and men for promotion.

306th Company (Major F. C. Clarke, A.M.I.E.E.).—Mondays, 7 p.m. to 9.30 p.m.: Special instruction for officers, non-commissioned officers, and men for promotion.

The headquarters at 46, Regency Street, London, S.W.1, will be open until 8 p.m. on week-days (11 p.m. on Mondays and Tuesdays), and 1 p.m. on Saturdays. All social arrangements for the year will be under Major W. H. Merrett, T.D., and the sports officer is 2nd-Lieut. T. H. R. H. Jolly.

Appointments Vacant.—Junior mains engineer for the Electricity Supply Department of Pooley Hall Colliery. Station superintendent and constructional draughtsman for the City and County of Bristol Electricity Department. Travelling meter inspectors for the Electrical Apparatus Co., Ltd. Plumber-jointer for the Hazel Grove and Bramhall U.D.C. Electricity Department. (See our advertisement pages to-day.)

Earthing the Neutral.—Referring to the efforts of wireless amateurs to operate their sets with current from the mains, Mr. James Nelson writes pointing out that it is forbidden by the electricity regulations to earth the neutral of a system at more than one point, and that persons trying to charge accumulators by connecting a battery between the earthed main and, for instance, a water pipe, would render themselves liable to prosecution. The lighting mains, when used in conjunction with a wireless set, should never be earthed except through a condenser robust enough to withstand the full voltage of the supply to earth.

An Institute of Wireless Engineers.—A meeting was held at the Hotel Russell, London, on October 31st, for the purpose of considering the formation of an institution to cater for the wireless engineer.

Mr. C. E. Baldwin presided, and said the object of those who started this movement was to co-operate with the existing institutions, and at the same time do work which was not done by them.

Mr. W. Y. P. Evans, of Manchester, who has been acting as secretary, regretted that the Institution of Electrical Engineers found it impossible to state a definite policy with regard to the aims of those who were behind this movement. One of the difficulties of the Institution of Electrical Engineers was that it obviously could not reduce the status which it had already established for those desiring to become members, and the result was that although the I.E.E. catered for the advanced wireless engineer, it did not encourage the junior or regularly employed wireless engineer. A certain section of wireless engineers

were not particularly keen on joining the I.E.E. because by doing so they became chartered electrical engineers—which they did not desire to be. On the other hand, Mr. Evans continued, the Radio Society had acted in a very straightforward manner by stating that its policy was to cater only for the amateur. Thus, there was a gap between the work which the Radio Society of Great Britain was doing and that which the Institution of Electrical Engineers did through its Wireless Section.

The chairman, in the course of subsequent remarks, stated that as the result of correspondence with wireless engineers all over the world, 50 had already expressed a wish to join some institution for wireless engineers, and contributions had actually been sent in amounting to £216. The fact that there were something like 500 members of the American Institute of Radio Engineers in this country indicated that there was ample room for a body such as that now proposed.

Mr. Evans said that one of the things which it was felt ought to be remedied was that a man in charge of a 10-kW Government station was considered merely as an operator and not as a wireless engineer. One of the tasks of the new body, if formed, would be to deal with such matters and endeavour to raise the status of such men by giving some hall-mark to their abilities. The people whom it was desired to bring together consisted, for the most part, of men who were really debarred from joining the Institution of Electrical Engineers.

A resolution was unanimously passed that a new body should be formed, and it was decided to call it the Institute of Wireless Engineers. A committee was formed to carry out the necessary preliminary work with a view to the preparation of the articles of association, Mr. W. Y. P. Evans, of 2, Parkside Road, Princes Road, Moss Side, Manchester, being elected secretary. It is the intention to have the headquarters of the Institute in London.

The Birmingham Electric Club.—The ladies' night of this club, held on October 23rd, at the Grand Hotel, Colmore Row, Birmingham, was very successful, about 450 persons being present. This being the 21st anniversary of the club, a special feature was made of the electrical decorations, which included electrically-illuminated signs reading: "1904-1925." The Grosvenor ballroom was tastefully garlanded with smilax, palms, and chrysanthemums, and whilst dancing proceeded to the strains of Messrs. Priestley's Band, coloured lights were played upon the dancers from the balconies. A whist drive was patronised by a number of guests until 10 p.m., when there was one hour's interval for supper, during which speeches of welcome were delivered by the President, Mr. F. R. Unwin, M.I.E.E., to Mr. W. Smith, and Mr. E. A. Morgan, two of the founders of the club, and also to Mr. R. A. Chattock, city electrical engineer, congratulating him on his election as president of the Institution of Electrical Engineers. After supper dancing was resumed until 2 a.m., when the company surrounded the President and Mrs. Unwin and with joined hands sang "Auld Lang Syne."

Tyne Electrical Engineers' Dinner.—The officers of the Tyne Electrical Engineers, R.E., held their annual re-union dinner at Newcastle-on-Tyne, on Saturday, October 24th. The gathering was well attended by past and present officers of the unit, who spent a very enjoyable evening. Following the loyal toast, Lt.-Col. A. K. Tasker proposed the health of the Tyne Electrical Engineers. The commanding officer, Brevet-Col. Ernest Robinson, C.B.E., replied, and outlined briefly the present activities of the unit. He mentioned that a very satisfactory report had been made by the inspecting officers of the last camp. With regard to the successes obtained this year at the Northumberland Rifle Association meeting, the Tyne Electrical Engineers had won over 30 per cent. of the prize money. The unit had also carried away 16 of the 44 medals awarded, and three of the 10 challenge cups. The coveted Chipchase Cup had again, for the sixth time in succession, been won by a member of the Tyne Electrical Engineers, which had the distinction of possessing the competitor who had made the highest aggregate score. Since the last re-union dinner two challenge cups in respect of technical work had been presented for annual competition amongst the sections of the unit. Major Forster proposed the health of the retired and attached officers. Replying on behalf of the retired officers, Lt.-Col. S. E. Monkhouse said it was with very much pride that they watched the achievements of the Tyne Electrical Engineers, and he hoped it would not be long before the authorities recognised their efforts by granting them a larger establishment. Major N. H. Firmin, O.B.E., proposed a toast to Col. Robinson, and said it was a great honour to the Tyne Electrical Engineers that the C.O. should have had the C.B.E. conferred upon him. Replying to the toast, Col. Robinson said it was to him a source of very much regret that he would no longer remain on the strength of the unit.

Fatalities.—W. J. Wainwright (27), an electrician employed at the Barugh works of the Yorkshire Electric Power Co., was killed recently in the works at a switch which he had been repairing. It appears that after effecting the repairs he asked the charge engineer to switch on. The engineer received the signal that everything was right and put on the current. On receiving no reply he went to see whether anything was wrong, and found Wainwright lying near the switch, face downwards. Artificial respiration was tried without success.

An inquest was held at Hayle (Cornwall) last week into th death of Richard James, an overhead linesman in the employ ment of the Cornwall Electric Power Co. It was stated tha James, in company with two other linesmen, was examinin the line through Hayle to Camborne for a cracked insulato when James fell from the telephone arm of a pole, a distanc of 21 ft., fracturing his skull. William Wills, the foreman said that James could not have got in contact with a liv wire, and he could only account for his fall by seizure wit sudden illness. Evidence was given by Mr. A. C. Owen, Camborne, distribution engineer to the Electric Power Co and a doctor testified to the fact that there was no evidenc that deceased had received an electric shock. The Corone returned a verdict of "Accidental death."

London Traffic Inquiry.—The inquiry by a sub-committe of the London Traffic Advisory Committee into the traff facilities of North London was re-opened on November 2nd A report was submitted by Mr. J. K. Bruce, general manage of the L.C.C. tramway undertaking, giving details of th tramway service at Finsbury Park tube station. The inquir is to be resumed to-day.

Institution Notes.

Institution of Electrical Engineers.—South-Midland Students' Section.—At the meeting on Tuesday last, a pape was to be read by Mr. J. T. Allen on "A Study of the Diffi culties in the Application of Electricity to Farming."

Programmes.—The arrangements for the first part of th 1925-26 session include the following provincial items:—

Irish Centre (Dublin).

November 12th.—Mr. G. G. Sutcliffe. "Underground Telephone Con struction."

December 10th.—Mr. J. Lindsay. Lecture on "The Mechanical Winnin of Peat."

January 21st, 1926.—Mr. A. P. Trotter, B.A. Faraday Lecture on "Illu mination and Light."

Mersey and North Wales (Liverpool) Centre.

November 16th.—Mr. T. Carter. "The Engineer: His Due and His Dut in Life."

December 14th.—Mr. E. H. Shaughnessy, O.B.E. "Post Office Wireles Stations."

January 18th, 1926.—Mr. A. P. Trotter. Faraday Lecture on "Illumina tion and Light."

North-Eastern Centre.

November 9th.—Mr. P. Dunsheath. "Dielectric Problems in High-Voltag Cables."

November 23rd.—Mr. T. Carter. "The Engineer: His Due and His Dut in Life."

December 14th.—Lt.-Col. K. G. Maxwell and Mr. A. Monkhouse. "Re cent Improvements in the Insulation of Electrical Machinery."

South-Midland Centre.

November 10th.—Mr. S. Derwen Jones. Chairman's address (followed b a smoking concert).

November 24th.—Mr. T. Carter. "The Engineer: His Due and His Dut in Life."

December 8th.—Prof. S. P. Smith. "An All-Electric House."

North-Western Centre.

November 17th.—Mr. P. Dunsheath. "Dielectric Problems in High-Voltag Cables."

December 1st.—Mr. T. Carter. "The Engineer: His Due and His Dut in Life."

December 15th.—Prof. S. P. Smith. "An All-Electric House."

January 19th, 1926.—Mr. A. P. Trotter. Faraday Lecture on "Illumina tion and Light."

Sheffield Sub-Centre.—The opening meeting and smoking concert of the season of the Sheffield Sub-Centre of the Institution was held last week, when Mr. W. F. Mylan was installed as chairman. In his speech, Mr. Mylan made a strong appeal for increased membership; in 1921 the Sub-Centre had a membership of 73, which had increased to 167, but there still remained many electrical engineers in the district who were not members of the Institution. The membership of the Students' Section had increased in five years from 36 to 52.

Scottish Centre.—The 25th annual report of the Committee of this Centre shows that 10 meetings were held during the 1924-25 session at which the average attendance was 75, and the session ended with a total membership of 652, a decrease of six as compared with the previous year. The two informal meetings held in Glasgow were very successful.

Scottish Students' Section.—The seven meetings and five works visits of this Section were considerably in excess of those of past years, and it is hoped to develop this Section in the future. The average attendance at meetings was 32.

Dundee Sub-Centre.—The attendance at the six meetings of this Sub-Centre averaged 24; the membership at the close of the session totalled 59.

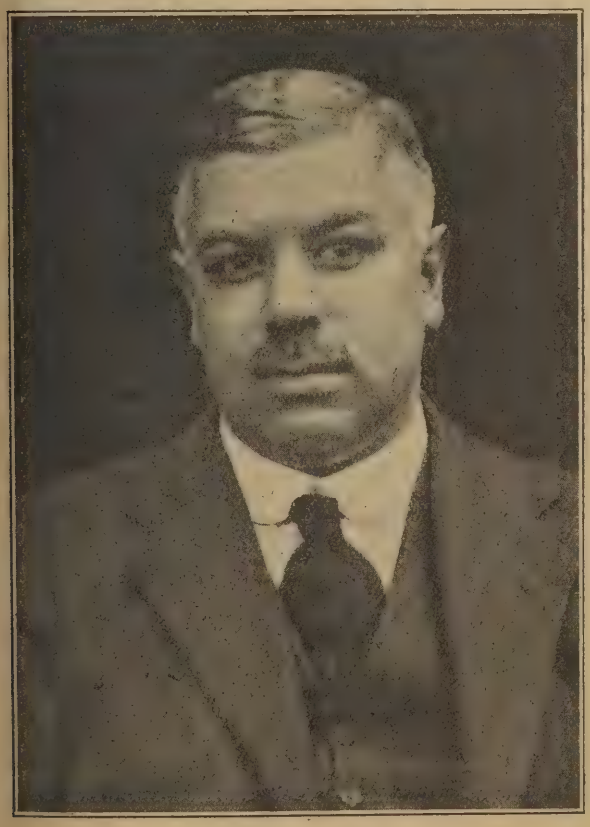
Electrical Society of Glasgow.—The following are the arrangements for the 1925-26 sessions:—

December 1st.—"Wiring Systems." Mr. T. S. Seymour.
January 6th.—"Wiring Rules and Defects." Mr. H. M. Stronach.
February 2nd.—"Internal Combustion Engines." Mr. A. H. Crowther.
March 2nd.—"Industrial Heating Appliances." Mr. P. J. Sims.

Royal Institution.—At a general meeting on Monday last, the special thanks of the members were returned to Professor Percy Frankland for his gift of a number of relics of Faraday.

Institution of Heating and Ventilating Engineers (Inc.).—At the meeting on November 4th, Mr. J. J. Lassen dealt with the installation of heating plant, pointing out that some kind of instrument should be available to enable the attendant to watch the firing. When examining the performance

any heat-producing plant in detail, a proper heat balance set must be compiled in order to ascertain the efficiency of the plant. Carbon dioxide recording instruments were formerly constructed far too much by chemists, who did not fully realise the rough working conditions in the average workshop; but with modern plants far greater attention had been paid to the mechanical details so that they now had instruments which would stand years of hard work.

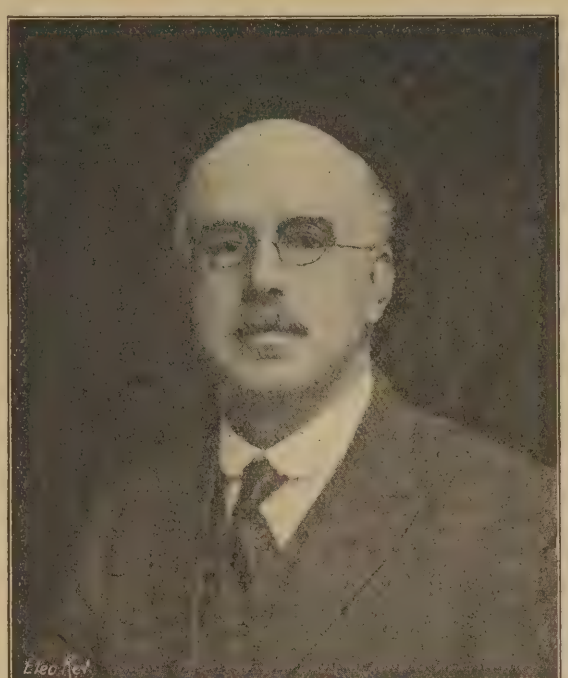


Junior Institution of Engineers.—At a meeting of the Institution held on October 30th, a film was shown illustrating the construction and assembly of the 50,000-kW turbo-alternator recently supplied by Messrs. C. A. Parsons & Co., Ltd., for the power station of the Commonwealth Edison Company of Chicago. Mr. G. S. Prest made some preliminary remarks on the features of the design of the machine, and summarised the improvements over existing practice which were expected to be obtained. There was a record attendance of members and visitors.

Institute of Transport.—ELECTRIC TROLLEY 'BUSES.—Mr. Frank Ayton, in his recent paper before the Institute, at Liverpool, urged the points of superiority of the electric trolley 'bus over the petrol motor 'bus. "The running cost per mile of the trolley 'bus is," he said, "1.46d., as opposed to 2.47d. for the petrol 'bus. Trolley 'buses can easily be employed for carrying goods and for handling such a transport service from town to town if necessary."

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.)



The accompanying portrait is of Mr. W. F. MYLAN, who is Chairman of the Sheffield Sub-Centre of the Institution of Electrical Engineers. Mr. Mylan was born in Edinburgh in 1881; he was educated privately and at the University College, Sheffield. In 1903 he joined the Sheffield staff of the British Westinghouse Co., and was then for a time engaged on testing for the company at Trafford Park. He returned to Sheffield in 1906 and shortly afterwards was appointed district manager. Mr. Mylan held this position until 1919, when with Mr. G. H. Smith, who was also with the British Westinghouse Co., he formed a company under the title of Mylan & Smith (Engineers), Ltd. Mr. Mylan's connection with the Institution has been a long one and he took an active part in the formation of the Sheffield Sub-Centre. From its inception he acted as treasurer until he relinquished this task to become chairman. Mr. Mylan was a footballer for many years, but his spare-time energy is now employed in golf and tennis. During the war he was an officer in the Yorks. and Lancs. Volunteers.

Mr. W. F. Mylan,
Chairman of the Sheffield Sub-Centre of the I.E.E.

Mr. W. HAMMOND SMITH has recently joined the staff of Messrs. H. J. Packer, Ltd., Bristol, as chief engineer.

Mr. S. DERWEN JONES, whose portrait accompanies this note, is chairman of the North Midland Centre of the Institution of Electrical Engineers for the current session. He was born in Manchester in 1866, and after working in several steam engineering works and tool shops, he studied electrical and mechanical engineering at the Manchester Municipal Technical School. One of his first jobs was the erection and starting of its first a.c.-d.c. battery sub-station for the Salford Corporation. Later Mr. Derwen Jones entered the service of the Bristol Tramway Co., Ltd., as assistant engineer, and from there he went to Doncaster as chief assistant electrical engineer during the period of the inauguration of the town's electric tramways. He was then appointed borough electrical engineer of Batley, a position which he still holds. In the course of his service with the Batley Corporation he has been solely responsible for a number of extensions, including the installation of a 3-phase system.

Mark E. Mitchell & Co. [*Harrogate*

Mr. S. Derwen Jones,
Chairman, North Midland Centre, I.E.E.

Mr. H. E. YERBURY, deputy manager of the Sheffield Electric Supply Department, at his installation last week as President of the Sheffield and District Section of the Junior Institution of Engineers, gave an address on "The Application of Metaphysics to Science and Engineering."

Mr. E. G. BEATON, acting electrical station engineer at Devonport dockyard, is replacing Mr. J. S. P. Willcocks, serving in a similar capacity at Portsmouth dockyard, he having been transferred to Devonport.

We regret to learn from the newspaper Press that Sir J. S. HARMOOD BANNER, Bt., is lying seriously ill at his residence, Ingmire Hall, Sedbergh, having had a relapse.

Mr. EDWARD D. KILBURN, Vice-President and General Manager of the Westinghouse Electric International Co., and Mr. WALTER S. RUGG, General Sales Manager of the Westinghouse Electric and Manufacturing Co., were named vice-presidents of the latter company at a recent meeting of the board of directors in New York.

Mr. D. E. BELL, general manager and engineer of the West Riding Electric Tramways Co., Ltd., has accepted the appointment of manager to the St. Helens Corporation tramways.

Mr. W. M. CITRINE, who has been appointed acting secretary of the Trades Union Congress, is an electrician by trade and for many years was district secretary of the E.T.U., at Liverpool.

Writing in one of the Leicester papers, Mr. H. PARSONS, managing director of Messrs. Gent & Co., Faraday Works, Leicester, mentions that some of the staff who assisted Mr. J. T. Gent in his telephonic experiments fifty years ago are still with the firm, as is also the assistant who actually made the telephonic apparatus for the Leicester Thorpe Street experiment in 1877. Mr. J. T. Gent first introduced electric light to Leicester with an arc light, on the grand stand of what is now known as Victoria Park, in 1882, the occasion being the visit of the Prince and Princess of Wales to Leicester.

Mr. R. C. BULLOUGH, for 21 years manager of the Colchester Tramways, has been presented with a gold albert by the employés on his retirement from the position.

Mr. ARTHUR FODEN has been appointed shift engineer by the Southport Town Council.

On the evening of October 27th, at the Grand Hotel, Birmingham, a complimentary staff dinner was given to Mr. R. A. CHATTOCK, M.I.E.E., city electrical engineer, to commemorate his election as President of the Institution of Electrical Engineers. Those present included the Lord Mayor of Birmingham, the Town Clerk, Sir David Brooks, Councillor

Beale, chairman of the Electric Supply Committee, Alderman Burman, M.P., Alderman Jephcott, M.P., and other members of the Electric Supply Committee, and over 160 members of the staff, including ladies. The secretary of the department, Mr. E. J. Jennings, Assoc. I.E.E., who was in the chair, referred to the remarkable growth of the department and said that they were out to give a great public service at as low a cost as possible. He referred to the output and other records which were constantly being broken, and he paid a tribute to Mr. Chattock as a distinguished electrical engineer, as a departmental administrator, and as an impartial and tactful chief. Mr. Frank Forrest, M.I.E.E., M.I.M.E., chief assistant electrical engineer, who proposed the toast "Our Guest," said that it was a source of great pride to all engaged in electrical undertakings, particularly on the municipal side, to know that the great Institution of Electrical Engineers, with its 12,000 members, had come to Birmingham this year for its president. The Lord Mayor of Birmingham, in supporting the toast, spoke most appreciatively of Mr. Chattock's work in Birmingham, and gave statistics showing the continuous and abnormal growth of the undertaking under his guidance. Since 1903, when Mr. Chattock came to Birmingham, the gross revenue had increased from £67,278 to £1,250,000; the number of 60-watt lamps connected from 84,193 to 721,337; h.p. of motors connected from 1,175 to 216,558; capital expenditure from £588,323 to £5,621,657. During the same period £2,166,386 of borrowed capital had been repaid. He said they were proud to think that Birmingham had been honoured by sending the first municipal electrical engineer to act as President of the Institution of Electrical Engineers. Councillor Beale said that he did not think anyone had seen a greater development in a municipal trading department than had taken place in the Birmingham Electric Supply Department. Mr. Chattock had, by his exertions, erected a monument for himself which few electrical engineers could equal. He designed and carried out the Summer Lane generating station; he designed the Nechells station, and the Committee hoped that he would design and carry out the super-station at Hams Hall. The toast was received with musical honours, and Mr. Chattock, in reply, expressed his appreciation of the loyalty and co-operation of the staff. He valued the cordial relations existing between the Committee, management, staff and workmen. He fully recognised that no one could enjoy life unless he enjoyed his work. There had never been any deficit in the undertaking, despite the advance in capital outlay, and he did not think there would be, as the position of the department was now stronger than it ever had been. During the evening musical interludes were provided by members of the staff.

Obituary.—MR. E. PRICE.—The death occurred on October 25th, at the age of 74 years, of Mr. Edward Price, who was the first engineer-manager of the Portsmouth municipal electric lighting undertaking, a position he held from 1891 until his retirement in 1903.

MR. H. F. FOSTER.—The death is announced of Mr. H. F. Foster, who was for a number of years electrical engineer to the Epsom Urban Council, and subsequently went into business for himself.

SIGNOR A. NETTI.—The death recently occurred in Rome at the age of 56 years of Signor Aldo Netti, a well-known electrical engineer who was associated with many of the large electricity undertakings in Italy.

New Companies Registered.

Oco Electrical Appliances, Ltd. (209,246).—Private company. Registered October 26th. Capital, £3,000 in 2,000 ordinary shares of £1 each and 20,000 deferred shares of 1s. each. Objects: To carry on the business of electricians, mechanical engineers and manufacturers, &c. The first directors are:—T. Halliday, 181, Rochdale Road, Oldham (director of T. Halliday, Ltd.); S. H. Johnson, 35, Brunswick Square, W.C., manufacturers' agent; W. H. Back, "Woodbury," 6, Maple Road, Leytonstone. Qualification, 1 ordinary share. Remuneration as fixed by the company. Solicitor: J. Wurzal, 68, Albion Street, Leeds. Registered office: Palace House, 128-132, Shaftesbury Avenue, W.1.

Robert J. Kidd & Co., Ltd. (209,255).—Private company. Registered October 26th. Capital, £1,000 in £1 shares (500 6 per cent. cumulative preference, free of income tax, and 500 ordinary). Objects: To acquire the business of X-ray specialists, and to give or assist in giving under medical supervision X-ray treatment in connection with maladies and diseases of all kinds, &c. The first directors are:—R. J. Kidd (permanent managing director), 5, Mabel Avenue, Great Lever, Bolton; W. A. Rowntree, 359, Green Lane, Bolton. Qualification, £200 shares. Remuneration, £12 each per annum.

British Resistor Co., Ltd. (209,287).—Private company. Registered October 28th. Capital, £1,000 in £1 shares. Objects: To act as representatives or agents for British or other firms in the electrical engineering and allied trades in connection with trade in the British and Colonial and other markets, to carry on business as mechanical, electrical, motor, agricultural, mining, metallurgical, chemical, railway and general engineers, merchants, factors, manufacturers, importers, and exporters of electrical and other machinery, &c. The permanent directors are:—A. Imbery, 14, St. Albans Avenue, Skircoat, Halifax, electrical engineer (managing director); D. Jones, 123, Parkinson Lane, Halifax, insurance inspector; A. Dobson, address not stated. Qualification, £100. Remuneration of directors (except managing director), £25 each per annum. Solicitors: A. Bastide, Elland and Briggate, Brighouse.

Foolprufe Patent Accumulator Co., Ltd. (209,216).—Private company. Registered October 24th. Capital, £1,000 in £1 shares. Objects: To carry on the business of designers, inventors, patentees, manufacturers and merchants of, agents for and dealers in accumulators, lamps, batteries, dynamos, magnetos, motors, power, heating and lighting plant and machinery, &c. The permanent directors are:—W. A. Millington, address not stated; E. A. Millington, Uplands, Lubenham Road, Market Harborough, coal merchant; G. F. Judd, Ashley, near Market Harborough, battery engineer. Secretary: J. Lees Smith, 32, The Square, Market Harborough. Solicitor: C. J. Crowther, 23, Abingdon Street, Westminster, S.W.

Cook-oo Manufacturing Co., Ltd. (209,286).—Privat company. Registered October 28th. Capital, £100 in £1 shares. Objects: T carry on the business of manufacturers of loud speakers for wireless apparatu and all of such parts and accessories in connection therewith, manufacture of and dealers in metals and minerals, electricians, engineers, &c. Th directors are:—E. A. Ellis, 10, Deauville Court, Clapham Park, S.W., gentleman; Mrs. F. Cooke, 8, Russell Road, Moseley, Birmingham. Solicitors A. T. Parker & Co., 105, Colmore Row, Birmingham. Registered office Heath Works, Heathfield Road, Kings Heath, Birmingham.

Official Returns of Electrical Companies.

Euradic Electric Co., Ltd.—Particulars filed of £1,00 debentures authorised October 15th, 1925, charged on the company's property present and future, including uncalled capital, the amount of the present issu being £300.

Belgravia Electrical Co., Ltd.—Debenture dated Octobe 20th, 1925, to secure £500, charged on the company's undertaking and pro perty, including uncalled capital. Holder: A. J. Marquand, 180, Albany Road Roath, Cardiff.

Efandem Co., Ltd.—Satisfaction in full on October 10th 1925, of debentures dated September 1st, 1914, securing £12,000.

National Signs, Ltd.—Satisfaction in full on Septembe 14th, 1925, of debenture dated December 18th, 1924, and mortgage date January 7th, 1925, securing £2,000.

Electro Pocket Cinemas, Ltd. — H. Chapman, of 171 High Street, Lowestoft, accountant, was appointed receiver on October 23rd under powers contained in debenture dated February 24th, 1925.

Lancaster and District Tramways Co., Ltd.—T. Atkinson, of 2a, Euston Road, Morecambe, was appointed receiver on October 7th 1925, under powers contained in mortgage debenture dated March 30th, 1900.

Imperial Tramways Co., Ltd. (58,981).—Return dated April 4th (filed August 28th), 1925. Capital, £400,000 in 20,000 preference and 20,000 ordinary shares of £10 each. All shares taken up. £100,000 paid on 10,000 preference. £300,000 considered as paid on the remainder. Mortgages and charges, £300,000.

Guy V. Laycock, Ltd. (173,770). — Return dated June 19th, 1925. Capital, £10,000 in £1 shares. 5,200 shares taken up. £1,200 paid. £4,000 considered as paid. Mortgages and charges, nil.

International Electric Co., Ltd. (113,906).—Return dated September 23rd, 1925. Capital, £51,000 in 31,000 ordinary and 20,000 preference shares of £1 each. 30,100 ordinary and 5,388 preference shares taken up. £32,488 paid on 27,100 ordinary and 5,388 preference shares. £3,000 considered as paid on 3,000 ordinary shares. Mortgages and charges, £70,500.

New Development Co., Ltd. (112,145). — Return dated July 14th, 1925. Capital, £5,000 in £1 shares. 1,275 shares taken up. £1,275 paid. Mortgages and charges, nil.

Young, Osmond & Young, Ltd.—Mortgage on 28, Broadway, Bexley Heath, Kent, dated October 20th, 1925, to secure £1,500. Holder: H. G. Weaver, 170, Coldharbour Road, Redland, Bristol.

Receptors, Ltd.—Issue on October 26th, 1925, of £700 debentures, part of a series already registered.

City Notes.

Reports and Meetings of Electrical Companies; Dividend Results, &c.

Montevideo Telephone Co., Ltd.

The annual meeting was held under the chairmanship of Viscount St. Davids on October 26th. In presenting the report and accounts (*vide* ELEC. REV., October 23rd, p. 669) the chairman said that the position of the company had gradually improved since the serious strike of 1922 and the subsequent legislation by the Uruguayan Government, which had reduced the dividend from 8 per cent., free of tax, to 5 per cent., less tax. During the past year the increase of business had necessitated a somewhat heavy capital expenditure; a number of new junction lines between the city and the "camp" had been built. Their investments had increased and the value of investments had appreciated. The gross revenue had increased by £11,000, and notwithstanding increased expenses in Montevideo, the decreases in other directions had raised the profit balance from £22,600 to £32,800. This enabled the directors to increase the dividend from 5 to 7 per cent. and to transfer a larger amount to reserve. The chairman concluded by paying a tribute to the work of the manager and his staff.

North Wales Power Co., Ltd.

Mr. K. M. Clark (chairman) presided at the annual meeting, on October 28th, and in the course of his speech said that there had been a satisfactory profit on the past year's working. After the deduction of debenture and loan interest and the addition of the sum brought forward, there remained an available balance of £20,205, out of which the full 8 per cent. was being paid on the preference shares, leaving £3,218 to be carried forward. The increase in the sales had been maintained; in 1924 the figure was 50 per cent. above that of the preceding year. Supplies were being afforded to most large towns on the coast, and it was expected that the supply to the Crewe works of the L.M.S. Railway would be commenced in a few weeks. Arrangements were also in hand and nearing completion by which supplies would be given to practically all the large centres of North Wales and South Cheshire which were at present without electricity. Most of the transmission lines had been completed and the remainder of the work was in progress. A double circuit h.p. transmission line had been erected between Crewe and the Mersey Power Co.'s works at Runcorn by which that station would

j the near future be linked up with the company's system. A important part of the scheme was the building of a new ad important water-power station at Maentwrog, Merionethsire. The contractors were actively engaged upon the work ed the foundations of the main dam had reached river level. Difficulties had been encountered owing to the rock formaon. Three smaller dams were also being constructed. The ute of the pipe line and conduit had been settled and work ad begun on two tunnels. Every endeavour was being made shorten the unproductive construction period, and when e work was finished it would benefit both the inhabitants of e district and the shareholders.

International Light and Power Co., Ltd.

The annual meeting was held on October 26th. Sir F. M. Voules, who presided, said that the company's ability to pay off so much of the preference dividend arrears was sufficient proof of its recovery after a period depression. The foreign exchange position was steady and the case of Brazil an improvement was shown. The reently-acquired undertaking of the South Brazilian Railways ompany was now yielding net revenue at the rate of £20,000 r annum, which was £7,000 in excess of all fixed charges curred in connection with the purchase. Certain improvements and extensions were being made. He was hopeful that e beneficial influence of the new President of the Mexican epublic would result in a return to prosperity of the Electric ght & Power Co. The unbroken record of growth and osperity had been continued by the Caracas undertaking, ad the electricity and tramway undertaking in Parana was eadily increasing its business.

Lisbon Electric Tramways, Ltd.

The annual meeting was held on October 28th, Mr. L. Breitmeyer presiding. In moving the adoption of the report and accounts (*vide* our last issue, p. 707) the hairman said that the affairs of the company showed conued improvement. The new arrangements under which the mpany was working were far more advantageous and would ve the company an opportunity of doing justice to the longffering shareholders. Although the number of passengers rried had been lower, there was an increase in the receipts. fter a long period it had been possible to pay off some of the rears of preference dividend, and he (the chairman) trusted at the company would be able to continue on the same road. was the intention of the company to pay the preference ividends as they fell due and to clear off the remainder of e arrears as soon as possible to enable the ordinary shareolders to receive some return on their holdings. Mr. Breitmeyer concluded his speech with a tribute to the services of e Lisbon local board and the general manager and his staff.

Aluminium Corporation, Ltd.

The report for the year ended December 31st, 1924, records a profit of £73,227, and after deducting debenture, &c., interest, and adding £6,323 from the last account, there is an available balance of £23,990, hich it is proposed to carry forward, although the amount sufficient to cover the payment of a preference dividend. he value of the company's lands, water rights and other ssets, has been appreciated by £60,035 in the balance sheet nd certain items in that account have been written off. The aluation is still below that placed upon the assets by surveyors engaged by the company. A joint of the new pipe line t Dalgarrog ruptured in November last, but the work of aking good the damage, the reconstruction of the pipe line, nd the completion of the low level dam and leet, together ith the new power house, has been completed, and the new achines were put into commission at the end of September. Work has also been commenced on a tunnel connecting Eigiau nd Cowlyd Lakes, which will greatly improve the Corporaion's storage facilities. The meeting was to be held on Wednesday last.

Erinoid, Ltd.

Presiding at the annual meeting on October 27th, the chairman (Mr. A. Binnie) said that the balance sheet submitted was the best since the formation of the company in 915. The profits had risen from £27,000 in 1924 to £49,000 ast year due to increased sales. The progressive increase was lue to the company's concentration on the production of the aw material, leaving other firms to work it into articles. The ulk of the sales were in England, but the company had a ood market in Central Europe in spite of severe competition. The French market was supplied by the French company, aided by a high import duty. The French company was in a prosperous condition and enjoyed a high reputation in France. The dividend which was being paid was well within the company's means and the cash reserves were maintained. It was intended to clear off the whole of the debenture debt as soon as possible.

Prospectus.

Gretna and District Electricity Supply Co., Ltd.—This company, which is being formed for the purpose of supplying electricity for public and private use within the counties of Dumfries and Cumberland, has issued a prospectus. The company has a nominal capital of £15,000, divided into 15,000 shares of £1 each, the whole of which is offered for subscription. It is proposed that the company should enter into an agreement with the Government to purchase the existing electricity plant at Gretna for £6,204. The provisional committee includes Mr. J. S. Wise, electrical engineer, 86, The Rand, Eastriggs. Mr. James Hutcheon, solicitor, 58, Annan Road, Gretna, is secretary.

Stock Exchange Notices.—Dealings in the following have been specially allowed by the Committee under Rule 159 :—

Pettigrew & Merriman (1925).—125,000 7½ per cent. cumulative preference shares of £1 each, 10s. paid, Nos. 1 to 125,000.

Electrical Distribution of Yorkshire.—250,000 new ordinary shares of £1 each, issued at £1 6s. per share, partly paid and fully paid, Nos. 250,001 to 500,000.

Application has been made to the Committee to allow the following to be officially quoted :—

Madras Electric Supply Corporation.—250,000 5½ per cent. preference shares (free of income tax) of £1 each, fully paid, Nos. 53,201 to 303,200 (cumulative).

Singapore Traction Co.—93,739 ordinary shares of £1 each, fully paid, Nos. 1 to 93,739; and 152,890 7 per cent. cumulative preference shares of £1 each, fully paid, Nos. 1 to 152,890.

Southern Brazil Electric Co., Ltd.—A loss of £20,861 was incurred during the past year, representing mainly debenture interest charged in the accounts but paid after the close of the year. The interest payments are now only six months in arrear, and the debt due to the Inland Revenue has been reduced by £10,000. The earnings of the company's subsidiaries showed a satisfactory increase, but certain capital expenditure has to be incurred in conformity with the terms of concessions. During the current year the progress has been maintained. The meeting was to be held on Wednesday last.

Mann, Egerton & Co., Ltd.—A meeting was to be held on Tuesday last for the purpose of considering proposals to reduce the company's capital from £400,000 to £370,925 by cancelling 9s. per share; and to pay off arrears on the 8 per cent. preference shares from January 1st, 1922, to September 30th, 1924, by the issue of 6 per cent. funding certificates, the dividend on the preference shares to be cumulative only as to 6 per cent.

Alabama Traction, Light and Power Co., Ltd.—The proposal to exchange the company's 5 per cent. first mortgage 50-year gold bonds for 6 per cent. gold debentures, series "A," due 2025, of the South-Eastern Power & Light Co., with rights to subscribe for that company's common stock, was approved at a meeting held in Montreal on October 7th.

Missouri Power & Light Co.—The whole of the company's first mortgage and refunding general lien sinking fund series "A" 7 per cent. and series "B" 6½ per cent. bonds, due 1943, are to be redeemed on December 1st at 105 and accrued interest.

Ever-Ready (Great Britain), Ltd.—Interim dividends at the rate of 10 per cent. on the old preference and ordinary shares, and of 4d. per share on the new preference shares have been declared.

Swedish Company.—The report of the *Allmanna Telefon Aktiebolag L. M. Ericsson*, of Stockholm, for the last financial year shows a net profit of 2,040,000 kr., as compared with 2,060,000 kr. in the preceding twelve months. A dividend of 2½ per cent. is being declared. The report states that owing to increasing import duties it has been found necessary to establish affiliated companies in different countries. There are now Ericsson telephone works in England, Austria, Hungary, Holland, France, Poland, Mexico, Finland, Argentina, Spain, and Italy.

French Companies.—*La Compagnie Française des Câbles Télégraphiques*, of Paris, reports a net profit of 6,037,929 fr. for the last financial year as compared with 5,446,379 fr. in the preceding twelve months.

The report of the *Société Electro-Métallurgique de Dives* for the year ended June 30th last shows a net profit of 9,055,252 fr., as compared with only 5,535,631 fr. in the preceding year.

Belgian Company.—The *Société de Câbles et Corderies du Hainaut*, of Eupen, reports a net profit of 1,059,853 fr. for the last financial year. The directors state that during the year considerable extensions were made to the cable section of the works.

Italian Companies.—*La Società Ligure-Toscana d'Elettricità* is increasing its capital from 125 to 175 million lire. The *Società Elettrica del Valdarno*, which is acquiring an interest in the gas undertaking in Rome, also proposes to increase its capital from 80 to 150 million lire.

Fuller's United Electric Works, Ltd.—A meeting of the holders of income debenture stock was to be held yesterday to approve of the appointment of Sir W. H. Peat as a trustee in place of Brig.-Gen. H. A. Jones, the retiring trustee.

Aron Electricity Meter, Ltd.—An interim dividend of 3 per cent. actual has been declared on the 6 per cent. preference shares.

City of Buenos Aires Tramways (1904), Ltd.—A dividend at the rate of 5 per cent. has been declared in respect of the September quarter.

Isle of Wight Electric Light and Power Co., Ltd.—An interim dividend of 4 per cent., free of tax, has been declared on the ordinary shares as in 1924.

Calcutta Tramways Co., Ltd.—An interim dividend of 4 per cent., free of tax, has been declared on the ordinary shares, as last year.

Stocks and Shares.

Monday Evening.

Although to-day, Monday, is by century of tradition, a Stock Exchange holiday, many Stock Exchange offices have been fully staffed by partners and clerks glad (in their due proportions) to have the opportunity, afforded by a few quiet hours, for dealing with the work caused by busy markets and strenuous times. The tides of Stock Exchange activity roll rather capriciously. Some men have more business than they can comfortably handle: others could redouble their energies and still escape overwork. Each market in turn receives, however, its due meed of attention. Brokers, dealing in all the markets, are mostly busy all the time.

General recovery in steam railway stocks followed the intimation that the railwaymen do not intend to be swung at the tail of a tribe of turbulent agitators whose avowed object is to create trouble. The Undergrounds, however, are inclined to be lower: Districts and Metropolitans have both gone back. Lord Ashfield has been indicating the extraordinary way in which the Undergrounds have spread, physically and financially, within the last 25 years. The amount of capital employed, he said, in 1900 was fifteen million pounds in underground railways, in omnibuses and in trams: to-day, it reaches eight times that sum. Mileage on the Underground Railway has more than doubled, rising from 35 to 78. Lord Ashfield suggested that the extensions now in hand might prove to be the end of the present programme.

The same speaker, presiding at the recent meeting of shareholders in the United of Havana Railways, mentioned that the company owns a steam railway and an electric railway, while it also supplies electricity for power and lighting. An American group of capitalists has been trying, according to correctly-informed rumour, to acquire at any rate part of the United of Havana Railways' undertaking. The market price of the stock has been steadily rising for some time past by reason of purchases said to be made on this account. Calcutta Tramways shares are unchanged at 25s. 6d.; the interim dividend of 4 per cent. tax-free, is the same as that of a year ago.

British Columbia Electric Railway stocks are strong, the deferred being 4 higher at 118½, the preferred, at 78½, having gained a point. Brazilian Tractions reacted to 80; the 6 per cent. preference keep hard at 100. Anglo-Argentine first preference regained their small loss of last week, and Mexican issues have been uninteresting.

Edison Swan 5 per cent. first debenture is 3½ higher at 84, by way of reflection of the recent jump in the price of the ordinary shares. The company's 5½ per cent. second debenture stands at 78½ and the 7½ per cent. first preference shares at 22s. The ordinary retain their big rise at 9s. 3d. Manufacturing shares are again very firm, and shares are difficult to buy. Brush have stiffened to 24s. 6d. English Electric ordinary and preference are 6d. better in each case. Cables are good, too, Henleys at 3 7/16 being ⅛ up, and Callenders equally better at 3⅜. India-Rubbers are a florin higher at 1⅛. On the other hand, Johnson & Phillips lost 1s. after their previous big advance.

Globe Telegraph ordinary have improved to 18, Western Telegraphs to 17, and Eastern Extensions to 17¾. Indo-Europeans are down a sovereign, to 43½. The telephone shares hold their strength. United River Plates at 7 7/16 have gained 1/16 and the new shares are close to 46s. premium. Those who have the right to apply for the latter should see to it that they do not let slip the fine bonus offered to proprietors by the new issue.

Marconis drooped to 27s. 6d., Canadian Marconis to 6s. 10½d. The Radio Corporation of America reports, for the second consecutive quarter, a deficit that is thought to be due to rate cutting, and a smaller demand for radio sets. Burndept shares, still in request from America, have continued to harden, the shilling deferred shares being 5s. 6d. United States capital is now turning towards some of the British motor companies in its search for profitable employment. Possibly the Americans do not feel flattered at the reception accorded to their overtures for introducing United States capital into well-known electricity supply companies that operate on this side.

The list of prices in the London group is very quiet. London Electric preference strengthened to 5⅝. Elsewhere, sixpenny gains have been secured by Newcastle-on-Tyne ordinary and North Metropolitan preference. Lancashires remain at 25s. 6d.; the new issue of shares will be made, it is expected, almost at once. The iron and steel market is fairly good. Babcock & Wilcox have risen to 53s. Interest in rubber shares remains at a high level, though not so high as that of a month ago. Prices are good in all sections of the market. A hint may be dropped as to the advisability of using keen discrimination when applying for shares in new rubber companies.

The Institution of Electrical Engineers.

Inaugural Address by R. A. CHATTOCK, President I.E.E. *(Abstract).*

(Concluded from page 693.)

From articles that have appeared in the Press it is fairly clear that the Report of the Committee set up by the Government will propose to change over to 50 periods those districts in the country that are being supplied with alternating current of periodicities other than 50. It appears that the proposal is designed: (1) to make it possible to exchange current between districts by means of large-capacity trunk lines linking them together; (2) to reduce the range of apparatus that now has to be manufactured and stocked, and so cheapen the purchase price of all electrical apparatus; and (3) to do away with the necessity of converting alternating current to direct current for general distribution.

Considering (1) first, trunk lines for this purpose would require to have a capacity of at least 20,000 kW, and run at a voltage not less than 110,000 between phases. The length of the lines required to connect up all large centres of supply would be roughly 1,900 miles, and the cost would amount to approximately £5,700,000.

It is obvious that the bulk of the supply in each district must be derived from stations on the spot, as the loss in transmission over 50 or 100 miles would cancel out any problematical saving that might be effected through better natural facilities. Such stations having high economy of operation are coming into existence, and it is becoming apparent that each district can economically serve itself and provide its own stand-by plant without any necessity for drawing supplies from other districts at such an enormous capital cost.

By all means link up the individual stations in each district, at a fraction of the cost of linking-up nationally, and take advantage of the high economy of operation of the best station in each district at times of light load.

It has been stated that such trunk lines will open up the rural districts throughout the country. It is, I think, obvious that such large-capacity lines cannot be safely tapped except at well-defined centres, and that the opening-up of rural districts must depend upon a network of thin overhead lines radiating from the large centres of supply. The rural demand can never justify a heavy expenditure on distribution, and the greatest care and economy will have to be used in designing such distributing systems.

Turning now to (2), there should be an average saving of 15 per cent. in the cost of 50-period electrical apparatus, such as generators, motors, and transformers, over 25-period apparatus. This is to some extent counteracted by the higher speed at which 50-period motors run, necessitating speed-reduction gear. 50-period induction motors also create a lower power factor on the system, the difference being about 5 per cent., and this curtails the carrying capacity of the distributing mains and necessitates the installation of larger transformers. There does not therefore appear to be much real advantage in this claim.

As regards (3), it is admitted that there is a very slight flicker noticeable on the lights when supplied with low-tension 25-period current. This can, however, be largely eliminated by suitable shading in living rooms, and it is only in these that there can be any reasonable objection raised. In factories and business premises, and even in drawing offices, it is being very largely used without any inconvenience.

In most large towns direct-current distribution is already in existence, and the recent development of the mercury-arc rectifier, whilst being admittedly rather more expensive than a.c. transformer distribution, has solved the problem of the high cost of rotary-converter sub-stations and the necessity of employing labour to run them for supplying outlying residential districts.

It must be admitted that direct current is safer than alternating current for domestic apparatus, and now that this apparatus is coming into such general use this point should receive careful consideration.

If railway electrification becomes general in this country—and there is strong evidence that this is coming in the near future—it seems certain that direct current at a pressure of 1,500 volts will become standard. This is being largely adopted on the Continent, and military considerations will probably weigh heavily in the matter. If so, rotary converters or mercury-arc rectifiers will probably be used, and for these 25-period current is far preferable to 50-period. We must not forget that we want the railway load to improve the load factor and reduce the cost of supply.

Let us now consider the probable cost of such a change. It would be necessary to replace the whole of the a.c. apparatus with new 50-period plant, not only that belonging to the supply undertakings, but also that installed on consumers' premises. It is estimated that about 25 per cent. of the electrical plant installed in the country is other than 50-period plant.

I have made a close estimate of the capacity of the a.c. plant that would have to be replaced in the Birmingham area. This amounts to 486,870 kW belonging to the undertaking, and 337,350 kW belonging to its consumers. Total, 824,220 kW.

The cost of this at £3 10s. per kW would be £2,880,000.

Allowing scrap value for the old plant of 6¼ per cent., because there would be no market for it, it would realise £180,000.

The net cost of replacement would therefore be £2,700,000.

There would be other costs, such as the provision of duplicate mains and switchgear to make the change-over possible, the salaries of a considerable staff, compensation for interference with consumers' business, &c., which I have estimated at £4,000,000.

The total estimated cost for Birmingham would therefore be £6,700,000.

Applying this estimate to the rest of the areas in the country using periodicities other than 50, we get a figure for the country of approximately £27,000,000.

Can such a colossal expenditure be justified, for the reasons I have indicated above—reasons which, as I have shown, will not really bear investigation?

If the Government wants to develop the electrical industry and to cheapen the cost of supply, it would be far more profitable to spend the money on improving the load factors throughout the country. This could be done by electrifying the railways and equipping the coal mines with complete electrical plant for getting the coal and pumping and ventilating the mines. Expenditure of this kind would prove to be remunerative, and could be regarded as a compulsory loan to cheapen and foster what are, after all, public utility services.

The United States of America is frequently held up as an example to be followed. They run two frequencies in America—25 periods and 60 periods—and they are not contemplating changing over one of these to the other. Let us therefore take a leaf out of their book and leave well alone.

A development that has recently been introduced in Birmingham has had the effect of relieving the ordinary direct-current three-wire network and its system of feeders. I refer to the arrangement that is now made to couple small power consumers to the extra-high-tension three-phase system. Hitherto this system, which is supplied at a pressure of 5,000 volts between phases, has been confined to consumers who have at least 100 h.p. installed, as each service entailed the use of three oil-switch panels for controlling the incoming and outgoing cables and the supply to the consumer. A special type of service connection has now been developed at a very much reduced cost, which makes it possible to supply power consumers whose demand is only 30 h.p. and upwards, the only difference between this and the larger consumer's service being that the connection is teed off the main instead of being looped in and out, so that there is no alternative source of supply. This is, however, only comparable with the ordinary power consumer off the d.c. network. It is found that this arrangement is likely to have a very beneficial effect upon the cost of distribution generally.

I am frequently asked by parents what kind of training I should recommend to fit boys for the engineering profession. As a broad principle, I think that a boy should enter a technical college when he leaves school. He should spend not less than three years at college, and should endeavour to obtain some engineering degree. The necessity for demonstrating that he has a good general education as well as a thorough technical education is very important, as he will find that after he has passed through the junior stages of his career, which of course chiefly require technical knowledge, he will have to undertake duties of a managerial nature, which require a more general knowledge and the power to conduct correspondence with lucidity. This can only come easily to a man who has had a good general education, who is conversant with literature, and who is able to convey his ideas with conciseness.

After finishing his technical course at college, he should spend at least two years in some large engineering works.

When his training is completed, the boy should be about 21 years of age, and should be capable of taking a position as junior engineer in any electric supply undertaking. His advancement from this position to higher positions must depend largely upon his own ability.

It is interesting to note that the Electrical Power Engineers' Association is arranging for those of its members who have passed a certain standard to be allowed to call themselves "qualified electrical engineers." Before they become so qualified, they must have had a certain number of years' experience in supply undertakings of a certain size, and they must have passed the Examination required for Associate Membership of this Institution or some examination equivalent to it. I think that this is a very valuable step in the right direction, in that it will tend to ensure that engineers of supply undertakings can demonstrate that they have been properly trained.

In my own undertaking it has been the rule for some years that engineers who have not passed the A.M.I.E.E. examination or its equivalent cannot rise higher in the technical staff than a certain grade, and those men who do not so fit themselves will find in a few years that younger men will be passing over their heads. In the case of old servants, a certain amount of latitude should be allowed as long as there is proper willingness and endeavour on the part of the individual to fall in with this very necessary requirement.

I should like to take this opportunity of urging those controlling not only electricity supply undertakings but also manu-

facturing concerns, to consider very carefully whether it would not be to the ultimate benefit, both of their own undertakings and of the industry as a whole, to make it compulsory that men on the technical staff should pass a certain standard. The necessity for this is clearly demonstrated by the fact that when one advertises for a technical assistant, out of the 150 to 200 applications that are received, only about 20 per cent. are of any real use. The rest, whilst they have had some experience, are generally either limited in such a way that they can be trusted to handle only one particular section of the work, or they are obviously unfitted for even as much as that.

If all employers had required a certain standard, men of this kind would never have got as far as they have, and the material available to be drawn upon, while being less in quantity, would be greatly improved in quality.

In conclusion, there appear to be two main points to which supply engineers should give special attention. I refer to improving the load factors of our undertakings, which have to all intents and purposes stood still for so long; and to decreasing the cost of distribution, which has recently tended to increase and to counteract the economies that are being practised in other directions.

A Survey of the Fields of Electrical Progress.

By J. P. THOMPSON.

(*Abstract of the Chairman's Address;* Dundee Sub-Centre *of the* Institution of Electrical Engineers.)

The duties of those engaged in electrical work are varied and complex. It is therefore natural that men should find themselves gradually specialising in one branch or department and, in fact, it would be quite impossible for the average individual, at any rate, to be an expert in every department of electrical development. Electricity is rendering, in a multitude of ways, great service to man. This service will go on increasing, and as electrical engineers we should endeavour to develop the spirit of service. We cannot cultivate the idea of service to any great extent without becoming enthusiastic in our work, and all electrical engineers should be enthusiasts. Enthusiasm run wild may, however, be dangerous. The man who insists that electricity should be used for every cooking, transport or hot water supply problem, without thoroughly going into the details of the case, may easily do harm. There are questions to be considered, such as the capital cost of the apparatus and the cost of altering existing arrangements, &c., and these may, for the time being, render a scheme impracticable.

The public cannot, I think, know too much about electricity, and in this connection the Electrical Development Association is carrying on very excellent educational work in bringing to the public notice the uses and advantages of electricity supply. The country, as a whole, is passing through a period of serious trade depression and it is encouraging to note that, while such is the case, the output of the electricity stations for the year ended March 31st, 1925, showed an increase of some 734 million kWh compared with the previous year. This is an increase of 11 per cent., but the fuel used increased by only 5.8 per cent., showing that the thermal efficiency is improving.

The problem for the country is to obtain reliable supplies of power at as low a cost as possible. For works making a large demand for both power and steam, where a case can really be made out for generation on the spot in place of purchasing power, I think the provision by the supply undertaking of suitable plant on or close to the consumer's works, coupled with a connection to the main cable system, would reduce the total amount of generating plant required and at the same time afford the most reliable supply at the minimum cost.

The demand for power purposes will, of course, not remain stationary, and certainly no one wishes that it should, but I want to bring out the tremendous possibilities being opened up by the domestic load. There seems no reason why the sale of energy to this class of consumer should not increase much more than ten-fold. While, according to the return of the Electricity Commissioners for 1920 to 1923, the sales for lighting and domestic uses and for power purposes represented respectively 19 per cent. and 68 per cent. of the total, the revenue was in each case approximately 42 per cent. of the total. A ten-fold increase in sales for domestic purposes would probably increase the revenue approximately three-fold. This perhaps is the reason why some engineers seem to fight rather shy of pushing the domestic load, apparently fearing that the whole of their cable system will quickly become loaded up and that in no time they will find themselves in all sorts of difficulties. But why not load up cables? Which is the better, a factory making a demand on the station of 100 kW, or a considerable number of houses providing a combined load on the station of the same amount? Such a factory working 44 hours per week might possibly take 220,000 kWh per annum, and this would be possible only on a load factor of 100 per cent. Take, now, 100 houses, each using 200 kWh for lighting and assume an increase in consumption of 180,000 kWh for domestic uses. The maximum load on the station for this output of 180,000 kWh for domestic purposes would, however, due to the better load factor of that class of load, be less than 100 kW and probably not more than 68 kW. While the load factor of the individual domestic installation is low, the diversity factor comes to the rescue to such an extent that the load factor on the station in respect of supplies for domestic purposes other than lighting is considerably higher than that from supplies to factories and other concerns working the ordinary day hours only.

So far, then, as the cost of generation, transmission to substations and transformation is concerned, current for domestic supplies can be delivered at the low-pressure terminals of the sub-station transformers more cheaply than for factory supplies. The only additional cost, therefore, of supplying energy for domestic purposes from the low-pressure distribution mains compared with supplying energy to a factory from a sub-station in the factory, is that in respect of the outlay in providing additional copper in the distribution mains. The interest and other charges on such additional outlay is certainly more than provided for by the revenue received from the sale of 50 per cent. more current than would be taken by the factory for the same loading on the station plant, transmission cables and transformers. It would appear, therefore, sound practice not to cut down too much the copper in new low-pressure distribution mains, especially as such additional copper is generally obtained at comparatively little extra cost. The problem may be considerably simplified by having transforming sub-stations placed at frequent intervals. This allows a fuller use to be made of the copper in the low-pressure mains without undue voltage drop. For purely residential districts and thinly populated areas it would seem desirable to adopt a higher pressure, say, 3,000 volts, for the distribution mains, using transformers for each house or for groups of houses as required, and in this way ultimately limiting the low-pressure distribution cables fed from each transformer to, say, not more than a few hundred yards in length. It would seem unnecessary to provide any switch or fuse gear on the 3,000-volt side of these transformers, and the transformers would simply form part of the cable system. The space taken up by a transformer of, say, 100 kW, arranged in this way is very small and should easily be arranged for.

Supply engineers are apt sometimes to look upon installation work as a job that any fool can tackle. That is not my own view, and I think there is a large scope in the contracting business for good engineers. Unless premises are wired, the supply undertakings cannot sell energy, and it is the business of contractors to wire premises. Supply undertakings should, therefore, welcome every application brought in by contractors and should give contractors, especially the smaller firms just starting business, all the assistance possible. On the other hand, contractors should see to it that only sound jobs are carried out, as otherwise they will bring discredit, not only on themselves, but on the whole industry, and retard the rate of development. There is no doubt that but for the high cost of wiring, new consumers of electricity would be secured at a very rapid rate. To reduce the cost of wiring by using inferior material and rough workmanship will not help matters. Is there no other way of reducing installation costs? Any method of providing satisfactory installations at less cost would undoubtedly secure increased business for contractors and supply undertakings both. There would still remain, however, the difficulty of the tenant occupier, and some system of assisted hire purchase or free wiring, call it what you will, seems necessary in order to deal with a very large proportion of the at present unwired premises. Even now the supply undertaking takes the risk of putting down power stations, transmission cables, sub-stations, distribution mains, service lines, and meters. Why not carry on a stage further and wire up to the actual lamp or other current-consuming device, and by so doing secure more consumers per unit length of distribution main?

As one kWh has a fixed heat value, all electric fires have, in one sense, an equal efficiency of 100 per cent. What may, however, be called the effective efficiency, varies very considerably, and it is always necessary when advising on the use of electric heating, to try and figure out what exactly is the duty required of the heater, otherwise the best results cannot be expected. In this connection it is well to remember that the best condition for working is to have warm feet and a cool head. For example, a small amount of heat applied under a desk or table from, say, a 250-watt fire, will frequently give better results than a 2,000-watt fire placed in the wrong corner of the room. The heating of water offers some very interesting problems, and while it may be difficult to see how electricity can compete in cost with coal or coke for heating large quantities of water, there are many cases where the matter is not nearly so hopeless as may appear at first sight. The very high efficiency of the apparatus, the ease with which the water may be heated at points of use and the absence of all labour, fumes, dust, &c., are frequently sufficient to turn the scale

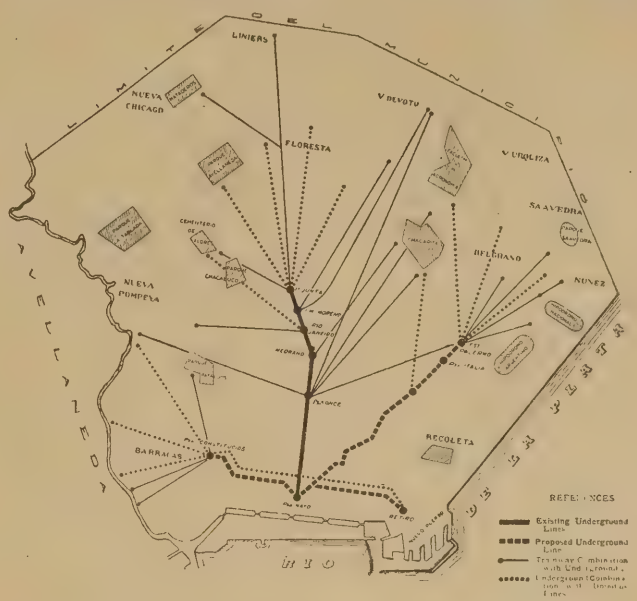
ntirely in favour of electricity. Water heating also opens up ossibilities of securing a considerable load at a steady rate ver the 24 hours of each day. The battery vehicle does not eem to make the progress in this country one would have xpected. We all know the dislike many engineers have for torage batteries, a dislike brought about, in many cases, I elieve, by installing a battery for a certain purpose nd using it for duties for which it was never intended. We hould, however, be just, and in such cases it is hardly fair o blame the battery.

The trolley 'bus is being tried in a number of districts and ne would like to see this type of vehicle proving successful; n certain districts, given definite routes of suitable mile-ge, one would imagine that the battery vehicles even might lso find a place. With batteries suitably arranged for quick xchange at a depôt, these vehicles would appear to possess ertain advantages over petrol vehicles, in addition to providing profitable load for the supply undertaking. And why not use ome of the country's coal for this purpose instead of import-ng petrol? The surface of our roadways generally is being teadily improved, and I really think we should give more ttention to the use of battery vehicles in transport problems han we have perhaps done in the past, and I hope we shall oon become more familiar with the appearance of such vehicles n our streets.

I am glad to notice that the supply of electricity o farms is receiving increasing attention. Where 6,600-olt or 11,000-volt lines or cables exist there is no difficulty n giving a supply from them. In my own area a supply is t present given to some 50 farms and I know how greatly the dvantages are appreciated by the farmers. There is no doubt bout the advantages arising from a supply of power "on ap" at the farm, and it is, I think, up to us to see that elec-ricity is brought within reach of as many farms as possible, nd in the interests of the country we cannot do this too soon. 'or purely farming and rural areas, I think, it is likely that ome cheap form of distribution, for the most part overhead, t a pressure of about 3,000 volts, will be found the most suit-ble all round.

We still hear a good deal about "cheap and abundant sup-lies of electricity"—a rather unfortunate phrase, I think, and ne that is apt to do more harm than good. The price of elec-ricity in this country is not high and is certainly not respon-ible for trade depression. It is questionable if many indus-ries finding it difficult, in these days, to make ends meet, would be appreciably better off if supplied with electricity free. The price of electricity for various uses should very largely e regulated by the cost of the alternative methods of obtaining he power, light, or heat required.

The Buenos Aires Transport System.



The Anglo-Argentine Tramways Company's Plan.

The accompanying map, for which, together with the descrip-ive notes, we are indebted to the *Review of the River Plate*, nakes clear the traffic arrangements in Buenos Aires so far as he Anglo-Argentine Tramways Co., Ltd., is concerned. The otes are based on a report by the general manager of the ompany (M. Marcel Rongé) to the municipal authority.

In Buenos Aires the communication between the centre of he city and the outer areas is becoming daily more difficult nd slower. This is due to the fact that the centre of activity quite a small area) does not coincide with the geographical entre; the narrowness of the streets in the centre of activity; nd the absence of an efficient traffic-regulating scheme. lthough the tramways contribute to the congestion it is con-idered that upon the whole they have helped to make the rouble less acute owing to their large carrying capacity in elation to their bulk. The company realises, however, that he best means of dealing with the problem is by means of ubways which combine the advantages of capacity, velocity nd commodity. The surveys effected by the company have ed to the conclusion that the construction of an underground ine in a north-south direction between Retiro and Constitu-ion, linking up the centre of the city with the great terminal tations of the Central Argentine, Cordoba Central, Pacific, nd Great Southern Railways and these stations with each ther, would play a part of the first importance in the sum otal of the measures designed to alleviate the traffic intensity f the central streets. This underground line, which would ross the zone of the greatest activity beneath the streets of Chacabuco-Maipú, combining with the line to Plaza Italia at trans-shipping station at the junction in the Avenida Presi-lente Roque Saenz Peña, and would likewise be in communi-ation by means of a tunnel with the Perú station of the exist-ng subway, would tend to facilitate the circulation in those streets within the central zone which run from north to south, nd would afford to the public constantly arriving by the rail-ways mentioned a rapid and comfortable means of transport to their places of daily occupation.

The company has also recognised the convenience to the ublic of the construction of a third underground line connect-ng the centre of the city with the densely populated zones n the north-west—Belgrano and neighbourhood. The connection f the three lines has been planned in such a manner that passengers who so desire can pass from one line to another at any of the trans-shipping stations without having to go above ground. The Anglo-Argentine Tramways Co. proposes as a result of the alleviation of the intensity of the surface traffic to reduce the circulation upon certain lines and to totally abandon others in the streets with the densest traffic. On one route, to avoid inconvenience to the public, an omnibus service will take the place of the tramway. To effect distribution of passengers from the subway termini a number of omnibus services will be organised as shown on the map.

In the opinion of the company, this plan, which takes account of the requirements for some years ahead, and would

The Buenos Aires Transport System—Existing and Projected.

add to the already vast transport system of the city 22 km. of underground lines and 180 km. of omnibus routes at a capital cost of $130,000,000 m/n, is at once methodical and progressive and permits of all the extensions which the future growth of this great capital may render desirable or necessary.

An expert committee appointed by the Buenos Aires Municipal Council to study the scheme has advised the Council to adopt it. This committee also proposed a new tariff of fares on the various parts of the Anglo-Argentine Tramway Company's system.

Conditions in Austria.

Power and Railway Developments.

The Commercial Secretary of the British Legation at Vienna (Mr. O. S. Phillpotts) has forwarded a report upon commercial and financial conditions in Austria* to the Department of Overseas Trade.

In his introduction to the report, Mr. Phillpotts says that the period of inflation, followed by one of severe industrial depression, is now passing, although industry and trade are still more or less in a condition of stagnation. Meanwhile the important results of the reconstruction scheme, the stabilisation of the currency, and the practical elimination of the deficit in the State finances, have not been affected. These would not in themselves be sufficient if the general economy of the country—the relation of production to consumption—were unsound, but they form the indispensable basis for any permanent solution of Austria's problems.

As happens in other countries after a period of inflation and a speculative boom, the general conditions of credit in Austria have been extremely bad since early in 1924. Creditors, both domestic and foreign, have had great difficulty in collecting payments, and there has been a regular epidemic of insolvencies. This has not only affected numerous new firms started to take advantage of the inflation period, but firms of older standing, too, have got into difficulties. The general shortage of capital and the high rate of loan interest is proving fatal to many concerns.

Trade and Industry.

A new tariff was put into force at the beginning of the current year; rates are in most cases higher, in many cases much higher, than those that have hitherto been in force, but they are, however, still considerably lower, generally speaking, than those in neighbouring countries. The import of certain British goods, including radio apparatus, will be affected by the increased duties. The Commercial and Shipping Treaty between this country and Austria was finally ratified in February last, and this should aid in the return to the pre-war trade conditions between the two countries. Commercial treaties have also been negotiated with Czecho-Slovakia, Germany, and France. Industrial depression and

* Stationery Office. 1s. 6d. net.

unemployment have been very prevalent of late (the report is revised up to August, 1925), but the iron and steel industry shows an improvement. Production in the first quarter of the current year was considerably greater than in the latter part of 1924, though it did not equal that of the first quarter of that year. Although the bulk of the imports of finished British goods into Austria consists of textiles, there are other important items. During 1924 machines and apparatus to the value of £63,500, electrical apparatus to the value of £65,000, and "other instruments not musical" to the value of £54,000 —an increase of £40,000—were supplied by Great Britain. The last increase is attributed partly to the greater imports of radio apparatus. The exports of incandescent lamps to the United Kingdom fell from £77,000 in 1923 to £62,000 in 1924. It is stated that Austrian exports to the United Kingdom during the first quarter of 1925, as well as trade in the opposite direction, showed substantial increases.

Mr. Phillpotts says that the share of the United Kingdom in Austrian trade has risen, and is likely to rise further at the expense of the Succession States, and he considers that Austria will probably continue to provide an expanding market for British trade.

An appendix to the report showing Austria's exports during 1923 and 1924 includes the following items:—Electrical machinery and blow lamps: 1923, 26,067,000 gold. kronen; 1924, 45,383,000 kr. Electrical apparatus and accessories: 1923, 12,438,000 kr.; 1924, 23,238,000 kr. These goods were supplied chiefly to Germany, Czecho-Slovakia, and Jugo-Slavia.

Hydro-electric Development.

Great importance has been attached in Austria, since the war, to the exploitation of the ample water power available in the Alpine districts, both for electrifying the railways and for industrial and other purposes, owing to the country's dependence upon foreign coal and oil. The total available water power in the country is calculated at 1,657,000 h.p. at minimum low water, or probably 3,500,000 h.p. yearly mean, of which under 10 per cent. was harnessed at the end of the war. The provincial governments took up the matter, and between 1920 and 1923 separate companies were founded for all the different provinces. The original capital was provided in the country by local authorities, banks, and the public. When this was exhausted, endeavours were made to obtain further capital from abroad, and as soon as the beneficial effects of the League of Nations Control became obvious, a good deal of foreign money was invested in some of the provincial companies, chiefly Italian, American, and Swiss, and some British, in Salzburg. More would have been available if Austrian companies had been willing to place orders abroad for equipment, but as Austria is well able to supply this herself the work has been done in the country. The provincial companies have undertaken a number of large works of several thousand h.p. each, involving big dams, large tunnels or pipe lines, and long power transmission lines. Other important works are being carried out by the Austrian Federal Railways and private companies, and altogether in the years 1921 to 1924, 68 works of over 500 h.p. each, totalling 214,300 h.p. (yearly mean) were commenced. At the end of 1924, 28 of these works (85,000 h.p.) had been completed, and in the first half of the current year a further 18,000 h.p. was added by the opening of the works at Opponitz, in Lower Austria, and at Teigitsch, in Styria, each delivering over 9,000 h.p.

In 1921 the Austrian authorities drew up a 15-year programme of hydro-electric works, aggregating 900,000 h.p., but it is unlikely that this programme will be fully realised in so short a period.

Railway Electrification.

The last 12 months has seen the completion of nearly all the first part of the railway electrification programme in the west of Austria, which was laid down in 1920. Electric traffic began on the Salzkammergut line between Attnang and Steinach-Irdning (108 km.) in July, 1924, and in May this year the electrification of the Arlberg line was carried as far as Bludenz in Vorarlberg (161 km.), so that electric trains now run all the way from Innsbruck through the Arlberg tunnel, and to within 30 or 40 km. of the Swiss frontier. The remaining short distances to the junctions with the Swiss electric lines at Bregenz and Buchs will, it is expected, be completed some time in 1926. Apart from the saving of time which this electrification will effect, it is calculated that about 130,000 tons of coal will be saved annually.

Early in 1925 the Austrian railway administration endeavoured to arrange for a foreign loan to carry out the next stage of the programme, chiefly the lines between Innsbruck and Salzburg. The Control Committee of the League of Nations refused permission for a new loan, but later sanctioned the release of 18 million dollars of the League of Nations Loan for this purpose. This sum is to cover the electrification of 306 km., and it is expected that the electrification of the lines will be completed by the end of 1928.

The necessary power is obtained partly from water-power works constructed specially for the purpose, such as the Spullersee in Vorarlberg, but in the future it will be taken also from the works built by the provincial companies, such as that on the Achensee. The Austrian railways employ the single-phase system at a frequency of 16⅔, and a pressure of 15,000 V. This system is also used in Bavaria—a fact that will facilitate through traffic with Germany.

The Electrical Import and Export Trade of Hungary.

The following table gives particulars of Hungary's imports and exports of electrical machinery and apparatus in 1924, the total values in gold crowns being stated, together with the total weights in quintals and the weights by countries of origin and destination. Where available, comparative figures for 1923 are also given. It will be noticed that owing to the lack of detailed classification in 1923, the weight of "Electrical apparatus not elsewhere mentioned" appears disproportionately high as compared with 1924.

The Pacific Cable Board.

Annual Report and Accounts.

The annual report and financial statement of the Pacific Cable Board, which is representative of the British, Canadian, Australian and New Zealand Governments, for the year ending March 31st, 1925, outlines the year's working and shows that the receipts (£549,917) exceeded the ordinary working expenses (including the normal payment of £30,000 to the reserve and renewal fund) by £254,589. After taking account of the annuity of £77,544, payable to the National Debt Commissioners in respect of interest and repayment of capital, and the annuity of £9,150 payable to the reserve and renewal fund in respect of interest and repayment of money borrowed from that fund for the Sydney-Auckland cable (1912), a surplus of £167,893 remained, the whole of which has been devoted to the reserve and renewal fund. The traffic receipts (£535,013) were less by £9,768 than those of the previous year. This falling off is accounted for partly by rate reductions which were introduced on December 1st, 1924, and partly by a reduction in the volume of ordinary traffic. The expenditure (excluding special appropriations) was less by £5,682 than that of the preceding year, and the total assets of the reserve and renewal fund amounted to £2,279,826.

The forthcoming duplication of the cables between Vancouver Island and Fiji will involve expenditure of approximately £2,400,000 and the work will not be completed until the end of September, 1926. It is expected that during the period the reserve and renewal fund will be sufficiently strengthened to meet the cost of duplication in full. The effect of the reconstruction of salary scales has been to increase the liabilities of the pension fund and the net sum provided to cover the increased liabilities was £6,600.

The depôts, instruments and plant generally, have been maintained in a high state of efficiency. The cable between Norfolk Island and Southport became interrupted in the vicinity of Southport on June 13th and was repaired by the *Iris*; on June 27th a fault declared itself on the same cable in the vicinity of Norfolk Island, and a new shore end was laid out from Norfolk Island by the *Iris*. As the Board's facilities between Fiji and Australia enable traffic to be directed by three different routes, the disturbances did not cause any inconvenience to the Board's business. A new tri-core shore end was inserted by the *Iris* at Suva on the Fanning Island section in November, 1924. This completed the provision of tri-core shore ends on both sides of each of the long cables.

The Board was occupied throughout the year under review in giving consideration to the duplication of its system in the Pacific, and contracts have been placed (*a*) with the Telegraph Construction and Maintenance Co., Ltd., for the Vancouver Island-Fanning Island section; (*b*) with Messrs. Siemens Bros. and Co., Ltd., for the Fanning Island-Fiji section. The contractors have undertaken to complete the laying of these cables by September 30th, 1926. The new cables will be continuously loaded with a metallic alloy of high permeability and their guaranteed traffic transit capacity is more than twice as much as the capacity of the existing cables, and it is expected that in practice the guaranteed capacity will be largely exceeded. The total cost of the cables laid in 1923 (*a*) Suva-Auckland (direct) and (*b*) Southport-Sydney, including equipment and engineers' fees, amounted to £337,940.

The total expenditure on the wireless investigations at Vancouver Island and Fiji (referred to in the report for 1922-23) amounted to £7,155, and the investigations established that the reception possibilities in the localities referred to were satisfactory, but in view of the cost of running wireless stations, as compared with the extra cost of working duplicate cables, and of the difficulty of securing secrecy and the certainty of continuous communication, it was ultimately decided to complete the duplication of the cables.

The landlines leased by the Board from the Canadian Pacific Railway Co. worked well and the service on the landline which is allocated by the Australian Commonwealth Government for the exclusive use of the Board was generally satisfactory, but was affected during the latter part of the year by reconstruction work. The laying of the cables in the British West Indies and British Guiana was completed in July, 1924, and the last of the wireless stations was handed over by the contractors in February, 1925. Owing to the wireless stations not being completed, it was necessary to postpone the opening of the system until December 1st, by which time arrangements had been made for telegraphic communication with all the islands.

The office and residential property at the various stations has been maintained in a satisfactory state of repair. The new concrete office building at Suva was completed in September, 1924. The vessels of the Union Steamship Co. of New Zealand made five calls at Fanning Island, the total expenditure during the year on this service having been £10,886. The Board's cable maintenance vessel *Iris* continues to be maintained in first-class order. No changes in the membership of the Board took place during the year under review.

Mr. John Milward, the Board's manager in the Pacific, and chief electrician, retired on pension in August, 1924, having reached the age of 60. He had occupied a prominent position in the Board's service from the time the system was first opened. No successor has so far been appointed as manager in the Pacific, and Mr. R. I. S. Bain, the Board's senior superintendent, has been acting in that capacity since Mr. Milward left Australia. In future the position of chief electrician is to be kept distinct from the management. Owing to the growth of the Board's business it is not possible for the manager, who is mainly occupied with administration work, to devote the requisite attention to the technical side which is required of a chief electrician. Mr. G. B. Winkfield, who had been Mr. Milward's principal assistant in technical matters, has been appointed chief electrician. Two superintendents, Mr. T. R. Blackley and Mr. Alfred Smith, reached retirement age during the year under review and withdrew from the service on pension; the vacancies have been filled by the promotion of Mr. T. F. Price and Mr. J. Sherlock.

The Board has notified full adherence to the International Telegraph Convention which it has not hitherto been able to do owing to the fact that its connecting administrations across the Atlantic did not adhere in every respect. The rates for ordinary messages between the British Isles and Canada, on the one hand, and Australia and New Zealand, on the other hand, were reduced on December 1st, 1924; the reduction of receipts resulting from this cut is estimated at £35,000 per annum.

On May 1st, 1924, a night letter service was introduced for traffic exchanged between Australia and New Zealand and was extended on December 1st, 1924, to traffic between Fiji and Australia and New Zealand.

Some sensational results obtained in handling urgent-rate messages conveying to the news agencies in London results of cricket tests matches in Australia are worthy of record. For days at a time the delay on urgent-rate telegrams was never more than four or five minutes, and on several occasions was as low as one minute.

During the year approximately 11,900,000 paying words of international traffic (*i.e.*, traffic other than local messages between Australia, New Zealand, and the Pacific Islands) were transmitted across the Board's system; this was approximately 550,000 words above the total of the previous year, and established a further record. The ordinary or full-rate international traffic showed a falling off of approximately 105,000 words, week-end telegrams 145,000 words, and Press messages 250,000 words.

There was an increase of 36,000 words in the deferred ordinary international traffic, of 17,000 words Government, and of nearly a million words of daily letter telegram traffic. The increase as regards daily letter telegrams was for a whole year, as compared with only seven months of the previous year. The daily letter telegram service proved exceedingly popular, and the falling off of the ordinary and week-end traffic was no doubt accounted for by the use which was being made of the cheap " daily " service.

In addition to the international traffic, approximately 2,700,000 paying words were carried between Australia and New Zealand and between those Dominions and the Pacific Islands; this is approximately 600,000 words more than during the previous year. Ordinary local traffic was less by 240,000 words than that of the previous year, but the new service of night letter telegrams produced 868,000 words, and no doubt the introduction of this new service accounted for the reduction in the volume of ordinary traffic.

Hydro Electricity in Norway.—Before a meeting of the Polytechnical Association in Oslo in October, which was attended by the King and Ministers of State, Engineer Ove Collett discussed the reasons why Norwegian water powers were not being developed for industrial purposes. He stated that it had been a great disappointment that so little progress had been made in the further utilisation of the water powers and the consequential industries. Norway had the cheapest water power in the world, but it did not possess a stable value. If it were desired to render the water powers fertile it was necessary to get wealthy foreigners to take an interest in these powers. The only foreigners who had provisionally entered the field since the war had acquired at low prices the Hoyang, Tysse and Sundlokken undertakings, but not a single additional horse power of plant had been installed. Yet some millions were awaiting to be brought into use. Foreign power consumers were turned away from the idea of developing the water powers because of labour conditions, taxes, concession conditions, &c. Although the Norwegian fixation of nitrogen industry had had a favourable course at first, it was now in a difficult position and only produced some 28,000 tons per annum in various forms. On the other hand, in Germany a great industry had been developed and was now able to turn out about 400,000 tons of nitrogenous fertilisers per annum. At the close of the war there were from 25 to 30 undertakings engaged in the electrochemical industry in Norway; nine of these had been compelled to cease operations. Except the known aluminium and nitrogen works only one of the others had yielded any dividend since the war. During the discussion it was also submitted that taxes had reached an undue height and that the conditions under which concessions were granted ought to be ameliorated.

New Electrical Devices, Fittings and Plant.

(Readers are invited to submit particulars of new or improved devices and apparatus.)

A New Speed Controller.

A new motor speed controller particularly suitable for use with stokers, conveyors, travelling ovens, &c., has been developed by the Louis Allis Company, Milwaukee. The device, (fig. 1) the "Allis Adjustable Delivery Motor Drive," consists mainly of three elements, the L-A multi-speed, squirrel-cage, a.c. motor, a revolving drum for establishing the average speed, and contactors for switching the motor. In the operation of the drive a fractional-h.p. motor is used to revolve the selector switch drum at 1 or 2 r.p.m. By changing the position of a movable brush, a two-speed motor, for instance, can be made to run all the time on the high speed, all the time on the low speed or any desired portion of the time on the high or low speeds. By choosing a motor the high speed of which is higher, and the low speed lower, than it is ever desired to run, an infinite number of steps can be obtained.

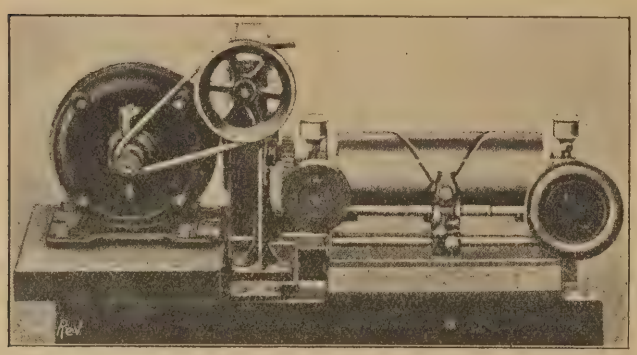

Fig. 1.—Motor Speed Controller.

A Portable Cable Testing Plant.

The accompanying illustration (fig. 2) shows a rather interesting portable generating plant that the ASTER ENGINEERING CO. (1913), LTD., of Wembley, Middlesex, has recently constructed to the order of British Insulated & Helsby Cables, Ltd., for supplying electricity for high-pressure testing apparatus in connection with cable installations.

The design of the set is such that it can be towed at high road speeds, thus constituting an extremely mobile plant. Suspension is on approved automobile principles, the set being carried on a single axle fitted with 820 by 120 mm. pneumatic tires and mounted on semi-elliptic springs. The towing eye is adjustable in height to facilitate attachment to lorries of varying loading heights. Accommodation is provided for a spare wheel, complete with a tire, and the equipment is enclosed in a sheet-steel casing with a hinged side panel, and is therefore entirely waterproof. The chassis is provided with two adjustable drop legs at the forward end and with a square thread jacking screw at the rear end to keep the set rigid when in operation. The jacking screw is also capable of lifting the set sufficiently to enable a wheel to be changed.

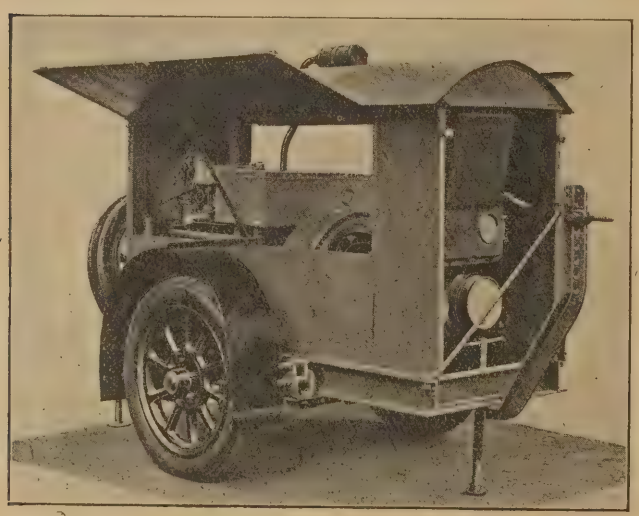

Fig. 2.—Cable Testing Plant.

The generating set consists of an "Aster" high-speed four-cylinder petrol engine, type 43 DMI, developing 12 b.h.p. at 1,500 r.p.m., coupled through flexible coupling to a Crompton alternator, developing 6 kW, 220 volts, 50 cycles. The switchboard consists of an enamelled slate panel mounted on a frame designed to minimise road shocks, and carries a d.p. overload and no-volt circuit breaker with suitable fuses, and an 8-in. dial voltmeter and ammeter; also a back-of-board regulator.

Spares for the engine and alternator, together with tools, are contained in a locker; an oil storage drum and foot tire pump are also provided. The circulating water of the engine is cooled by a radiator mounted in front of the equipment, the fan of which is adjustable for belt tension. The fuel tank is mounted beneath the canopy, the exhaust being led to the silencer mounted on the top of the canopy. The equipment operates in conjunction with special high-pressure apparatus. Amongst other special portable generating sets produced by the company mention may be made of a 30-h.p. self-propelling electric-arc welding set.

A New Fitting Suspension Method.

We have received from MESSRS. FALK, STADELMANN & CO., LTD., Veritas House, Farringdon Road, London, a sample "Holdrite" pendant set, fig. 3. This is a recent production of the firm in which is employed a new method of suspending one-piece glass electric lighting fittings. The suspension device consists of two semi-circular metal saddles sustaining the globe in a lip at the top. The saddles are clamped at the ends, where they are held by a dual chain suspension. The cover which holds the lamp holder and lamp merely rests on the top of the globe, and renders the interior of the fitting nearly dustproof. The "free" cover has the great advantage, when replacing or cleaning the lamp, &c., that it can be handled independently of the globe. The duplex saddle is designed to accommodate the varying flange contours which occur in a given type of fitting, by means of adjusting nuts at the clamping connections. Vibration troubles are guarded against by virtue of the saddles sustaining the globe round the whole of the lip. This also provides for glass expansion, it being unnecessary to clamp the saddle tightly to the fitting. It is claimed that the "Holdrite" method of suspension for heavy globes is the first practical one to be employed without gallery screws, &c.

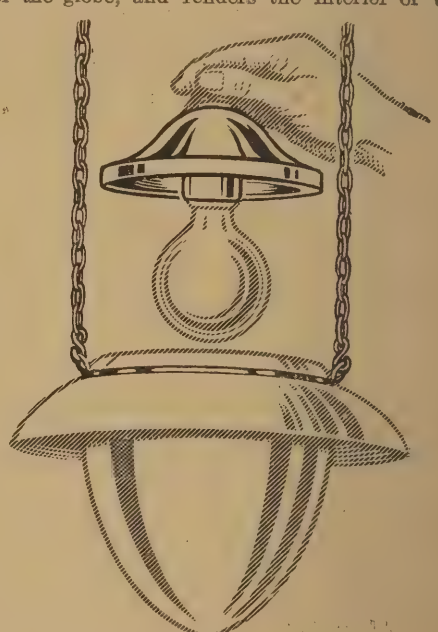

Fig. 3.—"Holdrite" Suspension.

A New Insulating Material.

We have received from THE SILUMINITE INSULATOR CO., LTD., The Green, Southall, Middlesex, some particulars of a new insulating material, "Siluminite, grade 2," which it has recently produced. It consists of a certain silica asbestos base and a small amount of phenol formaldehyde condensation product. It is claimed that this material greatly increases the mechanical strength and electrical insulation, and at the same time produces a finished product which is non-absorbent and capable of withstanding a discharge over the surface for a given period without carbonisation taking place. At the present time the material is made in sheet form in sizes 30 in. by 40 in., with a minimum thickness of $\frac{1}{4}$ in. It is also claimed that at high temperatures softening or change of shape does not take place, blistering is impossible, and that the material is fireproof. A copy of a report on the tests made on two samples of this material at Faraday House shows the specific resistance of a sample (dry), 1.48 cm. thick, to be 4.3×10^6 megohms; also that of the same sample, after 24 hours' immersion in water, to be 1.9×10^6 megohms. Another sample, 1.47 cm. thick, showed a specific resistance of 3.5×10^6 megohms when dry. Breakdown pressure tests gave a result of 27,900 V from the 1.47 cm. sample when dry, and 26,700 V for the 1.48 cm. sample after 24 hours' immersion. In another test a carbon arc was passed along the surface of a sample two or three times, and the insulation resistance was measured between two points of the treated surface with an "infinity" result. There did not appear to have been any carbonisation, nor did the material burn or lose its shape.

The Development of Electric Power Supply.

By R. W. GREGORY.

(*Abstract of the Chairman's Address;* NORTH-EASTERN CENTRE *of the* INSTITUTION OF ELECTRICAL ENGINEERS.)

HAVE often felt that an essential part of a chairman's address ıould be a plea of justification for the continued existence the profession to which he belongs. Throughout the ages, ıe principal justification for the existence of the engineer ıas been that he has made it possible for large numbers of eople to live together more or less healthily in towns and ties. The present trend of engineering appears to be towards ıaking it possible for the rustic to obtain many of the ervices which in the past were only obtainable in the smoke-den air of the city.

I sometimes wonder whether we English are as enterprising people as we like to think ourselves to be. The country ppears to be hampered with a load of existing capital works ıd legal restrictions which in the electrical industry at least revent her from getting on with the business as quickly as ıe ought to. Whatever England does in the practice of ectrical development may have little effect on the rest of ıe world, but a large effect on England herself. The reluct-ıce of our home railways to electrify their main lines may e justified by the economies of the moment, but it is con-ivable that the electrification of British main lines would ave far-reaching effects on our foreign and Colonial trade railway electrification material.

Rural electrification, however, is more within the sphere operation of the electric supply authorities, and deserves ıe study of all supply engineers. The characteristics of rural ads are that they are sparsely distributed and small in ıantity; the capital cost per kW connected must therefore e larger than in the towns and industrial areas, and the sential to the solution of the problem is the reduction of ıe capital cost even at the expense of the service given.

At the recent conference in Newcastle, of the Institute of ritish Architects, sorrow was expressed at the manner in hich Dobson's classic façades had been treated by the men ho worked behind them. I join issue with the architects y saying that they should design their industrial buildings allow signs and letters to be applied so as to enhance the chitectural effect. Those of us who have seen the effect flood lighting on some of the business buildings in other ountries know how electricity and architecture can combine make advertising beautiful. There is an even more im-rtant question to consider than that of night signs in which e should join forces with the architect. The outstanding ıaracteristic of the majority of our industrial towns and ties is their darkness and dinginess and dirtiness. We know the experience of the coal strike a few years ago how fferent our atmosphere becomes if only we eliminate smoke, ıd we know that there are ways and means existing which, generally used, would eliminate 90 per cent. of the smoke hich pours daily from our industrial and domestic chimney acks. For the sake of cleanliness and the health and cheer-ılness of the community, everything should be done to ıcourage the use of smokeless heating systems, of which ere are many available. Gas engineers, electrical engineers, ıd heating engineers together can provide means of heating oth for domestic and public buildings, which do not foul e atmosphere, and the general use of these systems would, am convinced, do more for the general happiness of the mmunity than a dozen Acts of Parliament.

The electric supply industry in Great Britain is at present a state of rapid development, both technically and economic-ly. The economic trend in generating station practice is wards the large station with a plant capacity of the order 200,000 kW and with a site of sufficient area to double is capacity. As the efficiency of the large turbine is vitally pendent upon the vacuum obtained by the condensing plant, is more important to place our generating stations on our tuaries and larger rivers than it is to build them at the al pitheads. Electricity can be economically generated by eam only near a large supply of pure water; for every ton coal burned in an electric light and power plant 400 to 600 ns of water must be pumped to condense the steam that ives the big turbines. The longest distance that electricity n be transmitted economically over wires at present and mpare favourably with local power is 250 miles. The cost generating electricity is only about 20 per cent. of the tal bill, and the other 80 per cent. is the cost of delivering e service from the power plant to the consumer.

The large generating station brings in its wake increasing oblems of control and distribution, and certain branches this side of the electric supply industry have a little diffi-lty in keeping pace with the rapid growth of the generating ation. Generally it can be said that switchgear and cables e the sections which tend to lag, and transformers and erhead transmission lines are the sections which keep pace ith the generating plant. In 1914 the rupturing capacity generating station switchgear was sufficient to cope with short circuit on the station without fault limiting devices; -day it is not. The capacity of the generating plant has own more rapidly than the rupturing capacity of the circuit eakers controlling these plants. The 200,000-kVA station has arrived; the 2,000,000-kVA circuit breaker has not; for the reason that it is rare that the circuit breaker can be tested out as a breaker under service conditions. It is possible now to obtain from most of the reputable manufacturers circuit breakers with a normal rated rupturing capacity of upwards of 1,500,000 kVA. The general trend in the use of such circuit breakers is to limit their duty to a figure well inside their rated rupturing capacity. This is done, first, by so laying out the gear that a short circuit between phases in the precincts of the generating station is practically impossible.

The interest in metal-clad switchgear design has spread beyond this country, and is now world-wide. It is already being manufactured for the American market by Allis Chalmers of Milwaukee, and I don't think I am far wrong in stating that other switchgear manufacturers in America have designs in store ready to meet their almost certain home demand for this type of gear. Could not the larger switchgear manufacturers combine to provide a proving house which is worthy of the industry and the country? The organisation, to make such a venture possible, already exists. The labours of a well-equipped research laboratory would hasten the day when the breaking of an electrical circuit will not be explosive. What are the possibilities in this direction of devices like the automatically variable reactance or even of the thermionic valve?

The art of cable making and cable using is at present in a wonderfully interesting state of development, and the increased knowledge of dielectric phenomena now available has so widened the field of vision of the lead, paper and compound engineer, that he is endeavouring to turn out cables for use at pressures which, in the past, could only be applied to bare conductors hung on insulators.

Power transformer design continues to keep pace with the developments in other sections of the industry. Transformers can be built of capacities equal to that of the largest generators and for use with voltages as high as can be dealt with by the transmission lines. One of the primary problems of transformer design is that of the coiling of the windings to maintain the insulation, which resolves itself into knowing all about the "hot spots" which determine the rating of the transformer.

The oil temperature loading basis is one of great importance to the transformer user. In the largest transformers the heat generated by the losses is extracted from the oil either by water or forced air. A characteristic of the time, however, is the rapid increase in the sizes available of "self-cooled" transformers.

Overhead transmission lines, as now constructed, are remarkably reliable, and the best insulators now appear to possess a reasonable life even under the high mechanical and electrical stresses to which they are subjected. The main enemies to continuous service are birds and lightning. We know of bird troubles in this district, and "crow guards" are an essential part of the construction of our high-pressure lines. In India many of us have heard of delays to service caused by crows building nests on cross arms and pole tops, the nesting material sometimes being the scrap ends of armouring wire left from underground cables being laid in the district. Lightning is still a source of income to the trouble man and to the manufacturer of protective apparatus. The general experience seems to be that the higher the working pressure of the line the less liable it is to lightning troubles. Lines of over 100,000 V working pressure are practically immune from lightning troubles. It is uneconomic, however, to insulate all lines and the apparatus connected to them for this pressure, so the lightning problem resolves itself into the protection of the line insulators against destruction from arc-overs, and the protection of the insulation of the apparatus connected to the line. The protection of the apparatus connected to the line is obtained more or less successfully by the use of lightning arresters of many types, the best known of which are the electrolytic and the oxide-film arresters which act as safety valves against over-potentials. The wider knowledge of high-frequency phenomena now available from radio research and experience also helps in the attack on this problem, and it is probable that lightning and surge protection will ultimately be achieved by apparatus connected directly in the line, which will absorb the energy of the surge before it reaches the apparatus to be protected, and without any power current leaking to earth; that is, the line will not be shut down even temporarily when under the influence of lightning. The Campos arrester, well known in Italy, and the Grant surge absorber described by Captain de Ferranti at the recent Paris Conference are examples of this type of protective gear. The problem of the day, however, in this country, is not the construction of first-class, high-grade, high-pressure lines, but the construction of cheap high-pressure distribution lines which would enable the supplies to be given economically to farms, villages, and sparsely-loaded districts. The use of conductors of high tensile metals such as steel and silicon bronze in place of copper

or aluminium helps a little towards cheapening the lines. We, of course, have to remember that cheap overhead distribution as carried out in America is constructed to what might be termed agricultural engineering standards.

There has been much said recently on the desirability of easing the various regulations and restrictions which govern the construction of British overhead lines. These regulations and restrictions certainly do keep up the cost of our high-pressure overhead lines, and reasonable proposals for their modification are worthy of consideration by the authorities. The cost of rural high-pressure overhead lines could be considerably reduced if the figures for ice loading specified in the regulations were modified.

For transmitting quantities of power, overhead lines are less than half as costly as underground cables. The engineering difficulties of laying cables are increasing with the use of higher pressures and with the heavier and more elaborate road construction now required for modern traffic.

Probably the most notable development during the last few years is the automatic converter sub-station which has been made possible by modern improvements in the design of rotary converters and protective and control gear for them. It is now possible to obtain commutating machines which are practically unaffected by dead short circuits on their terminals. It is now generally accepted that a properly designed automatic sub-station, because it eliminates many of the chances of human error, which occur particularly at critical times, is more reliable in its service than a manually operated sub-station, and its employment can be economically justified, not only in districts where the standard of intelligence and the wages of the sub-station attendants are high, but also in districts where the standard of intelligence and the wages of the sub-station attendant are low; for example, the automatic sub-station is commercially and technically sound both in America and India.

The long-tried and popular rotary converter has, during the last few years, received a challenge from a new rival—the mercury arc rectifier. At the present time the capital cost of a rectifier installation is not less than that of a rotary converter installation to do the same duty, and its claims for justification can only be based on such factors as efficiency, simplicity, and reduced maintenance costs. Whether these factors are sufficiently strong to eliminate the more tried out, old-established rotary converter for railway work, it is perhaps too early to say at the present time.

Legal.

Alleged Radio Valve Theft.

At Nottingham, on October 25th, E. Morris was committed for trial (bail being allowed) on a charge of stealing radio valves valued at £158, the property of the General Electric Co., Ltd., Nottingham. F. S. Freeman and J.C. Baker were also committed on a charge of receiving the valves.

Postmaster-General v. Ford.

At the Marlborough Street Police Court, on October 28th, the Postmaster-General (represented by Mr. Percival Clarke) summoned Mr. R. M. Ford, Albert Gate, S.W., for having installed and worked a radio receiving set without a licence. In reply to Mr. Hay Halkett, the magistrate, the defendant said that it would be a long case, but the prosecution could not agree that this was necessary. Mr. Ford said that he had a long statement to make involving many considerations, and the case was adjourned until November 12th.

Tucker v. Wandsworth Manufacturing Co., Ltd.

In the Court of Appeal, consisting of the Master of the Rolls and Lords Justices Warrington and Sargant, on October 28th and 29th, this case was heard upon the appeal of the defendants from the judgment of Mr. Justice Tomlin, holding that the appellants had infringed Mr. John Bristow Tucker's patent for improvements in electrical switches, No. 186,408 of 1923.

The first claim in plaintiff's specification was for a switch with quick-make and quick-break action by virtue of a compression spring pivotally operating, on the one hand, on a contact arm and, on the other, with an operating member, which was utilised for positively displacing the contact arm in the operations both of making and breaking in the event of the spring failing to act or to act effectively. The second claim was for a specific tumbler switch, though the inventor did not limit his invention to any particular form of switch.

Mr. Tucker alleged that the defendants had infringed both the claims. The defendants denied infringement, and alleged that the plaintiff's patent was invalid by reason of prior specifications, prior user, and common general knowledge.

Mr. Justice Tomlin held that the plaintiff's first claim was not valid, but that the defendants' switch was an infringement of the plaintiff's second claim.

The proceedings in the lower Court were reported in our issues of July 10th (p. 53); July 17th (p. 119); and August 7th, 1925 (p. 238).

Sir A. Colefax, K.C., and Mr. Courtney Terrell appeared fo the appellants; and Mr. Whitehead, K.C., and Mr. Morri for the respondent.

Sir Arthur Colefax contended that there was no subje matter for a patent with regard to the plaintiff's second clai having regard to general common knowledge, and that th judgment of Mr. Justice Tomlin was wrong in that respec and that the appellants were entitled to succeed.

Mr. Whitehead, for the respondent, supported the decisio of Mr. Justice Tomlin. He contended that there was inve tion in what the patentee had done. He said it was necessar to devise a switch which would be certain and quick in i operation in order to prevent arcing. The patentee ha counsel submitted, solved a new problem. The evidence w that tumbler switches had been made for 30 years. Th respondent had been making them for about 25 years, an the defendants had been making them since 1904. If re spondent's claim 2 was to be broken at all and held to b invalid it would have to be on the grounds of want o subject matter. To succeed on that the defendants mu prove that what the patentee had done was obvious havin regard to the state of the art.

Lord Justice Warrington said that the respondent did no say or pretend to say that he had solved any special proble of tumbler switches.

Mr. Whitehead replied that he had claimed a tumbl switch which he had described and illustrated, and no othe In claim 1 he had said too much, with the result that M Justice Tomlin had found that the claim was invalid. H (counsel) contended that neither Cox, Rose, nor Crabtree ha anticipated the problem which the respondent had succeede in solving.

At the conclusion of the arguments their Lordships allowe the appeal.

The Master of the Rolls, in giving judgment, said th action was brought to establish that there had been an in fringement by the defendants of the plaintiff's patent, an to obtain an injunction and damages. Mr. Justice Tomli had held with regard to claim 1 of the plaintiff's specificatio that the patent was invalid, but that claim 2 was a vali claim, and that he (the Judge) could exercise his discretio under the Patents Act, 1919, and allow an amendment b striking out claim 1 and holding that the plaintiffs coul obtain an injunction and damages.

Dealing with the plaintiff's amended specification, his Lor ship said that claim 1 was admittedly a wide claim. Th patentee indicated that the tumbler switch was an embod ment of his invention but not the sole object of his inventio Mr. Justice Tomlin, upon the evidence, came to the co clusion that plaintiff's first claim could not be limited t tumbler switches, and he (the Master of the Rolls) agree with him. With regard to claim 2 the Court had to giv effect to the whole body of the specification and the illustra tion. The claim was not for a "tumbler" electric switch but for an "electric switch substantially described as herei set forth and illustrated." He thought the claim was a wid claim and not a narrow one. Mr. Justice Tomlin had hel that claim 1 had failed for want of subject matter and novelty and he (the Master of the Rolls) thought that claim 2 faile for a like reason. Accordingly he thought it was impossible t hold that claim 2 was valid. In his opinion the appeal mu be allowed and judgment given for the defendants with th costs of the action and the costs of the appeal. If it ha been necessary to decide the question of infringement h would have felt some difficulty in holding that there had bee any infringement by the defendants.

The other members of the Court delivered judgment t the same effect.

Attorney-General v. Southern Counties Electric Light an Power Supply, Ltd.

This action came before Mr. Justice Tomlin in the Chancer Division on October 27th for judgment in default of defenc

Mr. Wilfrid Hunt, for the defendants, however, applied fo an adjournment. He said that a mistake had been mad The defendants had a defence but it had not been delivered i time. If, however, his Lordship would not adjourn the cas he could deliver a defence immediately.

His Lordship said he would give the defendants a week he could not enter judgment for the plaintiff when there wa a defence to the action.

The action was at the relation of the Battle (Sussex) Urba Council for an injunction restraining the defendants fro breaking up Battle High Street or any other road or path s as to cause obstruction or damage.

German-American "Bosch" Litigation.

The hearing of this case, the opening of which was reported i our last issue, was resumed on October 27th, when Counsel o both sides read the evidence on which the Registrar gave hi decision.

His Lordship asked if there was any evidence that Bosc magnetos were made in England.

Sir A. Colefax said there was evidence that during the wa some magnetos were made in England and stamped "Bosch in England.

His Lordship: Were they made by a firm in which Rober Bosch was interested?

Sir A. Colefax said that 700 were made by the then English company in 1915.

Mr. Arthur T. Murray, president of the American Bosch Magneto Corporation, was called, and gave evidence of the export from American to this country of motor-cars equipped with their magneto. Cross-examined by Sir Duncan Kerly, K.C., for the German company, witness said the general practice in America was to use battery and coil ignition. The presence of a magneto on an American car was unusual except in cars for export.

Counsel suggested that the result of all the importation of American Bosch magnetos into this country either as separate articles or on cars only amounted at most to a few thousands, and that it was wholly negligible in comparison with the Stuttgart trade.

The witness replied that during the last five years 60,000 electrical units had been imported with his company's name on them. In reply to Counsel, witness said that "electrical units" did not mean sparking plugs, but batteries, distributors, coils, &c.

The hearing was adjourned and was resumed on October 30th, when his Lordship said it was plain that for years in this country the American corporation had advertised its own manufactures as "Bosch." It sent thousands of batteries and ignition coils and magnetos all stamped "Bosch."

Sir D. Kerly, K.C. (for the German company): Stamped "American Bosch."

His Lordship: What could anybody suppose it meant; it does not mean German Bosch.

Sir D. Kerly: I will suggest that.

Herr Otto Heinz, on behalf of the German company, in reply to Sir D. Kerly, said that in his view a genuine "Bosch" in this country was the product of his company.

As to what it is in America you are engaged in litigation there?—Yes.

The hearing was adjourned until November 3rd.

Radio Instruments, Ltd., v. Plating & Co.

Mr. Justice Romer, in the Chancery Division on October 30th disposed of a motion by the plaintiffs against Plating & Co., Northampton, for an injunction restraining infringement of a licence under a patent for radio transformers.

Mr. Shelley, for plaintiffs, said it had been agreed by defendants that there should be a perpetual injunction, and an order for the payment of taxed costs and an inquiry as to damages.

Radio Instruments, Ltd., v. A. J. Hewens & Sons.

Mr. Justice Romer, in the Chancery Division on October 30th, had before him a motion by the plaintiffs for an injunction restraining A. J. Hewens & Sons, High Street, Lewisham, from infringing a limited licence under a patent for radio transformers. Counsel for plaintiffs said defendants had agreed to submit to a perpetual injunction and to pay the taxed costs of the motion and an agreed sum by way of damages.

Nettleton & Co., Ltd., v. Dawes.

In the Mayor's and City of London Court, on October 29th, before Judge Shewell Cooper, a claim was made by Nettleton and Co., Ltd., advertisement contractors, 126, Moorgate, E.C., against Mr. J. W. Dawes, wireless dealer, Finsbury Park, for £13 due under a contract for an electric sign placed on an electric light standard. The defendant pleaded that the sign was not in accordance with the contract and judgment was entered for him, with costs.

Brown, Douglas & Co. v. Enfield Ediswan Cable Works, Ltd.

Mr. Justice Finlay, in the King's Bench Division, on October 30th, had before him an action brought by Messrs. Brown, Douglas & Co., Export agents, Eastcheap, E.C., against Enfield Ediswan Cable Works, Ltd., claiming damages for alleged breach of two contracts. Defendants denied plaintiffs' allegations, and disputed the claim. Mr. Wingate Saul, K.C., and Mr. T. Beresford were for the plaintiffs, and Mr. Barrington Ward, K.C., and Mr. Cartwright Sharp for the defence.

Mr. Wingate Saul, for the plaintiffs, said that one contract was for the supply by the defendants of fifty miles of 1/18 S.W.G. single core cable at £13 15s. per mile, and the other for ten miles of 1/18 S.W.G. single core cable at £13 10s. per mile, the former contract being dated July, 1920, and the second contract January, 1921. The cable was for shipment to New Zealand, of which defendants knew. Defendants in their defence said there was no breach of any of the contracts, because the goods supplied were in accordance with the contracts. They pleaded that there was a clause in the contracts to the effect that the defendants in the case of defective material or workmanship were not to be liable for consequential damages, and that their only liability was to replace the goods. In the correspondence his Lordship would see that the plaintiffs offered to return the goods to the defendants, but the latter refused to accept them. The only difference in the specifications was that the first cable was described as "Non-Association" quality, and the second cable as "Association." The cable was required to have a minimum insulation resistance, and it was in that respect that the cable failed to be in accordance with contract. The claim did not relate to the whole of the cable as some was sold in New Zealand, where it had been shipped, before the results of the tests there were known, and some of the cable had been used for tests. The remainder of the cable, less that which had been sold and used for tests in New Zealand, was sent back to England. Tests were also made in England, and of fifteen coils of the "Non-Association" cable four were below the minimum of 2,000 megohms per mile, and eleven satisfied the minimum, and of twelve coils of the "Association" exactly fifty per cent. were below the minimum of 2,000 megohms per mile.

Mr. William H. Ballantyne, B.Sc., gave evidence as to the results of tests applied to certain coils and said that they were not up to standard. He did not think the rubber on the cable was perished by having been stored too near the boilers on ship. It did not bear the appearance of having been overheated in that manner. Some coils were bad, but other coils were much above the standard required.

The hearing was adjourned until November 2nd.

Metropolitan-Vickers Electrical Co., Ltd., v. British Thomson-Houston Co., Ltd.

In the Court of Appeal, consisting of the Master of the Rolls and Lords Justices Warrington and Sargant, on November 2nd, the hearing was commenced of the appeal of the plaintiffs in this case from the judgment of Mr. Justice Lawrence in the Chancery Division, delivered on December 18th last year (*vide* Electrical Review, December 26th, p. 971).

The plaintiffs, the owners of Letters Patent No. 9,644 of 1912 of an invention of "Improvements relating to synchronous dynamo-electric machines," granted to Emanuel Rosenberg, brought the action for an injunction and the usual ancillary relief, alleging that the defendants had infringed the patent by the manufacture, sale and use of rotary converters constructed in accordance with the plaintiffs' specification. In particular the plaintiffs complained of the sale towards the end of the year 1923 by the defendants to the West Hartlepool Corporation of two 300-kW rotary converters.

The plaintiffs accordingly claimed an injunction to restrain the defendants from infringing their letters patent; damages or an account of profits; and delivery up or destruction on oath of all infringing machines in the defendants' possession or control.

The defence was a denial of infringement or a threat to infringe, and a plea that the plaintiffs' letters patent were invalid upon the grounds of prior publication and prior general knowledge. They pleaded that the plaintiffs' patent was bad for want of subject matter.

Mr. Justice Lawrence dismissed the action, and directed that the defendants should have the general costs of the action and also the costs of the issues raised by the particulars of objections, and the defendants were ordered to pay to the plaintiffs the costs of the issue raised by the particulars of breaches.

Sir Duncan Kerly, K.C., Mr. Whitehead, K.C., and Mr. McEwen attended for the appellants; and Sir Arthur Colefax, K.C., Mr. Trevor Watson, and Mr. Sandeman for the respondents.

Sir Duncan Kerly, in opening the proceedings, explained in great detail the invention of Rosenberg as disclosed in his specification.

Bartholomew v. Electrical Distribution of Yorkshire, Ltd.

At the Rotherham County Court recently, Thomas Bartholomew, Rotherham, sued the defendants for £35 damages. For the plaintiff it was stated that the company's workmen left a shallow trench across a roadway at Maltby. A car owned by the plaintiff passed over this and the back axle was broken. In reply to questions plaintiff said that the car was 15 years old and that it was bought for £25. The case was adjourned.

Aerodrome Lighting.—The installation of a system to enable aircraft to land safely in fogs has just been started at Croydon, the London air station. According to the *Daily Mail*, in parallel lines across the aerodrome trenches are being dug and in these neon light-tubes are to be sunk. This form of light, with its brilliant reddish hue, effectually penetrates fog. Above the lights, and flush with the ground, there are to be thick plate-glass covers, so that aeroplanes can taxi over them without damaging the glowing tubes beneath. Between the light-tubes there is to be laid a section of leader cable. After being guided by directional wireless to the aerodrome, the airman, flying through fog, will pick up the leader-cable and follow it round and round, gradually reducing his altitude till he catches sight of the lines of neon lights and is able to land.

French Electrical Conference.—The Société Française des Electriciens has during the current week held a conference. Among the subjects included in the scheduled programme were "Coefficients of Deformation of Alternator Curves," "Putting Synchronous and Asynchronous Machines in Short Circuit," "Definitions and Measurements of Coefficients of Loss and Reactances in Alternators," "Phase Compensation in A.C. Installations," "The Lighting of Works and Schools," "Motor Headlights," "Traction by Accumulators," and "Rural Electrification."

Trade-mark Applications.

THE following are among the recent applications for British trade marks. Objections against any of the proposed marks may be lodged within one month from October 28th. In the case of foreign applications, the names and addresses of the British representatives are also given.

N. & K. (lettering and design). No. 447,816. Class 8. Radio-telephonic apparatus.—Neufeldt & Kuhnke, Kiel, Germany. (L. J. Hydleman & Co., 32, Queen Victoria Street, E.C.4.)

Flor (lettering and design). No. 458,318. Class 8. Electric accumulators and parts.—La Société des Accumulateurs Tudor, 60, Chaussée de Charleroi, Brussels. (Marks & Clerk, 57-58, Lincoln's Inn Fields, W.C.2.)

Radiolux-Amplion. No. 461,384. Class 8. Scientific and philosophical instruments and apparatus for useful purposes.—E. A. Graham, trading as Alfred Graham & Co.

Guarding the Pole—the Polar F Light Best Yet Made (lettering and design). No. 460,183. Class 8. Electrical dry cells.—Thomas Henrik Poulsoon, 43, Dronningensgade, Stavanger, Norway. (Phillips', 70, Chancery Lane, W.C.2.)

Hetroflex. No. 461,565. All goods in Class 8.—A. S. Cheetham, 3, Vernon Road, Edgbaston, Birmingham.

Wind design only. No. 461,624. Class 8. Instruments and apparatus for use in connection with radio-telegraphy and telephony.—Consulting and Radio Service, Ltd., 15, Gordon Street, Glasgow.

Nick-o-Time tunometer. No. 462,009. Class 8. Variable inductances.—M. E. Elliott, The Thistles, Kemps Lane, Beccles.

Prodonite. No. 462,418. Class 8. Detector crystals for use in radio-telegraphy and telephony.—S. B. Smith & Co., Ltd., 10, Savoy Street, Strand, W.C.2.

Ino (lettering and design). No. 460,049. Class 13. Electric lamps (ordinary).—Ino Guarantee Lamp Co., Ltd., 35, Aldermanbury, E.C.2.

Elektrolox. No. 460,957. Class 18. Refrigerating chambers and refrigerating plant.—Elektrolox Aktiebolaget, 2 Norrmalmsstorg, Stockholm, Sweden. (Haseltine, Lake & Co., 28, Southampton Buildings, W.C.2.)

Published Specifications.

Compiled expressly for this journal by Patent Agents.
The name of the applicant's patent agent, if any, will be found on the printed specification.
The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

1924.

8,341. "Method of winding for the improvement of the commutation in electric machines provided with commutators." Compagnie Electro-Mécanique. April 16th, 1923. (214,601.)

8,766. "Multiple-wave acoustic apparatus." Signal Ges. May 14th, 1923. (216,105.)

9,145. "Two-way telephonic and telegraphic repeater for use without balancing networks." A. W. Adams. April 10th, 1924. (240,680.)

13,621. "Electrical resistance." A. Dilger and Dubilier Condenser Co., Ltd. June 4th, 1924. (240,890.)

14,128. "Contacts for use in electrical apparatus." Western Electric Co., Ltd. (Western Electric Co., Inc.). June 11th, 1924. (240,895.)

14,184. "Electric driving mechanism for weaving, knitting, and like machines." Siemens-Schuckertwerke Ges. August 23rd, 1923. (220,931.)

14,366. "Control of electric motors." E. J. Ondoli. June 13th, 1924. (240,897.)

15,463. "Apparatus for the reception of wireless signals." N. Lea and Radio Communication Co., Ltd. June 26th, 1924. (240,899.)

15,995. "Screw-plug electric fuses." Siemens-Schuckertwerke Ges. December 13th, 1923. (226,155.)

15,996. "Non-interchangeable electric fuses." Siemens-Schuckertwerke Ges. December 14th, 1923. (226,156.)

16,199. "Means for correcting or minimising distortion of signals in electric telegraph systems." H. V. Higgitt and Eastern Telegraph Co., Ltd. July 5th, 1924. (240,906.)

16,273. "Manufacture of electron-emitting material and apparatus." A. S. Cachemaille (Westinghouse Lamp Co.). July 7th, 1924. (240 909.)

16,328. "Automatic cut-out for use with electrically-heated appliances." G. H. Collins and H. F. Collins. July 8th, 1924. (240,910.)

16,427. "Variable resistances for wireless and other purposes." H. Ingham and H. Clarke & Co. (Manchester), Ltd. July 9th, 1924. (Cognate application, 9,462/25.) (240,917.)

16,492. "Electron valve holders." Burndept, Ltd., L. J. Hunt, and C. F. Phillips. July 9th, 1924. (240,918.)

16,499. "Portable electrocardiographs and the like apparatus." H. E. Nichols and C. H. Chase. July 9th, 1924. (240,919.)

16,513. "Method of and electronic valve for modulating electric currents." E. T. Fisk. July 9th, 1924. (240,920.)

16,716. "Electrically-driven high-speed spindles applicable for use with woodworking machines." A. Ransome & Co., Ltd., and P. S. Robinson. July 11th, 1924. (240,927.)

16,936. "Adapters, connectors, or the like for lamps or other appliances employing electric current." A. J. Jung. July 15th, 1924. (240,937.)

17,611. "Electrodes for electric discharge tubes." General Electric Co., Ltd., and A. C. Bartlett. July 23rd, 1924. (240,944.)

17,670. "Means for bridging terminals of an electric circuit." J. Sutter. July 24th, 1924. (240,946.)

17,840. "Method and apparatus for measuring distance and time intervals, and more particularly for acoustic depth sounding." Submarine Signal Corporation. December 22nd, 1923. (226,489.)

17,966. "Induction couplers or high-frequency transformers." Igranic Electric Co., Ltd., and A. H. Curtis. July 28th, 1924. (240,953.)

17,980. "Apparatus for supplying high-frequency alternating electric current from a low-frequency source." Westinghouse Brake & Saxby Signal Co. (Union Switch & Signal Co.). July 28th, 1924. (240,954.)

18,463. "Electric radiators." Hotpoint Electric Appliance Co., Ltd., and F. W. Leevers. March 6th, 1925. (240,962.)

18,469. "Electric discharge tubes having more than three electrodes." H. Wade (Naamlooze Vennootschap Philips' Gloeilampenfabricken). August 1st, 1924. (240,963.)

18,673. "Construction of rotor conductors for induction motors." J. Lea. August 6th, 1924. (240,967.)

18,808. "Dynamo-electric machines." J. A. Kuyser and Metropolitan-Vickers Electrical Co., Ltd. August 7th, 1924. (Addition to 220,362.) (240,971.)

20,343. "Electric switches." J. A. Crabtree. August 28th, 1924. (240,980.)

20,381. "Means for recharging an accumulator in apparatus requiring supplies of current." L. Barrett. August 28th, 1924. (240,981.)

20,496. "Electric switches." Cable Accessories Co., Ltd., F. H. Reeves, and A. Crawford. August 30th, 1924. (240,982.)

20,585. "Dial indicators for radio instruments." Igranic Electric Co., Ltd., A. H. Curtis, and G. F. Dandridge. September 1st, 1924. (240,983.)

22,933. "Electric condensers." Dr. H. Meusser. September 29th, 1924. (Convention date not granted.) (222,507.)

23,243. "Electric contacts." Siemens Bros. & Co., Ltd., and H. E. Humphries. October 1st, 1924. (240,996.)

Steam Generation on "Coal Site."—We have received some particulars of an extremely interesting event which recently occurred at the Barnsley electricity works. Some months ago it was arranged to construct an ash tunnel in the boiler house immediately under the "Bennis" chain grate stoker equipment of one of the boilers. The work of excavation had not been long in progress before a seam of useful coal, 1 ft. 8 in. thick, was uncovered. Twenty tons of coal were removed from immediately beneath the stoker into which it was fed direct, thus providing fuel for several hours' run.

Electricity Supply in the London District.

THE inauguration of the new Joint Electricity Authority for the London and Home Counties Electricity District on Wednesday last week was, in the words of Sir John Snell, "an historic occasion," to which the newly elected chairman, Mr. Duncan Watson, referred as "the dawn of a new era that . . . will confer incalculable benefit upon the 8¼ millions of people in Greater London." We sincerely hope that these words will be justified by the event. London for a generation has awaited the reforming hand which shall bring order out of chaos and resolve the welter of discordant systems into one grand harmony; to Mr. Watson has fallen the lot of leader for the first three years of the campaign, and we heartily congratulate him on the honour conferred upon him by his 32 colleagues. We trust that under his guidance the Joint Authority will receive its initial impetus in the right direction, and that his successors will keep the ball rolling till the goal is won.

He will not, however, find the game all play and no work—nor would he wish it so, accustomed as he is to delight in a tough set-to; he is the captain of an ill-assorted team, the members of which have yet to learn to play for the side and not for their own ends. The problem of London's electricity supply bristles with vested interests, both company and municipal, to an even greater extent than that of any other area in this country, where possession seems to comprise 99 points of the law. The companies have made a good bargain with the London County Council; the municipal authorities have not yielded an inch, and there is—as yet—no power to compel them to do so, save the control over extensions wielded by the Electricity Commissioners, which has been exercised so far with remarkable restraint, except in the case of minor undertakings. *The parochial spirit still dominates the whole field of electricity supply.* This is none the less true because we see many undertakings reaching out to supply larger and larger areas, adding unto themselves acre after acre—that is good practice inasmuch as it makes for economy, but it is by a development and expansion of the same spirit that it is prompted.

Heartily therefore do we welcome Mr. Duncan Watson's declaration from the chair of the London Authority: "Hitherto, largely owing to our ultra-parochial and insular policy, electricity supply has developed into a complicated and chaotic condition which has no parallel. There has also existed a clashing and conflict of interests not merely between one section and another, but actually within representative sections, resulting in much misunderstanding, and not a little prejudice. From to-day this must go. Every barrier must be swept aside."

These are brave words; but they show the right spirit. It rests with Mr. Duncan Watson to convince his colleagues of their truth and wisdom. He will have a hard task, as he well knows; he will need all the courage and firmness with which he is credited, and he has our best wishes for his success in a great undertaking.

A Slight upon the Technical Press.

The inauguration of the most important Joint Electricity Authority in the country—the only such Authority that is in full operation at present, for the North Wales and South Cheshire J.E.A. has delegated its supply powers to the North Wales Power Company—might reasonably be regarded as a ceremony at which the electrical Press would be represented. The event is certainly of interest to its many thousands of readers, at home and abroad, not only in respect of its particular bearing upon the future welfare of one-fifth of the population of this country, but also in its more general aspect as one of the most important achievements of the Electricity Commissioners.

Nevertheless, whilst the lay Press was represented at the inaugural meeting of the London Authority, the technical Press was neither invited to send representatives nor even informed that the meeting was to take place.

Next Year's Wireless Exhibition.

We have received several further communications respecting the subject of too many wireless exhibitions since we expressed the opinion (Electrical Review, October 23rd, p. 643) in favour of the holding in 1926 of only one exhibition, and that open to all British manufacturers. Two of the communications before us support the idea of a single exhibition. Mr. J. Scott Taggart, of *The Wireless Dealer*, has received communications to the same effect from many in the trade, and some of his correspondents have given definite promises to take stands "at any exhibition we may be forced to promote to overcome a possible deadlock." He feels, as we do, that the time has come when manufacturers should realise that it is in the best interests of the industry that both N.A.R.M.A.T. and non-N.A.R.M.A.T. members should join hands in one big display, but we have no information regarding circumstances which can create a "possible deadlock" requiring him to promote an exhibition. The second communication is from a firm who announce their intention to hold an exhibition open to all during next autumn. They have been responsible for, or associated with, various wireless exhibitions at the White City, the Albert Hall, and at Manchester, and they invite all sections of the British industry to support a movement which would be held on the broad lines of the Motor Show, and which would be conducted on a co-operative basis in respect of the profits accruing. Messrs. Bertram Day & Co., Ltd., from whom this letter comes, say that trade publications consider it essential that an "impartial organisation" should arrange for the exhibition, and they disclaim any partiality "to any particular body, section, or publication."

We are faced therefore at the moment with the threat of two exhibitions next year, each promoted by a party which is convinced that what the industry needs is one big show! It may seem to be early to talk about what will happen in the autumn of 1926, but it is not too soon for firms who are interested in the trade to express themselves emphatically against duplication. We hold no brief for either party. We hope that the industry itself will find it possible to decide between the two Richmonds who are in the field. If it does not do so promptly we may have two and perhaps more wireless exhibitions in London next year.

The Progress of E.D.A.

As the result of the special efforts that have been made since the last annual meeting of the British Electrical Development Association, the permanent annual income from electricity supply members has been considerably increased. Between fifty and sixty new members from this department of the industry have been enrolled, and the new income thus secured, together with the additional contributions from authorities already subscribing, has more than trebled the supply quota of the total revenue of the organisation. There is, of course, still room for substantial improvement so that the movement may become that big affair that the future of electricity requires and fully justifies. The sum now guaranteed, however, is sufficient to enable the Council and its director, Mr. Beauchamp, and staff, to push on with their larger operations. It of necessity follows that the handling of a larger volume of material and the general increase of work have involved some adjustment of, and additions to, the *personnel*. It will be agreed that the strengthening of the staff by the appointment of an official to take charge of the accountancy side of operations was a desirable proceeding. That has been seen to, and the preparation of Press and advertising matter has been placed under the supervision of Mr. Lovelace, whose experience in advertising publicity will doubtless form a valuable accession, especially as a National Electrical Advertising Campaign is to be one of the more prominent activities of the Association during the coming months. Mr. V. W. Dale will continue to act as Business Manager, but the changes will release him for more direct action in co-operation with his Chief. Very shortly the Press campaign of the winter months will be in full swing, a large number of newspapers and periodicals being chosen as the vehicles for conveying to the public mind the appropriate story of what electricity can and cannot do.

The North Wales Accident.

The whole country has read with the deepest regret the story of the breakdown of a storage dam belonging to the North Wales Power Company, and its disastrous consequences, of which by far the most deplorable was the loss of 16 lives, including women and children, under terrifying conditions. It was indeed forutnate that the village of Dolgarrog was not in the direct line of the raging torrent of three million tons of water which rushed down the hillside—otherwise the death-roll would have been very heavy.

Nature's gifts of energy are not to be harvested like crops from the fields without the exaction of a toll of life and limb; our coal mines from time to time have been the scenes of catastrophes, none the less terrible because of their familiarity, but we have hundreds of mines and very few large water-powers, so that the spectacular failure of a dam exercises the imagination even more vividly than an explosion in a coal mine.

From the material point of view, the damage fortunately appears to be less serious than the earlier reports implied, and the fact that one generator at Dolgarrog was running a few days after the accident indicates that the power station was not badly injured. Mr. Theodore Stevens, M.Inst.C.E., who has visited the spot, communicates his observations on another page of this issue, and from these it seems possible that the lower dam will be made good within a few weeks. The condition of the Eigiau dam will doubtless call for serious consideration, for though the dam itself is intact, it will be useless until the soundness of the foundation is ensured. In the meantime the supply of electricity to the many towns concerned has been restored by various expedients.

Notes from New Zealand.

(From Our Own Correspondent.)

Storage Battery Tramcars.

Gisborne, N.Z., the leading city on the east coast of the North Island, decided in 1913 to go in for a system of storage battery tramcars; the experiment was watched with interest by other cities and towns, but the undertaking was run at a loss for a number of years. The cause of the loss was not suspected until Messrs. Vickerman & Lancaster, engineers, of Wellington, made an examination on behalf of the municipality, and their report just received should prove of great assistance to the Gisborne people in placing their tramway system on a thoroughly sound business footing.

At present the tramway system in Gisborne consists of only a few miles of track laid on the main thoroughfares, and it just fails to accommodate the potential passenger traffic located in three of the most populous portions of the city and its suburbs. The engineers recommend that extensions be added to the present track system to overcome this drawback, and also a general speeding up of the existing service. It is considered that the adoption of these proposals will put the tramway system on a very strong footing.

The interesting point in connection with Gisborne's tramcars is that they are the only storage battery cars operating in any part of the world under the authority of a municipality. The engineers have now recommended their retention, being of the opinion that they are cheaper than either the standard or the railless trolley type, and practically as cheap as either the petrol or the battery 'bus. It will be interesting to watch the new developments with the storage battery tramcars under the more favourable conditions.

Electric Milking Plants.

The chief engineer of the Franklin Power Board, N.Z., recently presented in a report to the Board the following scale of charges for milking installations:—100 cows, 2-h.p. motor, 6-cow plant: £27 to £30 per annum. 75 cows, 2-h.p. motor, 4-cow plant: £24 to £26 per annum. 50 cows, 2-h.p. motor, 4-cow plant: £21 to £24 per annum. 30 cows, 1½-h.p. motor, 3-cow plant: £14 to £17 per annum. 20 cows, 1-h.p. motor, 2-cow plant: £12 to £14 per annum.

The prices include water pumping and separating, but the actual cost in each shed was fixed according to the time taken to milk and the type and running condition of the plant.

Milking by electricity is becoming quite a feature of the New Zealand dairying industry, and the progress of reticulation is bringing into this field a rapidly growing number of electrically-driven milking plants. The Central Power Board operating in Hamilton and the Waikato dairying district reported at a recent monthly meeting that an addition of 408 milking motors had been registered. A similar condition of things is also reported from other Boards, especially in those districts where sub-stations have recently been erected.

New Zealand's Hydro Minister on the Government's Hydro-electric Policy.

At the recent function in connection with the inauguration of the Orua Power Board's sub-station at Bunnythorpe, the Hon. J. G. Coates, Minister of Public Works, outlined the Government's policy in connection with hydro development. He pointed out that the narrow and nearer view was not the one most calculated to conserve the best interests of consumers. The sooner New Zealand could secure favourable prices in the world's markets, the sooner would foreign capital invest in the country, and sound hydro development made this condition of things possible by cheapening the costs of production.

The Minister stated that the taxpayers' money had been invested in hydro schemes, and he meant to see that these investments bore a rich harvest of profit for the general public. It would be the duty of the Power Boards to see that no further rates were struck after the rate for the security of the loans had been levied. The Minister was satisfied that the Government had adopted the right policy in forming the Power Board scheme, and he looked to the Boards themselves to run the hydro industry in the interests of the consumers.

Auckland's Power Plant.

Recently the Auckland Power Board held an official reception at its power station at King's Wharf for the purpose of enabling the general public to view the extent of the Board's undertakings. The function was a great success, and was attended by the Minister of Public Works and other prominent persons.

The power station consists of four 5,000-kW and one 3,000-kW sets, including the original 5,000-kW set which was installed at the inception of the station. The aggregate capacity is stated at 25,000 kW, while the present load is given at 15,000 kW. It is anticipated that the next winter peak load will reach 18,000 kW.

Reticulation is proceeding apace, but there is still a very large number of houses to be connected. The actual consumption of power per house has been calculated at 20 kWh per month, and on this basis reticulation of each additional thousand houses only involves an extra 500 kW per day on the main load. The heaviest item before the Auckland Power Board at the moment is the replacement of portions of the heavy city mains, which have developed faults as a result of overloading as well as other causes, and the introduction of the heavier cables will be proceeded with as soon as the necessary material comes to hand. The estimated profit of the Board for the past twelve months was £13,000.

Lake Coleridge Record Overload.

The growing popularity of electricity is nowhere better exemplified than in the case of the Lake Coleridge plant supplying the city of Christchurch. The nominal capacity of the plant is 12,000 kW, but the maximum overload capacity is estimated at 15,000 kW; for several weeks past the load has been in excess of the normal capacity. The heavy tax upon the capacity of the plant is having the effect of spurring on the duplication works, which, it is said, will only meet the requirements for a limited period. No doubt the progress of reticulation will be retarded to some extent as a result of the present heavy tax on the capacity of the existing plant, and every effort will be made to persuade the Government to sanction the erection of one or other of the secondary schemes in the general report—probably the Waimakariri project at either the Gorge Bridge site or at Otarama.

The Wairere Power Scheme.

Though one of the most recently formed Power Boards in the country, the Wairere body has lost no time in getting itself on to the Dominion's hydro map. The Wairere Falls, from which power is to be derived, is situated some twenty-two miles as the crow flies from the thriving King Country town of Te Kuiti. The scheme decided upon involves the provision of 1,600 h.p. from an available head of 60 ft. The estimated cost of the work is £38,500, and a loan for this amount is being issued.

The policy of the Board is to erect lines only in those localities where the guaranteed revenue is sufficient to render the work self-supporting. Guarantees have already been received to cover estimated working expenses over and above interest and sinking fund.

The scheme is considered one of the most economical projects in the whole of the Dominion scheme, and the vigour and keenness with which the project has been pursued augurs well for the success of the undertaking.

Electricity Supply in Great Britain.—V.

Berkshire and Oxfordshire.

From a glance at the map of the above counties, reproduced from the 1917 Boundary Commission Maps by permission of the Controller of H.M. Stationery Office, it will at once be evident that there are many acres of "unoccupied areas" in both counties waiting to be "exploited" by some enterprising group of persons or companies (local authorities apparently do not favour the grouping policy—from this point of view, at any rate).

We do not propose at this stage to discuss these areas from an engineering standpoint, but would like to refer those interested to the scale of miles, and ask them to compare some of the distances between the various towns with the distances between towns which are connected in other countries.

For the present our purpose is to show which are the occupied or applied-for areas by hatching these portions on the map.

In addition to the Metropolitan Electric Supply Co., Ltd. (which has bulk supply powers in the Borough of New Windsor and the Rural District of Windsor), there are 16 other undertakers, 13 of which are companies, whose areas of supply are wholly or partly included in this map. The following is the list:—

Local Authorities.

Maidenhead Corporation.
New Windsor Corporation.
Witney Urban District Council.

Companies.

Abingdon Electric Supply Co., Ltd.
Ascot District Gas & Electricity Co.
Banbury & District Electric Supply Co., Ltd.
Chipping Norton Electric Supply Co., Ltd.
Cookham & District Electricity Corporation, Ltd.
Oxford Electric Co., Ltd.
Reading Electric Supply Co., Ltd.
Thames Valley Electric Supply Co., Ltd.
Urban Electric Supply Co., Ltd.
Wantage Electric Supply Co., Ltd.
Whitchurch & Pangbourne Electric Supply Co., Ltd.
Windsor Electrical Installation Co., Ltd.
York Town and Blackwater Gas Co.

The 1921 Census gives the following particulars of the Administrative Counties of Berkshire and Oxfordshire and the associated County Boroughs:—

Acres.	Persons.	Resident families.	Buildings not containing dwellings.
943,050	484,436	114,477	8,213

Since these Boundary Commission maps were prepared in 1917, the following alterations have been made:—

(1) The Parishes of All Hallows, St. Leonard, St. Mary-the-More, and St. Peter have been united to form the new Parish of Wallingford, which is co-extensive with the Borough of Wallingford.

(2) The Borough of New Windsor has been enlarged by the inclusion of the Parish of Clewer Without.

(3) The Parishes of Pishill and Stonor, in Henley Rural District, have been united to form the new Parish of Pishill with Stonor.

(4) The alteration to parishes, &c., in the City of Oxford, made under the Oxford Corporation Act, 1925, does not take effect until April 1st, 1926.

London and Home Counties Electricity District.

As previously mentioned in "Electricity Supply in Great Britain—III," we are not reproducing a map of the County of London or of Middlesex, but maps of the other six Home Counties have now been published in this series.

In this connection we may point out that a map of the London and Home Counties Electricity District has just been published, and is now obtainable from H.M. Stationery Office or through any bookseller (price 3s. net). It is a small-scale copy of the map deposited at the offices of the Electricity Commissioners, showing the boundary of the District as defined in Section 1 of the Schedule to the London and Home Counties Electricity District Order, 1925, which reads as follows:—

Constitution of District.

"The following areas all as constituted at the date of the commencement of the Order giving effect to this Scheme (hereinafter called "the date of the Order"), namely:—

The Administrative County of London, that is to say, the City of London (including the places known as the Inner Temple and the Middle Temple) and the Metropolitan Boroughs of Battersea, Bermondsey, Bethnal Green, Camberwell, Chelsea, Deptford, Finsbury, Fulham, Greenwich, Hackney, Hammersmith, Hampstead, Holborn, Islington, Kensington, Lambeth, Lewisham, Paddington, Poplar, St. Marylebone, St. Pancras, Shoreditch, Southwark, Stepney, Stoke Newington, Wandsworth, Westminster and Woolwich;

The Administrative County of Middlesex;

The County Boroughs of Croydon, East Ham and West Ham;

So much of the Administrative County of Berks as comprises:—

The Municipal Borough of New Windsor;

The Parish of Old Windsor in the Rural District of Windsor;

So much of the Administrative County of Buckingham as comprises:—

The Urban Districts of Beaconsfield, Eton and Slough;

The Rural District of Eton;

The Parishes of Amersham, Chalfont St. Giles, Chalfont St. Peter's, Chenies and Penn; Coleshill Hamlet and Seer Green Chapelry in the Rural District of Amersham;

So much of the Administrative County of Essex as comprises:—

The Urban Districts of Barking Town, Brentwood, Buckhurst Hill, Chingford, Epping, Grays Thurrock, Ilford, Leyton, Loughton, Romford, Tilbury, Waltham Holy Cross, Walthamstow, Wanstead and Woodford;

The Rural Districts of Billericay, Epping, Ongar, Orsett and Romford;

So much of the Administrative County of Hertford as comprises:—

The City of St. Alban;

The Municipal Borough of Hertford;

The Urban Districts of Barnet, Cheshunt, Chorleywood, East Barnet Valley, Harpenden, Hoddesdon and Ware;

The Rural Districts of Barnet, Hatfield, Hertford, St. Alban's, Ware, and Welwyn; the detached part (lying between the Rural Districts of Ware and Epping) of the Parish of High Wych in the Rural District of Hadham;

The Parish of Flaunden in the Rural District of Hemel Hempsted;

§ So much of the Urban District of Rickmansworth and the Rural District of Watford as are not included in the authorised area of supply of the Corporation of Watford as constituted at the date of this Order;

So much of the Administrative County of Kent as comprises:—

The Municipal Boroughs of Bromley and Gravesend;

The Urban Districts of Beckenham, Bexley, Chislehurst, Crayford, Dartford, Erith, Northfleet, Penge, Sevenoaks, and Sidcup;

The Rural Districts of Bromley and Dartford;

The Parishes of Brasted (excluding the detached portion), Chevening, Dunton Green, Halstead, Kemsing, Otford, Riverhead, Seal, Sevenoaks Weald, Shoreham, Sundridge and Westerham in the Rural District of Sevenoaks;

So much of the Administrative County of Surrey as comprises:—

The Municipal Boroughs of Guildford, Kingston-upon-Thames, Reigate, Richmond and Wimbledon;

The Urban Districts of Barnes, Beddington and Wallington, Carshalton, Caterham, Chertsey, Coulsdon and Purley, Dorking, East and West Molesey, Egham, Epsom, Esher and the Dittons, Ham, Leatherhead, Merton and Morden, Mitcham, Surbiton, Sutton, The Maldens and Coombe, Walton-upon-Thames, Weybridge and Woking;

The Rural District of Epsom;

The Parishes of Bisley, Byfleet, Pyrford and Thorpe in the Rural District of Chertsey;

The Parishes of Dorking Rural, Effingham and Mickleham in the Rural District of Dorking;

The Parishes of Addington, Bletchingly, Chelsham, Crowhurst, Farleigh, Godstone (except the detached portion), Limpsfield, Oxted, Tandridge (except so much of the said parish as lies to the south of an imaginary straight line drawn from the point where the western boundary of the said parish joins the southern boundary of the Parish of Godstone to the point where the eastern boundary of the said parish

joins the southern boundary of the Parish of Crowhurst), Tatsfield, Titsey, Warlingham and Woldingham in the Rural District of Godstone;

The Parishes of Artington, East Clandon, East Horsley, Merrow, Ockham, Pirbright, Send and Ripley, West Clandon, West Horsley, Wisley and Worplesdon; and part of the Parish of Compton in the Rural District of Guildford;

The Parishes of St. Martha (Chilworth) and Shalford in the Rural District of Hambledon; and

The Parishes of Betchworth, Buckland, Chaldon, Chipstead, Gatton, Merstham, Nutfield and Walton-on-the-Hill; and Kingswood Liberty in the Rural District of Reigate,

shall be constituted a separate electricity district for the purposes of the Electricity (Supply) Acts, 1882 to 1922, by the name of the London and Home Counties Electricity District, which District is more particularly delineated on the map deposited at the offices of the Commissioners and signed by the Secretary to the Commissioners. In case of any difference arising as to the boundary of the said District, the boundary shown on the deposited map shall prevail."

§ It should be noted that no part of the Urban District of Rickmansworth, as shown on the 1917 Boundary Commission Map of Herts., which we have reproduced, is included in the authorised area of supply of the Corporation of Watford.

The portion of the Rural District of Watford included in the authorised area of supply of the Corporation of Watford may be described roughly as follows:—The Parishes of Abbots Langley and Aldenham; and the Parish of Watford Rural except that part which lies to the south-west of an imaginary line drawn from the north-east corner of the Parish of Rickmansworth Rural (Detached No. 1) to the point where the railway cuts the southern boundary of the Parish of Watford Rural (Detached), as shown on the map which we reproduced.

In other words, the whole of Rickmansworth Urban District as shown on our map is part of the London and Home Counties Electricity District, together with the Parishes of Rickmansworth Rural and Sarratt, and that part of the Parish of Watford Rural (Detached) which lies to the south-west of the imaginary line described above.

Electricity Supply in the Counties of Oxfordshire and Berkshire.

SEVENOAKS.—In our issue of October 16th we said we believed the Sevenoaks and District Electricity Supply Co., Ltd., supplied no electricity in the part of its area outside Kent. This, we learn, was incorrect; the company's mains were extended into Surrey, and a supply was given throughout Oxted and Limpsfield in December, 1922.

Electricity Supply in Fulham. — With reference to our recent article on the extensions at Fulham electricity works, we are informed that Crosby feed water regulators are fitted to all the boilers in this station, including those just put in.

Modern Electric Cookers.

A Review of the Recent Improvements in Electric Cooking Stoves.

While much remains to be done in improving the electric cooking stove before it can be claimed to be within the limits of perfection, much has been done in the past, especially of recent years, that has enabled the manufacturers to put upon the market at least a comparatively efficient apparatus whereby cooking by electricity has become a practical proposition in every class of residence throughout the country. We find manufacturers still divided in opinion as to the best design which should be adopted for the electric cooker; in fact some differ on the main principles of cooking by electricity. But there is ample evidence that all are working hard to bring about the common desire, the efficient and practical cooker; one which deviates as far

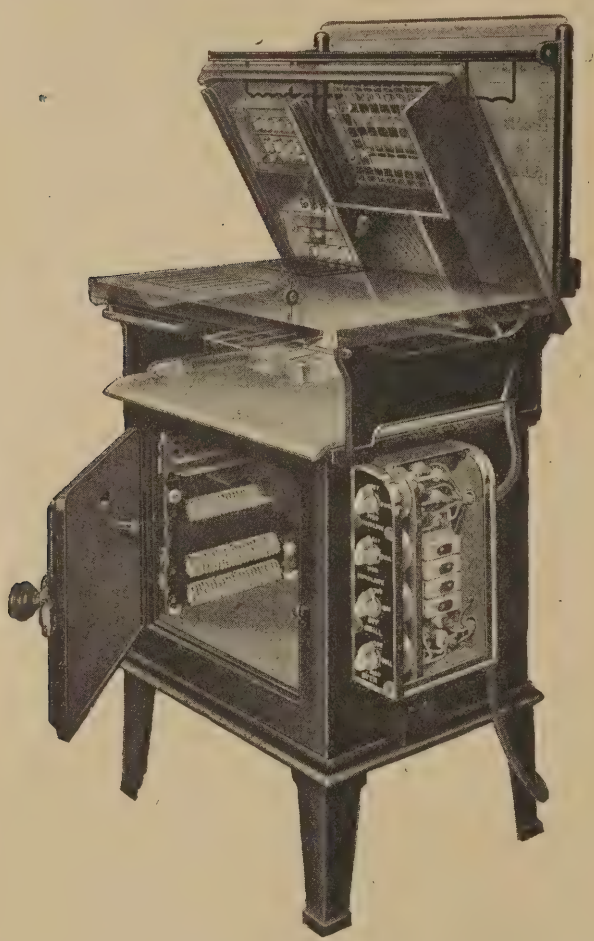

Fig. 1.—Typical Construction of Modern Cooker ("Ghost" View).

as possible from recognition as an electrical appliance and becomes a practical cooking outfit. With the co-operation of several of the electric cooker makers of this country we have been able to gather much interesting information on the subject, and some idea of the trend of the present and the probable future developments.

The construction of the frame and exterior casing of the modern cooker is little altered from that of the past. The general tendency in design is to build a framework of cast iron, with the body or oven panelled inside and out with heavy-gauge sheet-steel plates; varying enamelled finishes add greatly to the attractiveness of many makes. Particular attention has been paid by most makers to the question of suitable adjustment for the oven door in order to reduce to a minimum the heat losses in that direction. The ventilation of the oven is a point which is receiving the serious consideration of the makers, it being the opinion in some directions that in the circulation of the air in the oven lies a great advantage which cooking by electricity holds over other cooking methods. In most cases, thermometers are installed on the doors. In some designs the oven door i arranged with its hinges at the bottom so that it ma be lowered and used as a platform or shelf upon whic the hot foodstuffs may be drawn for inspection, &c The oven handle is so placed in these cases as to act a a support when the door is open. Fig. 2 shows cooker made by Messrs. Coley & Swinnerton with "drop" oven door. Several manufacturers have intro duced rounded corners inside the oven, rendering th task of cleaning the interior a much easier one. A important feature in the construction of several moder makes of cookers is the hinged hob, fig. 1. Thi arrangement proves most valuable for both cleaning an repairing operations with regard to the boiler and th grill elements, and also the crown plate and the top o the oven generally. Many troubles have been cause in electric cooking ranges by the use of flexible wires &c., for the internal connections, but in practically al the modern types, rigid bar connections have bee adopted, suitably protected, and at the same tim readily accessible.

It is perhaps a safe venture to suggest that by far th majority of electric cookers produced nowadays ar

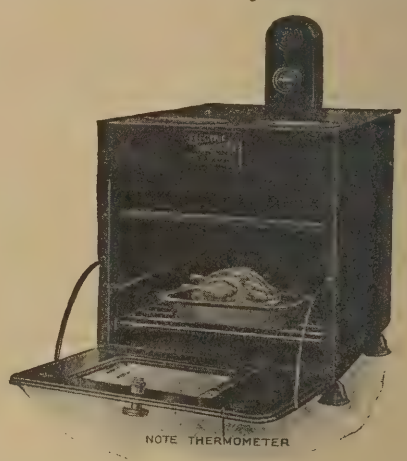

Fig. 2,—Small Oven, "Drop" Door.

either sold under special maintenance schemes or hire out by the supply undertakings, and it is a fact tha many supply engineers have felt the need, in order t be able to continue and progress with their schemes o maintenance, of great improvements which would resul in reducing the repairs bill and also in permitting th necessary repairs to be carried out more speedily an if possible, not on the consumers' premises. Most manu facturers have met this need by arranging the element so that they can be easily removed and replaced in th case of defect without causing any appreciable disturb ance or inconvenience on the site of the installation Generally speaking, three methods of housing and fixin the elements have been adopted to fulfil this require ment: first, by attaching the elements to rigid bar sup ports by means of fixed bolts and wing nuts; secondly by arranging the elements with plug and socket conne tions; and in the last case by building the variou elements in unit form, housed in a metal frame, so tha the whole unit can be removed or replaced simply b "dropping" it in a suitable provision in the main bod of the range. The use of porcelain bushes for fixin the terminals, &c., was at one time a great source o trouble, experience showing that porcelain woul neither stand the necessary temperatures nor th tightening up essential on the terminal and connectio bolts, &c. It is particularly interesting to learn tha Messrs. The Jackson Electric Stove Co., Ltd., are no using porcelain for the purposes specified. They clai that after many years of research they have obtained specially prepared material which will stand up to th

treatment required, and they believe that at the present time they are unique in the use of porcelain in the direction indicated. Further, no mica is used anywhere on the Jackson stoves, the makers being of the opinion that in the past much trouble has been attributable to the employment of this substance, due to its absorbing various liquids which are spilt during cooking operations. Asbestos is used only where it is considered necessary, immediately under the hob plate, for the same reason. For the main connection from the switch box to the elements in this stove, the makers use multi-core cab-tire cable. An illustration of the housing of the elements and the general connections of the modern Jackson cooker is given in fig. 1. The hinged hob is shown in ghost view in two positions.

The modern tendency in the matter of heat control is to install 3-heat rotary regulating switches for the groups of elements for the oven and plates, &c., and to place these in a suitable box either on the side of the oven or under the hob plate. In the "Cosmos" cooker made by Metro-Vick Supplies, Ltd., all the connections are suitably protected, and at the same time readily accessible. By an ingenious arrangement, the whole of the wiring, complete with the fuses and switches, which are mounted on a panel at the side of the cooker, can be removed by undoing a few wing nuts. This is an important feature from a mass production point of view, and also with regard to maintenance schemes, as it allows for any improvements or alterations in the design of the cooker to be readily fitted to a cooker out in service.

A problem with which the electric cooker makers are confronted to-day is to provide one which can be adopted in the very limited space of the modern kitchenette, &c. To design a cooker of high efficiency with dimensions to please the maker is a vastly different proposition to designing one of the same efficiency within the dimension limits necessary for accommodation in the apartments mentioned. The Jackson No. 20b model (Electrical Review, April 24th) is an excellent example of what is being done in designing cookers

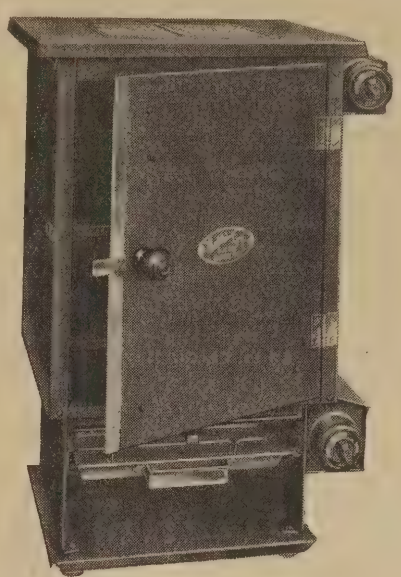

Fig. 3.—Cooker Designed for Limited Space.

for housing schemes, &c., where space is of vital importance. The overall width of this range is 23¾ in., and it has a total loading of 4,950 W for one boiling plate, one griller, and the oven. The "Belling" cookerette, fig. 3, is another good example; its overall width is 15½ in., and its total loading is 2,400 W for the oven and boiler-griller.

(To be continued.)

Three-phase Transmission Lines.

Rapid Preliminary Electrical Calculations with the Aid of Charts.

By GRAHAM ASHWORTH, B.Sc. (1st Class Hons. Eng.), Whitworth Senior Scholar.

The accompanying charts have been prepared to enable the preliminary electrical calculations required for three-phase transmission lines to be made quickly by graphical methods. The following is a list of the symbols employed:—

I. Symbols.

- L = Length of line in miles.
- f = Frequency of circuit in cycles per second.
- r = Resistance of conductor in ohms per mile.
- $R = rL$ = total resistance of one line in ohms.
- x' = Reactance of one line to neutral in ohms per mile.
- $x = 50\,x'/f$ = ditto, ditto, at 50 cycles per second.
- $X = x'L$ = total reactance of one line to neutral in ohms.
- b' = Admittance of one line to neutral in micromhos per mile.
- $b = 50\,b'/f$ = ditto, ditto, at 50 cycles per second.
- $B = b'L$ = total admittance of one line to neutral in micromhos.
- R' = Resistance of one line (and transformers) per cent. of received voltage to neutral.
- X' = Reactance of one line (and transformers) per cent. of received voltage to neutral.
- $S = \sqrt[3]{(A\,B\,C)}$ = effective spacing of conductors in inches, where
- A, B, C = Distances between each pair of conductors in inches.
- d = Outside diameter of conductor in inches.
- a = Area of (copper conductor) in sq. in.
- E_s = Voltage to neutral at sending end.
- E_r = Voltage to neutral at receiving end.
- I = Load current.
- $\cos\phi$ = Power factor at receiving end.
- $Y = jB \cdot 10^{-6}$ = total admittance of one line in mhos.
- $Z = R + jX$ = total impedance of one line in ohms.
- $j = \sqrt{-1}$.
- P = kVA delivered.
- kV = (Standard) line kilovolts at receiving end.
- w = Percentage resistance loss.
  = Total line loss per circuit in kW × 100/kW received.

All logarithms to base 10.

II. Theory of the Charts.

Reactance.— **Chart I.**

$$x' = 2\pi f\,(\text{constant} + 741 \log 2s/d)\ 10^{-6} \quad \text{.....(i)}$$

where

Constant = 102 for 7-wire cable.
= 89 for 19-wire cable.
= 80.5 for wire.

Taking the constant as 92.5 (an error in x of less than 0.7 per cent.), when $f = 50$, $x' = x$ and equation (i) may be written—

$$\log 2s - \log d = 4.30\,x - 0.125 \quad \text{.....(ii)}$$

Plotting $\log 2s$ and $\log d$ on rectangular axes, different given values of x in (ii) give different parallel straight lines at 45 deg. with the axes (with the same scales for $\log 2s$ and $\log d$). These lines give an even scale with any transversal, as may be seen by giving $\log d$ a constant value in (ii).

Admittance.— $b' = 2\pi f\ 0.0388/\log 2s/d$ .....(iii)

and when $f = 50$, $b' = b$; equation (iii) may then be written—

$$\log 2s - \log d = 12.20\ b^{-1} \quad \text{.....(iv)}$$

Comparing (ii) and (iv)—

$$4.30\ x = 0.125 + 12.20\ b^1 \quad \ldots\ldots\ldots\

Chart II.

Scales.—From the vector diagram for regulation, neglecting capacitance,

$$(100 \sin \phi + X)^2 + (100 \cos \phi + R')^2 = (100 + \text{regulation in } \%)^2.$$

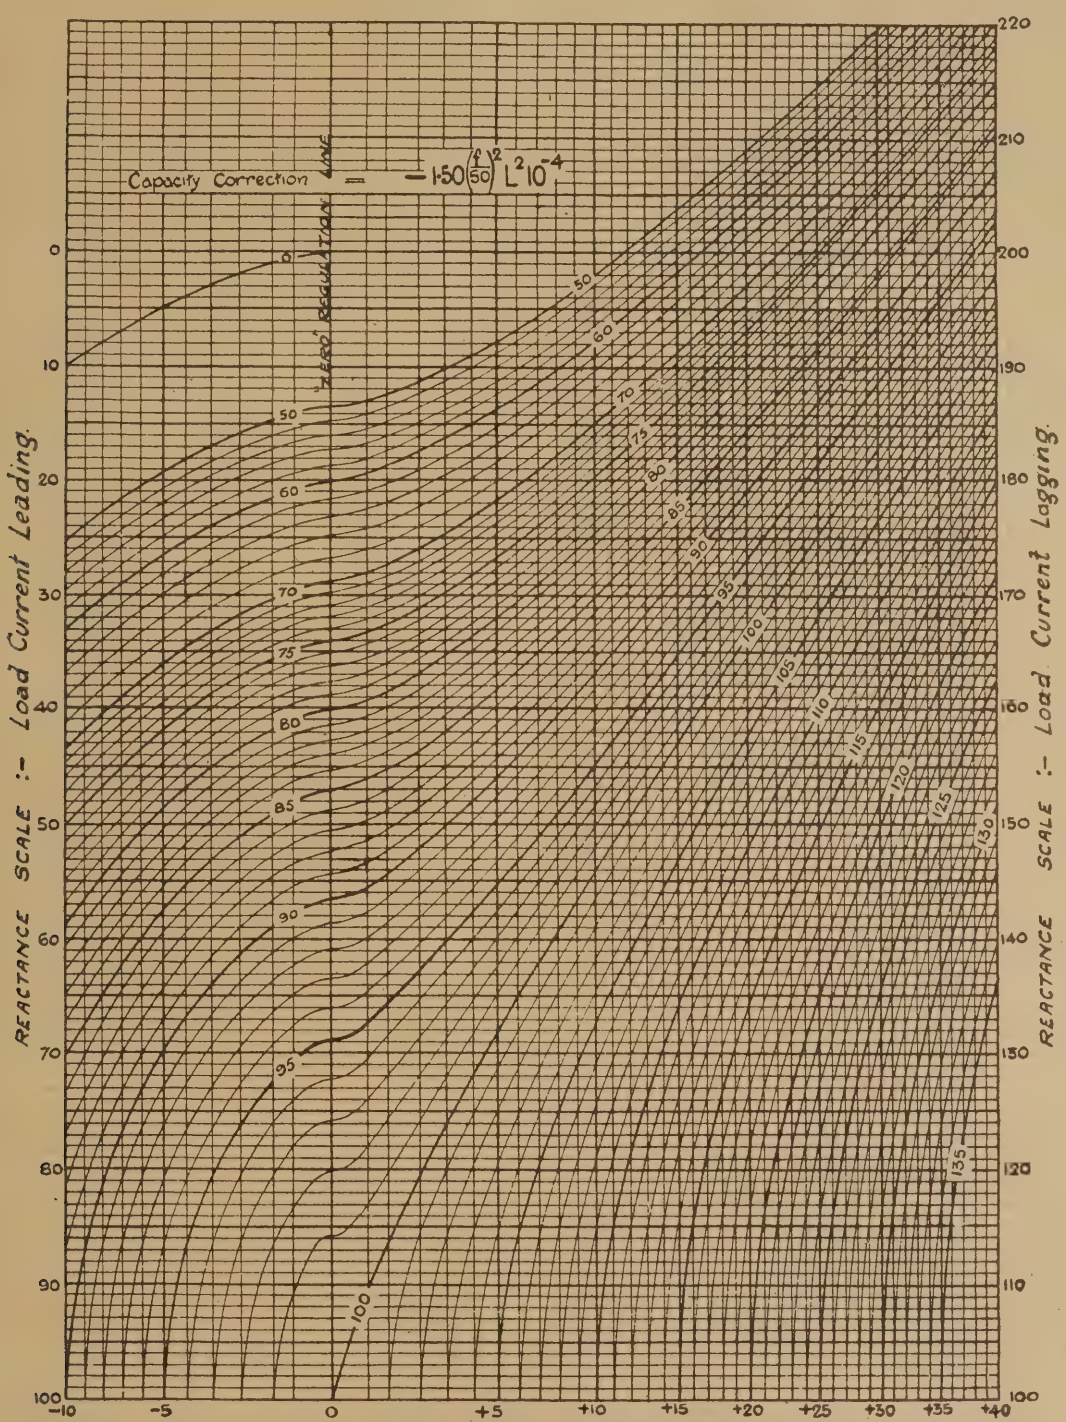
The vertical scale is even, and the

Value of horizontal line $= 100\ (1 \pm \sin \phi)$.

The horizontal scale, to give a suitable type of chart, is spaced so that the regulation is proportional to (distance of regulation line from zero line)$^{\frac{1}{2}}$.

The curved lines are—

$$100 \cos \phi + R' = \text{constant}.$$



rigid mathematical solution of a line with distributed resistance, reactance, admittance, and leakance, is—

$$\text{Regulation} = (E_s - E_r)/E_r = YZ/2 + Y^2Z^2/24 + \text{----} + IZ/E_r \cdot (\cos \phi \pm j \sin \phi)\ (1 + YZ/6 + \text{----})$$

The chart gives, as accurately as it is drawn (*i.e.*, with a maximum error of about 0.1 per cent. on the regulation scale), the value of $IZ/E_r \cdot (\cos \phi \pm j \sin \phi)$, and so the important correction for capacity is—

$+YZ/2 = + \frac{1}{2} j B 10^{-6}\ (R + jX)$, assuming zero leakance,

$= -\frac{1}{2} B X 10^{-6} + \frac{1}{2} j BR 10^{-6}$.

Example:— Determine the regulation of a circuit consisting of a line 105 miles (=L) long, with two banks of transformers, operating at a frequency of 60 cycles per second (=*f*) and a lagging power factor of 75%.

The total resistance drop of the line and transformers (R′) = 4.5%.

The total reactance drop of the line and transformers (X′)=21.0%.

Solution:—Cos ϕ = 75.9

Add R′ = 4.5

79.5

The curve 75.0 meets the "zero" regulation line at a point measuring on the reactance scale:— 166.0

Add X′ = 21.0

187.0

At the intersection of curve 79.5 and horizontal line 187.0, read on the regulation scale + 18.0%

Capacity correction $= -1.50 \cdot \left(\frac{60}{50}\right)^2 \cdot 105^2 \cdot 10^{-4}$ = −2.4%

True regulation of circuit = 15.6%

Chart No. II.—Ashworth Regulation Chart.

The chart may, of course, be used for the determination of both line and transformer regulation, and the zero curve has been added for transformers operating with pure capacity current.

Capacity Correction.—The formula obtained by a

The value of the term $\frac{1}{2} j$ BR 10^{-6} is negligible, since not only is it small for lines in which the capacity effect is important, but it is practically perpendicular to the "received voltage" vector, and the correction is

$$-\tfrac{1}{2} B X 10^{-6} = -\tfrac{1}{2} b' x' L^2 10^{-6}.$$

Equation (vi) gives the value of $b'x'$ as $3.00\ f^2/50^2$, and thus—

$$\text{Capacity correction} = -1.50\ L^2\ \frac{f^2}{50^2}\ 10^{-4}\ \%.$$

Accuracy.

The accuracy obtainable by using the chart may best be demonstrated by the following table:—

Case.			I.	II.	III.	IV.	V.
Length of line ...	L	Miles	300	250	250	250	250
Frequency	f	Cycles/sec.	60	50	50	50	50
Apparent power received per circuit	P	kVA	18,000	19,000	100,000	100,000	100,000
Line voltage received	kV	Kilovolts	104	110	200	200	200
Resistance drop ...	R'	% of kV	17·5	8·3	6·5	6·5	6·5
Reactance drop ...	X'	% of kV	41·5	25·7	41·9	41·9	41·9
Load power-factor ...	cos ϕ	%	90 lagging	80 lagging	62 lagging	Unity	85 leading
Chart regulation ...	—	%	+37·0	+23·0	+37·5	+14·5	− 7·8
Capacity correction...	—	%	−19·5	− 9·4	− 9·4	− 9·4	− 9·4
Sum	—	%	+17·5	+13·6	+28·1	+ 5·1	−17·2*
Regulation by exact method ...	—	%	+17·7	+13·6	+28·4	+ 5·6	−15·6*

*The difference between these two results is chiefly due to the resistance drop of the capacity current, which has a greater effect at leading power-factor.

The pressure rise on no load is given (for the line only) by the correction for capacity derived above.

III. Formulæ

Voltage.—A purely empirical formula for voltages up to 110 kV is:—

Receiving end pressure $= \sqrt{(PL/104)}$ line kilovolts.

Power Loss.—$a = PL/225w \cos \phi\ (kV)^2$ square inches.

IV. Example.

Say, 20,000 kVA is to be delivered at 60 cycles and 75 per cent. lagging power factor over a distance of 105 miles, with a line resistance loss of about 4 per cent.

Formulæ.—With two circuits, $P = 10{,}000$ kVA, and receiving end pressure $= \sqrt{(10{,}000 \times 105/104)} = 100.5$, say, 110 line kV, since this is a standard.

Then $a = 10{,}000 \times 105/225 \times 4 \times 0.75 \times (110)^2 = 0.128$ square inch.

A convenient size of conductor is 7/.152, which has an area of 0.125 square inch; this gives a line power loss of 4.1 per cent.

Line Constants.—From Chart No. 1 the usual flat spacing for 110 kV is about 15 feet. Taking this value and a cable area of 0.125 square inch (noticing that there is no appreciable corona effect), the chart gives—

$$r = 0.36$$
$$x = 0.680$$
$$b = 4.35.$$

Whence $R = Lr = .36 \times 105 = 38$ ohms

$X = Lx' = 60/50 \times 0.68 \times 105 = 86$ ohms

$B = Lb' = 60/50 \times 4.35 \times 105 = 549$ micromhos.

Regulation.—Percentage resistance drop of line $= PR/10\ (kV)^2 = 3.1\%$.

Say for transformers' resistance (both banks) 1.4%, then $R' = 3.1 + 1.4 = 4.5\%$.

Percentage reactance drop of line $= PX/10\ (kV)^2 = 7.1\%$.

Say for transformers' reactance (both banks) 13.9%, then $x' = 7.1 + 13.9 = 21.0\%$.

From Chart No. II we see that the regulation from the low-pressure side of the transformers at the receiving end to the low-pressure side of the transformers at the sending end is 15.6%.

Voltage at sending end (referred to h.p. side) $= 110 \times 1.156 = 127.2$ line kV.

Zero Load Conditions.

Line Capacity.—$B\ (kV)^2/1{,}000 = 6{,}630$ kVA leading.

With both banks of transformers connected to the line, and each taking a magnetising current equal to 6 per cent. of the full-load current, the lagging kVA for magnetisation $= 10{,}000 \times .12 = 1{,}200$, and the load on generating plant $(6{,}630 - 1{,}200) = 5{,}430$ kVA leading.

Pressure Rise.

= Capacity correction + transformer regulation due to capacity current.

$= +2.4 +$ (reactance drop of one bank of transformers) × capacity kVA/full-load kVA.

$= 2.4 + 6.95 \times 5{,}430/10{,}000.$

$= 2.4 + 3.8.$

$= 6.2\%.$

Thus if the load is suddenly thrown off, the voltage across the transformers at the receiving end will rise to about $127.2 \times 106.2 = 135$ kV.

The Commercial Motor Exhibition.

Some Notes and Comments on Electric Vehicles and other Exhibits.

(*Concluded from page* 727.)

An innovation at this year's Olympia show was a section devoted to modern plant for general garage purposes and appliances and tools for general service and repairs which was of business interest to owners of both small and large fleets of vehicles. The exhibits included such things as electrically-operated machine tools, drills, lathes, pumps, air compressors, and tire pumps; a kerbside remotely-controlled electric tire inflator, a magneto armature tester, and garage lighting equipment, &c.

The electrical items in another section, which had been allocated for the display of recent inventions affecting road vehicles, were chiefly of the nature of direction indicators and traffic signals.

Amongst the vehicles in the main section of the show, six wheelers were no longer regarded as freaks, air brakes were noticed on several makes of chassis, and a steam brake on one wagon; pay-as-you-enter 'buses were in evidence, whilst the safety of enclosed omnibuses was enhanced in nearly all cases by the provision of an emergency door.

Electric Vehicles and Trucks.

A new comer in the battery-driven vehicle market was the G. V. road tractor, a neat and powerful machine suitable for hauling loads of from 2 to 4 tons. It was fitted with a "Philco" battery, and was shown in conjunction with a specially-made 2-wheel trailer for the collection of offensive trade refuse bins. The body has been designed on sanitary lines, being sheet-metal-lined, and the loading line is just over 2 ft.

The General Vehicle Co., Ltd., had the only "all-electric" stand in the exhibition, and amongst the vehicles shown was a 2-ton standard chassis fitted with a box-van body for carriers. One of the special features of this type of vehicle for parcels delivery work is the easy accessibility of the interior of the body through the driver's cab, thus enabling the delivery work to be carried out entirely by the driver. A 3½-ton chassis was equipped with an all-wood steel-lined end-tipping body. The tipping gear, which is electrically operated, is of the "Edwards" hydraulic type. Three- and 2-ton Baker industrial electric trucks have a 2-wheel drive and 4-wheel steering. An auxiliary motor raises the loading platform, and is controlled by a limit switch, while the 10-ton tractor is capable of a speed with the rated load of 4 miles per hour; it is also supplied for various rail gauges.

The 3½-ton "electric" exhibited by Clayton Wagons, Ltd., was driven by a single motor, and the controller under the driver's seat provides five forward and two reverse speeds. The body was provided with end-tipping gear, of the run-back type, operated by an independent motor.

Electric Lighting and Starters.

All the leading manufacturers of electric lighting and engine-starting ignition equipment is exhibited in the accessories section. Electric lighting, not so long ago confined to private cars, was a feature of the "commercials" at the show, including steam wagons. Electrically-lighted taxi-cabs are now commonly seen, and several makers have produced generating sets which function without the aid of batteries, cut-outs, &c. Amongst these mention may be made of the C.A.V. and Simms machines, but one of the simplest was on the stand of the Villers Engineering Co., Ltd. This 12-volt generator differs from the more usual type, since it has a rotating field magnet and a stationary armature, which fact makes it possible to dispense with commutators, slip rings, brushes, and other parts usually liable to give trouble. The field magnet consists of a brass shell containing two laminated-iron pole pieces and two cobalt-chrome steel magnets. The armature is a laminated assembly in the form of a cross, on to the arms of which are wound four coils connected together to form two absolutely independent circuits. Twin cables are used to connect the lamps to the dynamo, one wire of each pair being fitted with a push-in connector, and the other with a terminal to be bolted on to the armature plate. This arrangement is an improvement upon the system of an earth return through the frame of the vehicle. The normal running speed is 3,000 r.p.m., but there is no flicker with speed reduction, and a special 2-way switch is incorporated in each lamp adaptor so that either or both lamps may be used as required. As each pair of coils is independent of the other, a breakdown in one circuit would not affect the other lamp. Although starting motors are not yet provided to any extent on the heavier type of commercial vehicle, they are now extensively used on the delivery-van pattern of chassis, and are also fitted to some passenger-carriers and taxis. Magneto ignition seems to be most favoured still, though occasionally a coil ignition system was to be seen, for instance, on the Reo and G.M.C. vehicles.

Other Features.

Methods of driving generators and motors differ, but an ingenious new starting-motor mechanism is a product of the C.A.V. Co. A worm and wheel are employed in conjunction with an automatic cone clutch, which can be accommodated in a surprisingly small space. It enables the designer to place the motor where he will, gives any gear reduction required, and operates in silence.

A practical method of mounting the head-lamps on the new A.E.C. chassis, each with a ball carried in a bracket having a spherical seat bolted to the radiator side bracket, permits individual adjustment of the lamps, as well as either lamp to be turned right round to facilitate work on the engine or elsewhere at night. A De Dion idea is to mount the radiator fan on the end of the dynamo shaft and to belt-drive the two together.

On the Spa "one-man" 'bus two electric bell-pushes were fitted, one on each side, for communicating with the driver, and a feature of the electric lighting and starter wiring system was that full access to the rear of the switchboard was obtainable by lifting the engine bonnet. On the Sentinel steam wagon the dynamo drive was noticed as having been converted from link belt to chain; the former method is used on the Clayton steamer, but a typical modern design is to drive the water pump, magneto, and dynamo in line or tandem by one shaft. A Fiat pay-as-you-enter 'bus was provided with a recessed electric lamp, which illuminated the step as the door was opened.

Refractory Formers for Electric Fires.

Their Radiant Efficiency: Interesting Test Results.

By C. H. S. TUPHOLME.

Some interesting tests have recently been completed on the radiant efficiency of formers made of a new material, known as "Fosalsil moler," in comparison with a standard fireclay former in extensive use on electric fires. The two formers were rectangular in shape and recessed to take a heating spiral; they were similar in all respects, with the exception of their composition.

It is well known, of course, that in an electric fire the most desirable method of dissipation is by radiation, and the method which should be avoided, so far as is possible, is that of conduction. Heat conducted through the former to the frame and the back of the fire is, for all practical purposes, wasted and is undesirable. If two similar elements be mounted in formers exactly alike in shape, but differing in conductivity, the heat dissipated by conduction is less in the one case than in the other, the one with the greater conductivity losing more heat in this manner than the one with the less conductivity. In consequence, the temperature of the element in the latter will rise to such a value that the rate at which heat is then dissipated is equal to the rate of supply. The effect of this is that the latter element dissipates a smaller proportion of the total heat supply by conduction than the other element, and in consequence the greater is the proportion that must be dissipated by radiation and convection.

As the "Fosalsil moler" former had been found to have a lower heat conductivity than the standard fireclay former, it was to be expected that, if similar heating elements were fixed in the two, then, for the same consumption of electric power, the moler element would attain a higher temperature than the fireclay element, and the moler element would give out as radiant heat a larger proportion of the energy supplied to it than would the fireclay element. Tests were made to see if these conclusions were correct.

The power consumed in each case was 1,035 watts on a 200-volt circuit. The element temperatures, together with the element temperature of an element of one of the leading types of bowl fire, were:—

Fosalsil moler element	...	890 deg. C.
Standard fireclay element	...	830 deg. C.
Bowl-fire element	... ...	880 deg. C.

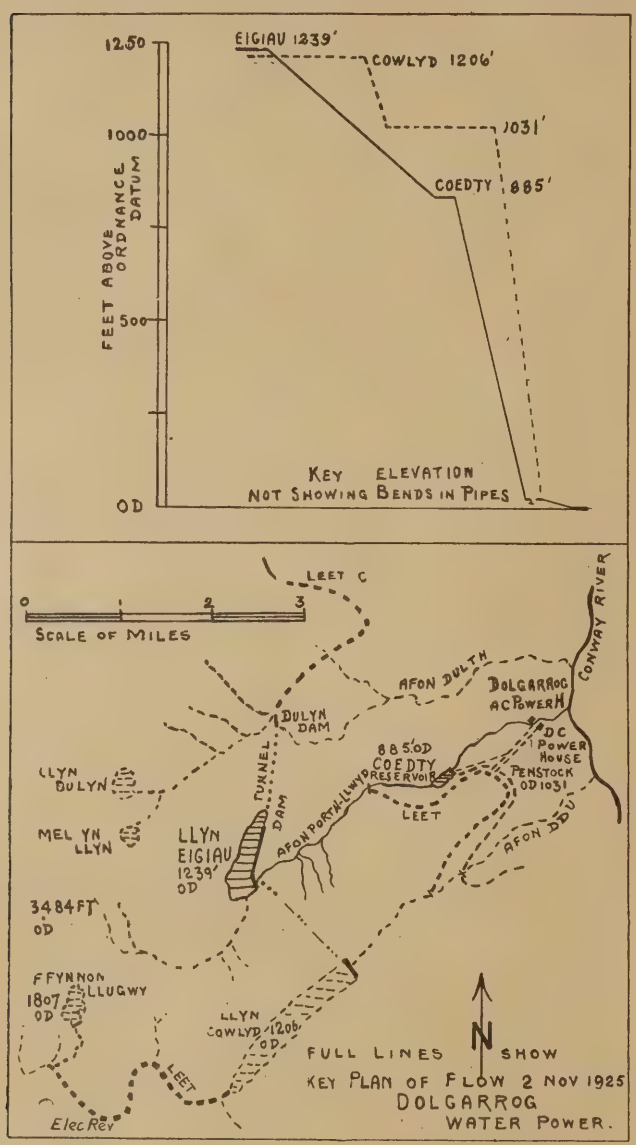
The results of the radiant heat tests were:—

	Intensity of radiant heat received normal to former at a distance of 48 ft. 5 in. Cals. per sq. in.	Ratio between normal radiant heats (Fireclay former = 100%). Corrected for equal watts. Actual.	equal watts.
Fosalsil moler element	0.0177	112½	113½
Fireclay former ...	0.0157	100	100

The correction was necessary, as the power consumed differed slightly in this test, being 1,030 watts for the moler former and 1,040 watts in the case of the fireclay former.

The conclusions arrived at by the investigators are:—(i) The low conductivity of the moler is favourable to its use as a material for the construction of formers for electric heaters, and (ii) the figures obtained show that the manufacturers who have adopted it secure an immediate increase in the radiant efficiency of their fires of 13½ per cent., when compared with the ordinary fireclay formers.

Clear and Opal Lamps.—The General Electric Co., Ltd., has sent us a picture which illustrates in a remarkable manner the difference between the light given by a clear gasfilled "Osram" lamp and that produced by a "White Osram" lamp. The latter gives a diffused light which softens shadows almost to the point of total elimination, while with the clear lamp they are very hard.



The North Wales Dam Accident.

An Account of an Investigation at Dolgarrog.

By THEODORE STEVENS.

The unexpected partial emptying of the stored water in Lakes Eigiau and Coedty which occurred on November 2nd with unfortunately fatal results—sixteen persons are dead or missing—was due to a washout beneath the dam at Eigiau.

Details of the development of hydro-electric power in 1908 were recorded in the Electrical Review at that time.* From the key map and elevation, which is too small to indicate bends in pipe lines, it will be seen that

Sketch Plan and Elevation.

the part of the present development affected by the accident is shown in full lines, and adjacent works are shown in broken lines. Eigiau lake's level was at 1,219 ft. above ordnance datum, and quoting from the issue referred to,* the dam is three-quarters of a mile long, and was built under the direction of Messrs. Harper Bros. & Co. and Messrs. Kincaid Waller Manville and Dawson by Messrs. Bott & Stennett, Ltd. It stores 160 million cubic feet up to its spillway at o.d. 1,239. The sluice is 25 ft. lower.

Leets, having a capacity of 3,500 cubic feet per minute, were constructed to collect the run-off, and a tunnel led water from the Dulyn dam into Lake Eigiau.

The dam varies in visible height from over 50 ft. at the river bed outlet to about 4 ft. at the bend in plan, but higher towards the tunnel end of the lake.

* Electrical Review, November 6th, 1908, pp. 803, *et seq.*

The opening beneath the dam structure through which the contents of about the top 20 ft. depth of the lake issued on the night of November 2nd is some 45 ft. long and 10 ft. or more deep. When this small remaining volume is drained off through a trench now being cut, the engineers will be able better to examine the ground on which the dam stands. At one end of this opening, boulder clay is visible above the water beneath the dam, and to the writer it was not apparent why a greater length of supporting boulder clay was not carried from beneath the dam by the rush of water.

The first intimation of the flood at the Dolgarrog power plant was at 9.30 p.m. on Monday, November 2nd, when a shift engineer and a driver were on duty in the "new," or alternating-current, power house, which then was carrying a load of 4,000 kilowatts (10,000 kilowatts installed plant).

In the "old," or direct-current, power house two others were on duty supplying 5,000 kilowatts to the aluminium furnaces.

After the first rush at the power house the water was noticed to recede, but Eigiau was discharging 85 million cubic feet total into the already full Coedty reservoir, so the water passed over, not only the spillway designed for maximum flood conditions, but over the crest of the Coedty dam, and it washed away a large part of the earth backing to this dam, exposing the 30-in. core of reinforced concrete, which could not withstand the pressure due to the velocity of the enormous flow (see illustrations elsewhere in this issue). Sir Douglas Fox and Partners were consulting engineers for the Coedty dam and subsequent works.

When this dam broke there was an additional 12 million cubic feet of water let loose. The Porthllwyd falls discharged this total of three million tons, and it is not surprising that all soil in its path was washed out and a vast weight of boulders thus denuded went forward and buried a considerable area.

The water-power service of electricity was cut off at Llandudno, Colwyn Bay, Conway, and Penmaenmawr from 9.30 p.m. on Monday until 4.55 p.m. on Tuesday. Llandudno got its own plant into service at 11.30 p.m. on Monday. Bangor and Carnarvon, having their own plants in service, were also able to restore supply on Monday evening. By 4.55 p.m. on Tuesday, November 3rd, full lighting supply over the whole area had been restored, as well as 70 per cent. of the power demand.

The area west of Penmaenmawr was not affected to an appreciable extent at any time.

Over the area all available sources of electricity are in process of being interlinked, and the Gresford Colliery, which has been feeding into this network since August 1st, 1925, was actually supplying at the time of the mishap, and has continued to carry the Wrexham load in conjunction with the Wrexham Corporation's steam plant, which was in reserve at the time of the mishap. Wrexham was "off" for two minutes. The Mersey Power Co. will be linked up by April, 1926.

With the exception of Colwyn Bay, every town in North Wales on the service has retained its former plant, but when the transmission system is completed, there will be no necessity for the smaller plants now retained in Bangor, Carnarvon, Llandudno, Rhyl and Wrexham.

The Cwm Dyli power house (outside the area of the key map) of 7,000 kVA capacity, with storage in Lynn Llydaw, has been continuously in service, and it could have maintained the supply on the Monday night had not the poles across the path of the flood been washed away.

The Dolgarrog Dam Burst and Flood Damage.

As we briefly reported last week, Llyn Eigiau, one of the natural lakes in the Welsh hills on the west side of the river Conway, which was converted into a reservoir about 17 years ago by the North Wales Power Co., undermined its embankment at 9.30 p.m. on November 2nd. The water thus released precipitated itself upon the north end of the village of Dolgarrog, and on its way to the River Conway demolished a long stretch of highway, a road bridge, and several houses, other buildings being damaged; 16 lives were lost.

Photopress] *[London.*

Fig. 1.—View Down the Pipe Line.

The flood swept through the Aluminium Corporation's works and the hydro-electric power houses, but, apart from the regrettable loss of life, the material damage seems to have been not so extensive as was at first reported. Fig. 1 is a view looking down the pipe line on to the Dolgarrog works, while figs. 2 and 3 show portions of the two dams. Other views of the damaged works are reproduced on page 783.

Photopress] *[London*

Fig. 2.—The Wash-out at Eigiau Dam.

Llyn Eigiau is about a mile long and 1,200 ft. above sea level, lying some four miles west of the village; the concrete dam is "L" shaped and in the middle of the shorter limb, the natural outlet of the lake, the Porthllwyd originates; it is near this spot that the wash-out is reported to have taken place. The water swept into the subsidiary Coedty reservoir, which is near the verge of the cliff above Dolgarrog, but the volume was too great and the lower dam failed to prevent the water falling 500 ft. almost perpendicularly from the edge of the table land on to the village below. According to Mr. H. J. Jack, managing director of the Aluminium Corporation and its allied companies, who was interviewed by *The Times* correspondent in the presence of General R. F. Legge, Treasury director of the North Wales Power Co., the accident is not to be described as a catastrophe for either manufacturing or electricity generating works. The damage to the high-level reservoir is comparatively slight. Electricity supply was restored from the generating station at Cwmdyli, near Beddgelert, and on November 3rd a small machine was running at Dolgarrog. The two pipe lines are intact, except that at the top end of the penstock dam a short length of branch pipe has been dislocated. Only four of the aluminium furnaces or baths exploded when the water reached them, and he estimated that all the material damage would be made good in four months' time.

Photopress] *[London.*

Fig. 3.—Breach in the Dam at Coedty.

The North Wales Power Co. purchases its power from the Aluminium Corporation and exercises the supply powers of the joint authority controlling the North Wales and South Cheshire Electricity District—the only such authority that has functioned under the Electricity Commissioners' scheme of reorganisation. A new distributing organisation is coming into operation in three months' time, and the accident will not affect the arrangements to any material extent.

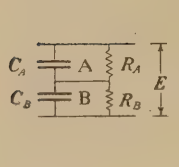
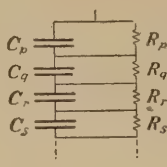
D



Dielectric Problems in High-Voltage Cables.



By P. DUNSHEATH, O.B.E., M.A., B.Sc., M.I.E.E.

(*Abstract of Paper read before the* Institution of Electrical Engineers.)

The three dielectric characteristics most generally considered in h.p cable work are a.c. losses, a.c. breakdown strength, and dielectric resistance (measured by d.c.), but the order of importance is a matter of opinion and the connection between the three not at all understood. For some time there has been a growing conviction that the phenomena displayed under the conditions employed for measuring the d.c. resistance are at the bottom of a.c. losses. For this reason prominence has been given in the paper to the consideration of dielectric absorption.

The correlation between a.c. and d.c. phenomena has been hindered in the past by the fact that d.c. resistance has usually been measured at voltages of 500 or less, whilst a.c. loss measurements have been carried out at from 10,000 and upwards and the uncertainty of the effect of voltage has made it impossible to bridge the gap between the two sets of published results. A.c. tests carried out under these conditions admittedly do not bring to light the phenomena connected with the ionisation of air entrapped in the dielectric, but the investigation of this factor separately is an advantage. The bringing together of a.c. and d.c. data for the same dielectric seems to be imperative for the fuller understanding of the complicated phenomena encountered. It does not take us the whole way, but it enables us, for example, to obtain a new conception of dielectric losses independent of "hysteresis." By the theory here put forward alternating dielectric losses are explained as I^2R loss, caused simply by a current flowing through a resistance as in other types of electrical loss, and the idea of dielectric hysteresis becomes unnecessary.

Figs. 1 & 2.—Model Dielectrics Illustrating Absorption.

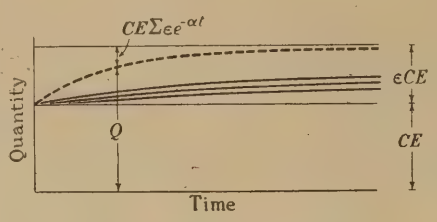


Fig. 3.—Effect of Time Constants.

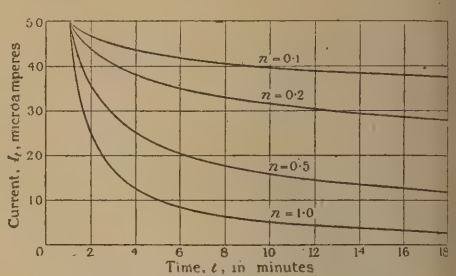

Fig. 4.—Empirical Absorption Curve, showing Effect of Varying n.

Dielectric Absorption (*Theoretical*).—"Electrification" has long been known in connection with the testing of gutta-percha cables, and it has recently appeared in a new form in connection with the testing of a.c. power cables with h.p. d.c. generated either by the Delon apparatus or by rectifying valves. If a cable for a working pressure of, say, 33,000 volts be charged up to 100,000 volts for a few minutes and afterwards short-circuited, it is not safe to remove the short-circuit for some time, as the residual charge absorbed by the cable will leak back and charge the conductor to a dangerous value. It is becoming increasingly evident that a.c. dielectric losses are largely the result of d.c. absorption, and the demands for the consideration of the claims of d.c. for high-voltage long-distance transmission are becoming insistent. For both reasons a summary of the underlying principles of absorption are called for.

Two main theories claim to explain in different ways the mechanism of dielectric absorption and residual charge. The first one, advanced originally by Maxwell, depends on the distribution of charge throughout a non-homogeneous dielectric. He considered the component capacities and resistances in the dielectric and showed that the distribution of potential under transient conditions is settled largely by the arrangement of component capacities, whereas under steady conditions it is fixed by the arrangement of component resistances. The time-lags of electrification and de-electrification are considered in this theory to be due to the time occupied in the rearrangement of potential between one of these conditions and the other.

In the second theory, advanced originally by Hopkinson and since elaborated by other writers, the phenomena are connected with the movement of the electron in the atom. Maxwell's original idea of a heterogeneous dielectric seems to be most useful for cable work, and by the use of this conception it is possible to build up a very simple theory which at the same time conforms exactly to the deductions of Pellat and Schweidler; moreover, it can be used not only for explaining dielectric absorption under d.c. conditions, but also as a basis for a simple conception of dielectric losses under a.c. conditions.

Two condensers and resistances connected as in fig. 1 approximate to a practical absorptive condenser. The ratio of the capacities must be different from the inverse ratio of the resistances, that is:—

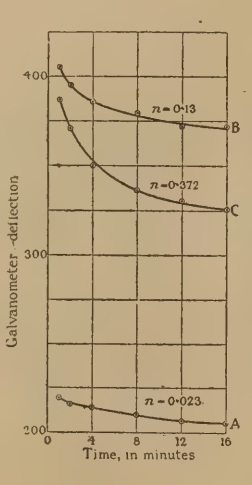
$$\frac{R_A}{R_B} =/= \frac{C_B}{C_A}$$

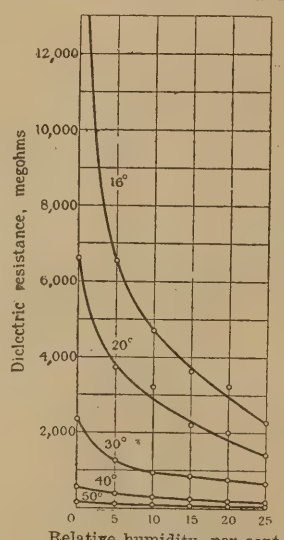
Under steady conditions the potential of the centre point of the combination is settled by the ratio of the resistances, the capacities having no effect. Under transient conditions, however, such as occur at the instant of applying a difference of potential across the group, the potential of the centre point is controlled by the ratio of the capacities, and the resistances have relatively no effect. The potential distribution will be as shown in Table I, where E is the applied e.m.f.

At the instant of switching on, therefore, such an arrangement acts as a pure capacity taking a heavy momentary charging current. Immediately, also, redistribution of potential commences and requires further current, which dies away until, when steady conditions are attained, only that flowing through the resistances remains.

Table I.

Condition.	Potential difference across A.	Potential difference across B.
Steady	$\frac{R_A}{R_A + R_B} E$	$\frac{R_B}{R_A + R_B} E$
Transient	$\frac{C_B}{C_A + C_B} E$	$\frac{C_A}{C_A + C_B} E$





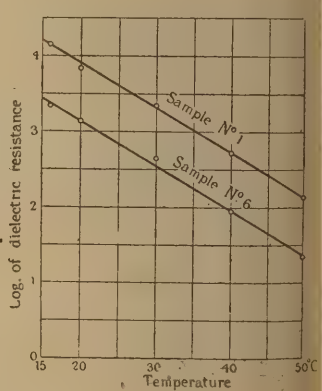


Fig. 5.—Cable Compound Charging Current.

Figs. 6 & 7.—Variation of Dielectric Resistance of Conditioned Celluloid.

When short-circuited, a sudden rush results in the total discharge of the smaller condenser and the taking from the other of an equal quantity. At this instant a quantity of electricity equal to the difference between the full charges of the two component condensers is set free and commences to discharge partly through its bridging resistance and partly through the other resistance component and the external circuit, the latter part representing the residual charge. If, after the initial short-circuit, the external circuit is opened, the discharge of the larger condenser which is still in progress charges the outside plates, giving rise to another phenomenon noted with absorptive condensers—the repeated reappearance of a charge on the plates after temporary short-cicuits. It is evident, then, that such an arrangement, in addition to giving all the charg-

ing characteristics of an absorptive condenser, also imitates the conditions during discharge.

Suppose that, instead of only two condensers and two resistances, we consider an infinitely large number of them as shown in fig. 2; we now obtain for the total quantity of electricity stored up to time t the following expression :—

$$Q = CE + CE\int \epsilon\,(1 - e^{-\alpha t})\,dt$$

At the instant of closing the circuit the charge CE enters the condenser. Immediately also an infinite number of additional charges commence to increase from zero at different rates, as indicated by the collection of curves in fig. 3. The dotted line represents the sum of these component curves and approaches asymptotically the ordinate CE $(1 + \epsilon)$. From the same considerations we obtain the following expression for the total current flowing after time t through the series of circuits with various time-constants :—

$$I_t = \frac{E}{R}\int_{\alpha=0}^{\alpha=\infty} e^{-\alpha t}\,dt$$

This analysis does not lead to a formula which can be employed for the practical estimation of the current flowing in an absorptive condenser after a given period, so that we are compelled to fall back on an empirical expression. The most commonly used expression for the charging-current time characteristic is $I_t = I + At^{-n}$, where I is a true conduction current still flowing after infinite time; A and n are constants, the latter having a value less than unity, and the quantity At^{-n} represents the current supplying the absorbed charge.

Results already published, as well as the author's own experiments, show that this expression never does represent accurately the actual variation of current in a cable dielectric over any considerable period of time. It appears to be sufficiently accurate over short intervals (seconds) to make it useful in connecting the d.c. and a.c. characteristics of a dielectric, and if we adopt the convenient reservation that n itself varies with time, we can use the expression in the form given with considerable advantage both for analytical discussion and for the interpretation of practical results. Fig. 4 shows the relative shapes of current/time curves calculated for different values of n from 0.1 to 1.0 and, to anticipate for a moment, curves plotted from experimental results obtained on cables appear to start on one value of n and to change gradually with time to a different value. It is evident from fig. 4 that the 1-minute value is an imperfect indication of the nature of the dielectric. A number of cables may all have the same 1-minute value and yet have widely different characteristics depending on the value of n.

Two methods of determining the values of the constant from an experimental curve are worked out in an appendix, allowing for the presence of I in the formula $I_t = I + At^{-n}$. In view of the change of n with time which took place in all cable dielectrics so far examined, the determination of the constants from different finite parts of the curve may lead to different values of I, in some cases the early portion giving a negative value.

To sum up, it is evident that whether we are discussing the correct ratio to adopt between d.c. and a.c. pressure for high-voltage testing, comparing d.c. and a.c. losses for theoretical interest, attempting to show that a.c. losses are partly due to d.c. resistance, or any other of the similar problems that are receiving special attention to-day in connection with high-voltage cables, we cannot be too precise in our definition of the d.c. resistance. Although the whole phenomenon of absorption can be shown as above to be based on resistance within the dielectric, the value of this resistance is elusive.

Dielectric Absorption (Experimental).—Experiments by the author show that n may change considerably between, say, 15 seconds and 5 minutes, and, in addition, the final value of I to which the curve is approaching may be different at different times. In a curve, for instance, which ultimately approaches zero the application of the empirical absorption formula to the early part of the curve may lead to a negative value for I. Methods outlined in an appendix enable the values of those quantities to be obtained notwithstanding these vagaries.

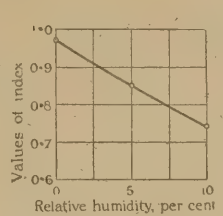

Fig. 8.—Variation of n with Humidity.

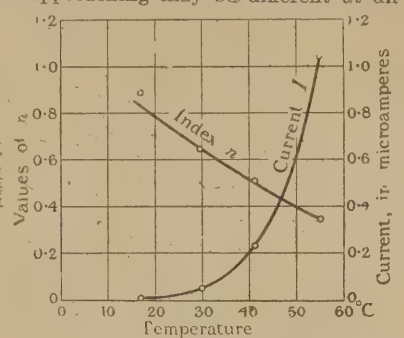

Fig. 9.—Impregnated-paper Cable; Variation of n and I with Temperature.

Quite a large number of tests have been carried out on various types of impregnated-paper cables, and fig. 5 shows the charging currents obtained on three samples of oil at 40 deg. C. The samples were mixtures of two ingredients used in the manufacture of cables. In order to investigate the effect of moisture content on dielectric absorption it is, of course, necessary to choose a dielectric in which the moisture content can be conveniently controlled during the test; the selection ultimately fell on celluloid as being homogeneous, subject to humidity conditions and yet changing so slowly as to make handling during the tests practicable.

Fig. 6 shows the definite connection between the dielectric resistance and the relative humidity of the atmosphere under which the samples were stored. In fig. 7 the logarithm of the dielectric resistance of the extreme cases is plotted against temperature (the other cases lie between) and the results indicate that the law connecting dielectric resistance and temperature is the same for all humidities: it is $R_\theta = R_0 e^{-0.06\theta}$ where R_θ = resistance at θ°C.; R_0 = resistance at 0°C.; and θ = temperature, °C.

The variation of the index n with the relative humidity of the controlling atmosphere is shown in fig. 8; the presence of moisture lowers the value of n, and it seems probable that if No. 1 sample had been perfectly dried its index would have been unity.

The values of n and I are plotted in fig. 9, from which it will be seen that raising the temperature of a paper cable reduces the value of the absorption index.

(To be continued.)

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

Safeguarding of Industries Act.—We have received the following communication from Messrs. Leopold Farmer and Sons :—"It may be of interest to your readers to learn that whenever any move is made by the Government for protection of trade, this is immediately reflected by the inquiries made in England from foreign firms regarding conditions for manufacturing in this country. Since there is a new movement on foot to extend the scope of the Safeguarding of Industries Act for the better protection of English manufacturers, we are able to report many inquiries, and negotiations in hand with foreign firms to establish works in this country. There is no doubt that should they decide to locate themselves here, they would not only be able to use the trade mark, 'Made in England,' but obtain preference in rates in shipping to our Colonies. Messrs. Citroën, makers of motor-cars, have definitely acquired a manufacturing property at Slough, and other well-known motor firms and tire manufacturers are negotiating for areas of land on which to build works. If the Safeguarding of Industries Act is extended, a good many other firms will have to operate here. Our experience of the alteration in the Patents and Designs Act, 1909, which compelled the foreign holder of an English patent to manufacture it here, resulted in the establishment of some 100 new works in this country, in addition to the extension of English manufacturers' plants for manufacturing the patents on licence. These operations absorbed additional labour, helped to develop new areas, provided increased rates to local authorities and were of considerable financial benefit to the country as a whole."

The Shannon Scheme Dispute.—Our Dublin correspondent states that the return of Mr. McGilligan, the Free State Minister of Industry and Commerce, from the United States, will probably lead to the adoption of stern measures to end the dispute which is holding up the Shannon hydro-electric scheme. A number of members of the National Ex-Servicemen's Organisations have accepted employment at Limerick with the contractors, Messrs. Siemens, Schuckert & Co., while it is stated that the firm has in hand over 5,000 applications from men who are willing to work on the scheme if permitted to do so. A further 60 German engineers and mechanics recently arrived at Limerick and a German vessel which was unable to discharge its cargo for some time has now been unloaded and has returned.

Football.—On Saturday last the Dussek Bitumen Co., Ltd., defeated the Union Cable Co., Ltd., at Dagenham, in the third round of the London Junior Cup.

Metropolitan-Vickers Colliery Winders.—The Metropolitan-Vickers Electrical Co., Ltd., recently claimed that it had supplied 78 per cent. of the electric winders installed in the Northumberland and Durham coalfields. Since then further orders have been received from this area, other British coalfields, and a number of South African mines.

An Important Canadian Contract.—The *Electrical News* (Toronto) reports that the Canadian Westinghouse Co., Ltd., has received a contract for the electrical equipment of a pulp and paper mill at Peribonca, Quebec, the construction of which is estimated to cost 3½ million dollars.

Commercial Electrical Travellers.—A well-attended meeting of the Electrical Trades Commercial Travellers' Association was held on October 30th at the E.L.M.A. Rooms, Savoy Hill. The subject under discussion was "Salesmanship," and Mr. V. Dale's paper, to which we refer more fully on another page, was much appreciated. Mr. A. E. Joyce presided, and Mr. H. Whynn Roberts, vice-president, opened the discussion. The next social event will be held on Saturday, November 21st, at the Manchester Hotel, and will take the form of a whist drive and concert.

The E.L.M.A. Design Course.—A number of contractors who attended the last illumination design course arranged by the Electric Lamp Manufacturers' Association have, through the secretary of the Electrical Contractors' Association (Mr. L. G. Tate), expressed their thanks to the Lighting Service Bureau for the full and useful information put before them at the course.

Shop-window Lighting.—The accompanying illustration is a night view of the window of Messrs. Walker Bros., electrical engineers, Temple Row, Birmingham, and, as the picture

A "Siemens" Window.

shows, is a very dignified display. The lighting was carried out with "Siemens" shop-window reflectors and gasfilled lamps, and all the electrical domestic appliances displayed are "Siemens-Xcel" apparatus.

City Electricity Charges.—At last week's meeting of the Corporation of the City of London, Mr. Deputy Sandle stated that while the Charing Cross Electricity Co. had reduced the price of energy for heating and cooking, there was also room for a reduction in the charges for lighting and power. The reductions made in response to representations by influential City bodies only affected a small proportion of the consumers in the City. Although the company stated that the high prices were due to increased rates on its premises, it was now paying £11,146 as against £16,118 in 1921. The maximum price of 6d. per kWh for lighting compared unfavourably with the charge in other parts of London and the larger provincial cities. Mr. Sandle quoted Cape Town as an example of a provider of cheap electricity in spite of the difficulties with which the Municipality had to contend. He regretted that the Corporation had abandoned its option to purchase the undertaking. If justice could not be got for City consumers, Parliament should be asked to pass a Bill allowing the City to run an undertaking of its own, or to obtain supplies from some other authority. Mr. J. R. Pakeman said that it had been considered that it would be unwise for the Corporation to exercise its right to purchase the undertaking. There were explanations in several respects of some of the statements made by Mr. Deputy Sandle.

Eventually the Corporation passed Mr. Deputy Sandle's motion, and it was decided to send copies of the resolution to the two electricity supply companies, the Minister of Transport, and the Electricity Commissioners.

The Timber Market.—Our timber trade correspondent informs us that the market for wood for general utility work is much firmer than when we reported on it a few weeks ago. Stocks are still fairly large, but the consumption continues to steadily increase, and the general improvement of trade will have much to do in still further enlarging the demand for wood for all building construction, and for box and packing case work. A further influence on the steadiness of prices is that the meteorological conditions in the north of Europe foretell an early close of navigation. If such prove true, much of the timber that would otherwise have come forward to this country will over-winter at the shipping ports, and the fairly large stocks would thus be only moderate to carry us through the winter months. In poles for wireless work the market is fairly reasonable, and now that we have arrived at what must be considered the busiest time for the wireless form of entertainment and study, the demand for poles should increase. Those firms who manufacture woodwork from hardwoods will also find that the market is steadily firming up. This is especially so for teak, as well as hardwoods from the United States, such as mahogany, ash, oak, maple, walnut, and satin-walnut, for all of which shippers are asking firm rates. Mahogany from British Honduras, Central Europe, and West Indies and West Coast of Africa is also a very strong market, of which those firms who are manufacturing woodwork in that material should take note.

The British Industries Fair.—Over 50,000 invitations from the Department of Overseas Trade for the forthcoming British Industries Fair at the White City, London, and Castle Bromwich, Birmingham, are being issued to overseas buyers in all parts of the world, apart from the very large number of invitations which will shortly be addressed to home buyers. The Department of Overseas Trade has compiled, within recent years, an exhaustive index of buyers of all classes of goods exhibited at the Fair. This index, to which additions are constantly being made, comprises at present some 50,000 names of overseas buyers. Of the more important markets there are some 2,000 firms in Australia and New Zealand on the list of the Department, 2,168 in Canada and Newfoundland, over 3,000 in South America, and 5,000 in the United States. To all firms on this list and to any other firms that the exhibitor may indicate, a series of two letters is sent in the appropriate language. Further, the overseas officers of the Department, who are stationed in every country of the world, and who have in their possession a list of the buyers in their particular districts, have been requested to notify the Department of all buyers who intend visiting the Fair, and, if possible, the date of their arrival in England, so that, as far as possible, arrangements may be made for their reception and entertainment. All who do not receive their invitations within the next few days should apply direct to the nearest British representative, Trade Commissioners in the Dominions and Colonies, and Commercial Secretaries or Consuls in other countries, or the Exhibition Branch, Department of Overseas Trade, 35, Old Queen Street, S.W.1.

Local Exhibition.—Hebden Bridge.—An exhibition of electric lighting and domestic labour-saving appliances, held under the auspices of the local electricity department, was opened on October 26th, at the Co-operative Hall, by Mr. E. Hartley, chairman of the Electricity Committee of the District Council, with the Chairman of the Council (Mr. A. Sutcliffe) presiding. The exhibition was held in connection with the celebration of the "coming-of-age" year of the local electricity undertaking, and the opener made reference to the great progress in electricity for domestic purposes and in that undertaking particularly.

Patent Application.—Application has been made for the restoration of Patent 173,529 of 1921, granted to Quarz-Lampen-Gesellschaft m-b-H. for "Mercury Vapour Apparatus and more especially Quartz Lamps."

More Electric Locomotives for South Africa.—As was briefly stated in our last issue, a contract for 17 locomotives, with spares, totalling upwards of £250,000 in value, has been placed by the South African State Railways with the Metropolitan-Vickers Electrical Co., Ltd. The new locomotives will be duplicates of 78 locomotives originally ordered from the same company in 1922 and put into commission during the last two years. The locomotives are of the "AA+AA" type, each weighing 66½ tons, having been equipped with four 300-h.p. motors, and giving 40,000 lb. maximum and 16,400 lb. continuous tractive effort. The track is a very difficult one. The gauge is only 3 ft. 6 in., and the gradients are heavy, since the altitude of the line varies between 2,200 and 5,000 ft. above sea level, and the track winds with many sharp curves. For these reasons, and as the loads to be hauled are very heavy,

Metropolitan-Vickers Locomotives in South Africa.

provision is made for three locomotives to be attached to each train. The locomotives are arranged for multiple-unit control from a single cab, and also with this system of control regenerative braking is provided for the first time in large-scale operation. We understand that the design has proved entirely satisfactory both in the special tests to which the locomotives were submitted and in actual service. Power is supplied to the locomotives at 3,000 V direct current from overhead contact wires, and the standard track return is used. The supply of direct current is obtained from a number of sub-stations placed along the line, which convert to direct current from a 3-phase overhead transmission system at 88,000 V. The total length of the Glencoe-Pietermaritzburg section of the railways to be electrically equipped is 171 miles, and of this the electrification of over 100 miles is now completed.

Trade Announcements.—MESSRS. C. W. BURKILL & Co., wireless engineers, Station Road, Castleford, have opened a new branch business at 2, Albion Street, in that town.

MR. JOSEPH SHAW, electrical engineer, has opened new showroom premises at Stamford Street, Ashton-under-Lyne.

MESSRS. L. MCMICHAEL have now become installed in their new works and offices at Wexham Road, Slough. Their telephone Nos. are: "Slough 441 and 442," and their telegraphic and cable address is "Radiether, Slough."

The FOSTER ENGINEERING CO., LTD., has opened a new branch at 140b, Victoria Street, Bristol, with Mr. W. J. Murphy as manager.

Catalogues and Lists.—MESSRS. WARD & GOLDSTONE, LTD., Frederick Road, Pendleton, Manchester.—Radio catalogue No. 113, containing illustrations and prices of complete sets, components, and accessories. Also an illustrated pamphlet dealing with the "Goltone" 8-valve super-heterodyne receiver.

MESSRS. A. REYROLLE & Co., LTD., Hebburn-on-Tyne.—Brochure No. 521/9-25, containing fully-illustrated details of the "Peebles-Reyrolle" automatic motor-converter sub-station equipment.

MESSRS. L. G. HAWKINS & Co., LTD., 30-35, Drury Lane, W.C.2.—A folder advertising the "Millerette" totally-enclosed lighting unit.

THE POWER EQUIPMENT CO., LTD., Kingsbury Works, The Hyde, Hendon, N.W.9.—Illustrated pamphlets describing "Powquip" radio transformers and coils.

MESSRS. SIEMENS BROS. & Co., LTD., Woolwich, S.E.18.—Pamphlet 820A, illustrating and describing the company's thermo-electric pyrometers for use up to 1,400 deg. C.

THE MIDLAND ELECTRIC MANUFACTURING CO., LTD., Barford Street, Birmingham.—An illustrated and priced catalogue of the company's ironclad switch- and fuse-gear.

THE SUN ELECTRICAL CO., LTD., 118-120, Charing Cross Road, W.C.2.—A comprehensive illustrated catalogue of radio apparatus of many makes, and separate pamphlets dealing with "Marconiphone" variometers, receivers, and amplifiers.

THE GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, W.C.2.—Leaflet No. O.S. 3406, containing illustrations and prices of "Osram" colour-sprayed gasfilled lamps.

PHILIPS LAMPS, LTD., 60, Wilson Street, Finsbury Square, E.C.2.—A booklet entitled "Light on Lamps," describing the production of "Philips" lamps.

MESSRS. JAMES GORDON & Co., LTD., Windsor House, Kingsway, W.C.2.—Catalogue "H," describing complete plant for the development of water power, including turbines, Pelton wheels, governors and pipe lines. A great deal of hydro-electric data is embodied in the publication.

VENNER TIME SWITCHES, LTD., 45, Horseferry Road, S.W.1.—List No. 26, describing the "Venner" stop watch for use in testing.

PYREX ENGINEERING CO., Adelaide Buildings, Docks, Cardiff.—Two illustrated booklets dealing respectively with "Mema" electric drilling machines and "Wex" a.c. welders and rivet heaters.

MESSRS. FERRANTI, LTD., Hollinwood, Lancs.—Pamphlet Wa401, showing the amplification ratio of the "Ferranti" intervalve transformer, type "A.F.3," throughout the whole of the musical scale, and explaining the correct use of the component.

KLAXON, LTD., 36, Blandford Street, Marylebone, W.1.—A booklet describing examples of "Klaxon" apparatus for factories, mines, and other industrial purposes.

THE MICA MANUFACTURING CO., LTD., Volta Works, Bromley, S.E.—A price list of various classes and quantities of mica which the company has for disposal.

HERBERT MORRIS, LTD., Loughborough.—A folder advertising "Morris" electric hoist blocks.

STANDARD TELEPHONES AND CABLES, LTD. (formerly Western Electric Co., Ltd.), Connaught House, Aldwych, W.C.2.—A handsome coloured showcard advertising the "Kone" loudspeaker.

MR. N. W. J. GORRILL, 40, Bromar Road, Camberwell, S.E.5.—A price list of wiring materials and accessories, including some radio apparatus.

Bankruptcy Proceedings.—W. K. COXON and E. R. WEARE, trading as the Western Manufacturing Co., Nurshill, Lydney, Glos., radio apparatus manufacturers.—The first meeting of creditors was held on November 4th at 34, Park Place, Cardiff. The statement of affairs showed ranking liabilities of £2,028, against net assets of £1,427, leaving a deficiency of £601. Debtors attributed their failure to over-advertising, over-purchasing, and the slump in trade. The matter was left in the hands of the Official Receiver (Mr. Ellis Owen) as trustee of the estate.

J. WILSON, electrical engineer, 70, Ebrington Street, Plymouth.—Receiving order made October 30th on debtor's own petition.

C. W. A. ASHWORTH, electrical engineer, West Street, Oundle.—First and final dividend of 8¾d. in the £ payable at the Official Receiver's office, 5, Petty Cury, Cambridge.

V. REED, electrical engineer, 10, Chapel Road, Eastville, Bristol.—Receiving order made November 4th on creditor's petition.

B. UTTLEY, electrician, Tower Street, Bacup.—First meeting November 13th, at the Official Receiver's offices, Byrom Street, Manchester. Public examination November 27th, at the County Police Court, Rochdale.

W. P. YOUNG (W. P. Young & Co. and Leicester Tanning Machinery Co.), mechanical and electrical engineer, 40 and 42, Sanvey Gate, Leicester.—Application for discharge to be heard on December 3rd at The Castle, Leicester.

P. L. SYMONDS, electrician, 4, Victoria Road, Great Yarmouth.—First and final dividend of 4s. 7½d. in £ payable at the Official Receiver's office, 9, Queen Street Chambers, Norwich.

A. THOMPSON (Arnold Electrical Co.), electrical and mechanical engineer, 38, Lucy Street, Hulme, Manchester.—First and final dividend of 1s. 2¼d. in the £ payable November 16th at the Official Receiver's office, Byrom Street, Manchester.

Company Liquidations.—MERCHANTS & AGENCIES, LTD., importers and wholesale dealers in radio apparatus, 38, Great Russell Street, W.C.1, late of Basinghall Street, E.C.—A meeting of creditors was held on November 5th, when an approximate statement of affairs was presented showing the position as at October 16th last, on which date a resolution for voluntary liquidation was passed by the shareholders. The statement disclosed ranking liabilities of £7,825 and net assets of £2,889, leaving a deficiency as regarded the creditors of £4,936. Mr. J. S. B. Hole (Messrs. Oscar Berry & Co.), stated that the company was registered on September 15th, 1923, with a nominal capital of £3,000 in £1 shares. The primary object of the company was to enter into, and carry into effect, an agreement with Mr. H. S. Leben, and at the date of the liquidation Mr. H. S. Leben was the sole director. After allowing for all the expenses the company had carried on business throughout at a net loss of £4,024. The deficiency as regarded the shareholders was £6,984. In answer to a question, Mr. HOLE stated that at the date of the liquidation there were a number of contracts running for the supply of goods, and articles were arriving in London almost daily. The liquidator had been able to take up some small parcels and had arranged for others to be taken up, with the result that the contracts had been continued. At the moment there was only one contingent claim for breach of contract. A resolution was passed in favour of an application being made to the Court for the appointment of Mr. Charles Lathan, of 78, New Oxford Street, W., as liquidator. The following are creditors:—

	£		£
Berliner & Co.	2,725	Inland Revenue	45
Zeiler	2,588	Woolland & Co.	37
Ahemo	664	Youels, Chant & Co.	31
Marleco	426	Lawrence, W. P.	28
Titania	322	Sankey, W. A., & Co.	26
Kurz, E., & Co.	274	Sponholz, Ltd.	25
Cotzin Bros.	250	Leben, Henry	25
Albion Co.	148	Leben, Mrs. H. S.	20
Frelat, N. V.	52		

CLEVELAND ELECTRICAL ENGINEERING CO., LTD.—Meeting of creditors November 16th, at 29, Grange Road West, Middlesborough. Liquidator, Mr. M. McGilligan.

ANGLO-POLISH ELECTRICAL DEVELOPMENT CORPORATION, LTD.—A meeting of members is called for December 9th, at 603, Australia House, Strand, W.C., to hear an account of the winding up from the liquidator, Mr. E. N. Humphreys.

METRODES, LTD.—Winding up voluntarily. Liquidator, Mr. J. Henderson, 6, East Parade, Sheffield. A meeting of creditors was called for November 11th. Particulars of claims to the liquidator by November 30th.

TOPSHAM ELECTRICITY SUPPLY CO., LTD.—Meeting of creditors, November 18th, at 23, Catherine Street, Exeter.

SUTHERLANDS (ELECTRICAL ENGINEERS), LTD.—A meeting of members is called for December 10th at 20, Acresfield, Bolton, to hear an account of the winding up from the liquidators, Mr. A. Greenhalgh and Mr. J. O. Young.

NEW ROTTINGDEAN ELECTRICITY CO., LTD.—A meeting of members is called for December 12th, at Union Bank Chambers, 8, North Street, Brighton, to hear an account of the winding up from the liquidator, Mr. H. B. C. Baldwin.

Dissolution of Partnership.—HUNTER, OGLE & Co., electrical engineers and manufacturers' agents, 174, Corporation Street, Birmingham.—Mr. T. H. Hunter and Mr. J. G. Ogle have dissolved partnership. Mr. Ogle will attend to debts and continue the business under the same style.

Swiss Financing of Foreign Undertakings.—The directors of the Bank for Electrical Undertakings of Zurich, in the course of their annual report for 1924-25, state that a circumstance which still suggests the adoption of increased caution, especially in connection with the financing of electrical undertakings in other countries, lies in the constant tendency of State and municipal authorities to consider the supply of electricity as if it were a public benevolent institution, thus causing electricity producing and distributing companies the greatest difficulty in the fixing of sufficiently high tariffs. Among the numerous transactions submitted to examination in the past year the bank restricted itself chiefly to further participation in Austrian electricity companies. Further satisfactory results attended the efforts to combine financial operations abroad with contracts for the delivery of plant to be allotted to Swiss firms.

New French Company.—La Société des Véhicules et Tracteurs Electriques (Vetra) has lately been formed in Paris (186, Rue du Faubourg St. Honoré) with a capital of 300,000 fr., to manufacture electric vehicles and tractors.

Belgian Congo Company.—A new company is in course of formation in Brussels with a capital of 75 million francs and the title La Société Générale des Forces Hydro-Electriques de Katanga, to develop the water power resources of the Belgian Congo.

Removal of Foreign Loan Embargo.—In the course of a speech at Sheffield last week, the Chancellor of the Exchequer stated that the Government intended to remove forthwith the embargo upon the flotation of Dominion and foreign loans in the London money market. It is generally considered that the removal of the embargo will have a beneficial effect upon British trade and industry. In an interview with the *Financial News*, Mr. R. T. Nugent, director of the Federation of British Industries, said that the Federation was delighted to see the removal of the embargo. "An increase in foreign investment will inevitably result sooner or later in the export of British goods. The lifting of the embargo marks the final step in the return to more normal conditions, removing as it does the last artificial barrier to a free gold market." Asked if he considered that we should have waited until the import season was over, Mr. Nugent replied that he did not expect any immediate rush for loans, and that he did not consider the removal premature. He emphasised the fact that all foreign investments must help our export industries—some more quickly than others. In any case, the ultimate effect would be beneficial to all our industries. There were grounds for anticipating a marked improvement in trade within the next twelve months —not a boom—but a steady recovery.

Brighter London.—Four 5,000-W Philips lamps, hung on the Holborn Empire, have made the High Holborn district the lightest spot in the Metropolis. Each of the lamps is of 10,000 candle power.

South African Tariff Decision.—The South African Commissioner of Customs has recently ruled that lamps and self-starters imported into the Union attached to motor chassis are not classifiable as parts of the chassis but are dutiable separately under their appropriate tariff items.

Sales to Receivers and Managers.—Suppliers of goods are frequently in doubt as to the execution of orders given by receivers and managers appointed by the debenture-holders of companies. To assist its members the Wireless and Radio Trades Guardian Association has sent them a circular which helps to clarify the situation. It is pointed out that receivers and managers are of two classes—those appointed by the Court and those appointed by the debenture holders themselves. A receiver of the first class is virtually a Court official and cannot be absolved from personal liability for goods ordered under his direction, although in some cases attempts have been made to evade personal responsibility. The second class of receiver is usually the agent of the company and is not personally liable, nor are the creditors for goods entitled to look to the assets in his possession for payment of their accounts, for these assets are the property of the debenture holders. It is considered that in the case of a receiver not appointed by the Court the safest plan is to have all orders signed by him personally and not as receiver and manager, and invoices, &c., should be made out to him personally, or his personal guarantee obtained.

A Battery Calculator.—Messrs. Pritchett & Gold and E.P.S. Co., Ltd., have produced a handy little device by means of which the type and size of accumulator to order to give required results when made up into 100, 50, or 25-V batteries can be ascertained. It consists of a celluloid slip in a case of the same material. The appropriate sets of figures appear in perforations at the edge of the case when the slide is adjusted.

Book Notices.—"Charles Letts's Engineering Diary, 1926." London: Charles Letts & Co. Price 3s.—This is the fourth publication of this useful and interesting pocket-book, which has been brought up to date with many improvements and additions. Many valuable data are contained therein, including electrical, mechanical, chemical, relating to the distinctions and abbreviations of the professional institutions, &c. The usual mathematical and decimal and metric tables, together with conversion tables, are also included, while much general information, including foreign currency particulars, train and postal rates, &c., adds greatly to the value of the book. It is bound in a neat leather cover.

"Scientific Papers of the Bureau of Standards, No. 510 (Part of Vol 20)."—Effect of Wear on the Magnetic Properties and Tensile Strength of Steel Wire. Price, 5 cents.

"*Journal* and Record of Transactions of the Junior Institution of Engineers." Vol. XXXVI. Part II. November, 1925. Price, 2s.

A Tall Order.—Messrs. Hoover, Ltd., in response to their offer to give a free demonstration with their cleaner to Burnley people, have received a coupon signed by a gentleman in Nigeria. An accompanying letter said:—"I thank you very much in advance. Kindly let me have it with the next coming mail."

German Contract for Harbin.—It is reported from Berlin that the Siemens-Schuckert Works Co. has concluded an agreement with the holders of the tramway concession in Harbin for the delivery of tramway equipment, including motors, cars, rails, and other material, special guarantees having been assumed on both sides for the fulfilment of the agreement. Banks at Harbin have played the part of intermediaries in the transaction, and emphasis is laid upon the fact that the agreement has an exclusively commercial character. The financial side of the matter lies in the hands of the concessionnaires. On the other hand, it is stated that the Japanese Harbin Co. for Electrical Undertakings in North Manchuria has raised objections to the prolongation of the concession for the Harbin tramway and against the allocation of the order without competition.

Irish Free State Electrical Imports.—The official returns just issued show that the imports of electrical goods (excluding machinery) into the Irish Free State during July last, amounted to £23,358, as compared with £27,173 in July, 1924. The figures for the first seven months also show a marked shrinkage in electrical imports—from £244,075 in 1924 to £182,502 this year.

The Italian Cable Industry.—An interesting report on the production and sale of insulated wire and cable in Italy has been furnished to the French Government by its Commercial Attaché. The Italian manufacture of insulated wire and cable had its origin in Milan in 1879, the year in which the house of Pirelli established in that city a small factory of modest proportions. For many years the history of the industry was merely the story of the progress of this works and the branch establishment created in 1886 for the production of submarine telephone and telegraph cables. At the present time there are seven installations of this kind in Italy; two being situated at Milan, and one each at Turin, Genoa, Spezia, Leghorn and Naples. The industry has advanced greatly in importance during the past 20 years. Although it employs a total of not more than 5,000 workpeople, it is one of the most important manufacturing industries in the country, and is in a position to cover practically all the requirements of home consumers and also to carry on a considerable export trade. This latter branch of activity is the more remarkable, inasmuch as the greater part of the raw material employed in the industry must be imported. Practically all descriptions of wires and cables are produced from flexible cords up to high-pressure power cables and submarine telegraph and telephone lines. Whilst in recent years exports have been maintained at a high level imports are only about half as large as they were before the war; figures in quintals being as follows:—Exports: 1914, 33,727; 1920, 44,929; 1921, 20,392; 1922, 11,149; 1923, 25,112; 1924, 24,279. Imports: 1914, 8,375; 1920, 617; 1921, 2,428; 1922, 2,814; 1923, 891; 1924, 4,760. Insulated wire and flexible cord of Italian manufacture are exported to practically every country in Europe, whilst cables find their most important markets in South America, notably Argentina, Uruguay, and Brazil. Nearly all Italy's imports of these classes come from Great Britain.

Belgian Import Requirements.—The *Board of Trade Journal* states that in consequence of the conclusion of a commercial agreement between Germany and Belgium, the list of goods in respect of which certificates of origin are required in order to obtain "minimum" tariff treatment on importation into Belgium has been considerably reduced. The published list, however, shows that many classes of electrical goods are still subject to the requirement.

United States Electrical Exports.—According to *Commerce Reports* exports of electrical machinery and equipment from the United States during August were valued at $8,074,352—an increase of $885,982 over the corresponding month of 1924, being the highest total reached in any month since May, 1921. As compared with the same month of 1924 there was a considerable decrease in shipments of power-generating and distributing equipment during August, except in the cases of power transformers, which were practically doubled, and switchboards and switchgear, in which there was a large increase. The rises in these items more than counterbalanced the losses in generating plant. Motors of all classes, together with equipment and accessories, showed a satisfactory increase, especially in the case of railway motors, the value of which rose from $24,634 in August, 1924, to $192,211 in August, 1925. In the latter month no electric railway locomotives were exported. In the case of domestic electrical appliances, an all-round increase of small dimensions occurred, although there was a decrease in the exports of house-wiring material. Radio apparatus again showed a very large increase, the figure rising from $541,238 to $844,379—an increase which more than offset the decreases in other communication equipment. Batteries also showed a remarkable rise, no doubt consequent upon the increase in exports of radio apparatus. Industrial and electric furnaces and ovens, carbon products, flash lights and therapeutic apparatus, all showed satisfactory increases in quantity and value. Decreases included telephone and telegraph equipment, signalling apparatus, and insulating material.

Unemployment.—The registers of the Employment Exchanges for the week ended October 26th showed a fall of 5,758 in the number of unemployed, the total at that date being 1,232,400.

The Tientsin Electrical Market.—In a recent article upon the growth of the electrical undertaking of the British Municipal Council at Tientsin, the *Peking and Tientsin Times* gave several indications of openings for electrical apparatus. It was stated that refrigerators were likely to be in great demand shortly, but only American firms were taking advantage of the opportunity. Cooking appliances, especially those adapted to the preparation of rice, were becoming popular, and electro-medical apparatus for personal use had a large sale in the Far East. The demand for washing machines (from American sources) threatened to exceed the supply. The article complained that British manufacturers did not seem to realise the potential market which the Far East offered with regard to what was "obviously going to provide big business," although Germans and Americans were constantly pursuing inquiries in furtherance of their chances in so fast-growing a trade.

For Sale.—Edinburgh Corporation electricity supply department invites offers for 20 tons of clean scrap copper wire. (See our advertisement pages to-day.)

American Mine Locomotives for Russia.—It is reported from New York that the Westinghouse Electric International Company announces that the Amtorg, which represents the Soviet Government, has placed an order for the delivery of 25 electric locomotives for use in connection with the electrification of the Donetz coal mines. This is the first order of the kind which has been allotted to the United States.

The German Cable Industry.—According to a report issued at the end of last month, the German cable manufacturing industry shows signs of becoming worse. This is attributed to the lack of private orders, particularly from abroad. As is known, the contracts placed by the postal and telegraph administration represent the most important orders for the industry, but as the latter possesses plant in excess of that necessary to execute the orders given by the State departments, it depends to a large extent upon private orders. These have been practically lacking for some time past, and the cable factories have therefore executed the State orders quickly with the object of avoiding an increase in the costs of production which would have resulted from running at "part load." It thus happens that the State orders, which at the beginning of the financial year are allotted to the cable factories in accordance with the Budget estimates, are now being delivered, although, under the contracts, they are not due for delivery for some three to six months. The post and telegraph authorities, however, are unable to pay for the cables before the pre-determined time, to say nothing of placing fresh orders for the year 1926-27. Proposals which were recently made in this direction by the cable manufacturing interests to the ministries concerned met with a negative reply, although the official departments know that difficulties will consequently arise for the cable industry, which will lead to dismissals of workmen. In this connection it is mentioned that restrictions in the number of workmen have already taken place at the works of the Felten & Guilleaume Company, of Cologne-Mulheim, although this company is probably one of the best occupied owing to the manufacture of the Azores submarine cable. The other cable factories will also presumably have to have recourse to discharges, as the working capital is tied up in the orders executed for the State and not yet paid for, and further working for stock is out of the question in consequence of the scarcity of capital, as was, for instance, referred to in the recent annual report of the Rheydt Cable Co. These difficulties are not individual, but apply to the cable industry without exception. Nevertheless, the hope is still entertained that the negotiations with the authorities for premature payment for the deliveries may yet lead to the adoption of an accommodating attitude so that the discharge of workmen will be avoided.

Suspension of Nicaraguan Import Duty.—The Nicaraguan Government has recently suspended the import duty on dynamos, generators, motors, and similar machinery.

Lighting and Power Notes.

Ashton-under-Lyne.—NEW ELECTRICITY CHARGE.—With a view to encouraging the greater use of electricity by householders the Corporation Electricity Department is to sell electricity on the basis of 15 per cent. on the assessment of the house, plus ½d. per kWh against the existing price of 5d. per kWh. It is hoped later to extend the scheme to houses attached to business premises.

Audenshaw.—STREET LIGHTING.—The Urban District Council is to approach the Manchester Corporation with a view to obtaining a quotation for lighting the main thoroughfares by electricity.

Australia.—COLLIE (W.A.).—According to the *Electrical Engineer of Australia and New Zealand*, a deputation which waited on the Premier of Western Australia recently urged the erection of a power station on the Collie coalfield to supply energy to Collie, Bunbury and the intermediate districts. The scheme is estimated to cost £216,650, and such a station would form the nucleus of a plant that might be expanded to 150,000 kW capacity as the demand arose. The Government is being asked to contribute half the cost.

WESTERN AUSTRALIA.—The accounts of the Government electricity undertaking for the year ended June 30th last show a total income of £185,190, as compared with £166,210 in 1923-24. Operating expenses increased from £116,150 to £133,805, and there was a gross profit of £51,385 (£50,058). After providing for capital and other charges there was a net deficit of £2,125, as compared with a surplus of £430 in the preceding year. The sales of electrical energy increased from 39,100,707 to 44,112,862 kWh, and the maximum supply demanded from 11,500 to 12,400 kW. Contracts were placed during the year for a 12,500-kW turbo-alternator and two 65,000-lb. boilers. These additions, together with other extensions, will, it is estimated, cost £239,950.

Barking Town.—ELECTRICITY IN BULK.—The Urban District Council has come to an agreement with the County of London Electric Supply Co., Ltd., for a temporary bulk supply at the rate of 9s. 2d. per month per kW of maximum demand, plus ½ per kWh, the terms to be operative until such time as the main bulk supply is available.

Bethesda.—ELECTRICITY SUPPLY.—The Urban District Council has obtained an Order authorising it to supply electricity in the district. The maximum charges are:—Summer months: Up to 10 kWh, 7s. 6d.; all energy in excess of this amount 9d. per kWh. Winter months: Up to 15 kWh, 11s. 3d.; all energy above this amount 9d. per kWh.

Burnham (Essex).—ELECTRICITY SCHEME.—The Urban District Council has accepted the offer of Mr. Purves to carry out an electric lighting scheme for the district.

Continental.—GERMANY.—It is reported that work is about to be commenced on the construction of two new hydro-electric stations to utilise the water power of the Rhine at Niederschwoistadt and Rekingen respectively. The current will be utilised for traction purposes on the Baden State railways.

CZECHO-SLOVAKIA.—According to a recent Government report, there were 385 electric power stations in operation in Czecho-Slovakia at the end of 1924, the total installed capacity being 290,182 kW. The average annual consumption of electricity per head of population was 31.8 kWh, but the completion of the Rechenberg distribution system, which extends over a wide area, is expected to raise this to 180 kWh in the near future.

FRANCE.—According to the recently-issued annual report of the Société de l'Union d'Electricité, of Paris, the sixteenth turbo-generator (40,000 kW) is now in operation at the Gennevilliers power station, and work is in hand on the installation of the seventeenth and eighteenth sets, which, when completed, will bring the capacity of the station up to 340,000 kW. In addition, the Vitry station of the company has an output of 90,000 kW. As a result of these extensions it has been found possible to close down the old station at Asnieres, near Paris; that at Puteaux is, however, being retained for the present as an emergency plant for power supply in the winter months.

BELGIUM.—The Société Intercommunale Belge d'Electricité, in its report for the year ended June 30th last, states that, in view of the increasing demand for electricity, it is arranging for further plant extensions. A new 8,200-kVA turbo-generator is being installed at its Paturages power station, one of 15,500-kVA capacity is being erected at the Malines station, a fourth set of 11,500 kVA has been ordered for the Alost station, and a fourth set for the Bressoux station.

Deal.—ELECTRICITY IN BULK.—The Deal and Walmer Gas Co. is negotiating with the Dover Corporation for a bulk supply of electricity.

Doncaster.—ELECTRICITY SUPPLY.—The Corporation is supplying electricity to householders in Bentley at a flat rate of 1s. per week.

Earby (Yorks.).—ELECTRICITY SCHEME.—The Urban District Council is canvassing residents to ascertain the number who would be willing to take an electricity supply. The charge for lighting is not expected to exceed 7d. per kWh and to small consumers of power it is expected to be 2½d. to 3d. per kWh.

At a recent meeting of the Colne Town Council, the engineer submitted draft terms for the supply of electricity in bulk to Earby and these were approved.

East Ham.—ELECTRICITY AGREEMENT.—At a recent meeting of the Electricity Committee the engineer reported that the West Ham Corporation was willing to lay at its own cost a new feeder cable from its works to the East Ham generating station, subject to the amount of the maximum demand set forth in the agreement being increased, and that, in accordance with clause 12 of the agreement, he had notified the West Ham Corporation that the maximum demand will be increased from 600 to 1,500 kW in respect of the current year.

Harpenden.—PRICE REDUCTIONS.—The North Metropolitan Electric Power Supply Co. has reduced the charges for electricity for lighting on the flat rate from 7d. to 6d. per kWh; on the maximum demand rate from 10d. and 2d. to 10d. and 1½d per kWh; for heating from 2½d. to 2d. per kWh; on the annual service rate the meter rent of 2s. 6d. per quarter is abolished.

Ilford.—LOAN.—The Electricity Committee is applying for sanction to a further loan of £2,000 for the purchase of domestic apparatus to be let out on hire.

Irish Free State.—KINGSTOWN (Co. DUBLIN).—The Urban District Council has entered into an agreement with the Blackrock Urban District Council whereby Kingstown will supply electricity in a specified area of the Blackrock urban district. It is provided that the cost of electricity to consumers in the Blackrock district shall not exceed the charge made to residents of Kingstown.

Japan.—HYDRO-ELECTRIC DEVELOPMENT.—It is reported that the Daido Denryoku Kaisha has decided to establish the Shokawa Hydro-Electric Co. with a capital of 30,000,000 yen. Two power stations, each with a capacity of 38,000 kW, are to be erected on the Shokawa river.

Kendal.—LOAN SANCTIONED.—The Town Council has received sanction to a loan of £4,000 for extensions of plant and buildings.

ELECTRICITY IN BULK.—The promoters of a manufacturing company who propose establishing works in the town and installing electrical plant, have inquired whether the Corporation would be disposed to take a bulk supply of electricity from the company.

London.—Hackney.—*Year's Working.*—We have received from Mr. L. L. Robinson, borough electrical engineer, a copy of his report together with the statement of accounts on the working of the electricity undertaking for the year ended March 31st last. The total revenue amounted to £177,275, and the working expenditure was £87,125, leaving a gross surplus of £90,150. The corresponding figures for the preceding year were £176,903, £83,453, and £93,450 respectively. To the gross surplus was added interest on investments and profit from the sale of funding loan stock, making a total of £95,000 available. Capital and other charges absorbed £68,732, and there was a net surplus of £26,268, which with a surplus of £342 on the Sales Department, was transferred to appropriation account. This was disposed of as follows:—Capital expenditure defrayed from revenue, £15,898, borough fund, £10,712. The previous year's working resulted in a net profit of £30,798. The amount spent on capital account during the year was £75,989, the largest items being £21,637 for machinery and plant, and £24,457 for mains and services. The sales of energy increased from 22,199,398 to 24,763,274 kWh, and the average price obtained fell from 1.83d. to 1.64d. per kWh. The maximum supply demanded rose from 12,200 to 13,439 kW.

Hampstead.—The Borough Council is to expend an additional £3,000 on "free wiring" during the current year, making a total of £6,000 in all. Mr. J. Leadbeater, the borough electrical engineer, informs us that as the result of the introduction of this scheme 1,000 new consumers have been added to the system.

New Zealand.—Dunedin.—The accounts of the City Council's electricity undertaking (engineer, Mr. M. C. Henderson) for the year ended March 31st last, show a total revenue of £130,186, as compared with £120,886 in the preceding year. Working expenses amounted to £47,328, as against £46,346, leaving a gross profit of £82,858 (£74,541). After deducting capital charges there was a net surplus of £20,888, as compared with £17,636 in 1923-24. A total of 23,120,680 kWh was sold, as against 21,701,942 kWh in the preceding year, and the connections increased from 26,698 to 29,463 kW. A 5,500-h.p. turbine coupled to a 3,000 kW alternator was put into service during the year, and work on the installation of a 3,000-kW set was commenced. When this is completed the station will have a capacity of 11,000 kW.

Portsmouth.—Loan.—The Town Council is applying for sanction to the borrowing of £35,000 for mains.

Preston.—Extension of Supply.—The electricity supply from Preston to Leyland was recently formally inaugurated by the chairman of the Electricity Committee. The industrial load already contracted for in Leyland includes 1,200 kW to one undertaking, and negotiations are proceeding with other concerns.

Sheffield.—Electricity Extensions.—The Electric Supply Committee has approved extensions of mains and works, at an estimated cost of £5,105, and extensions of mains for general distribution purposes costing £12,475.

Special Orders.—The Electricity Commissioners have submitted to the Minister of Transport for confirmation a Special Order made by them amending the Pontypool Electric Lighting Order, 1895, granted to the Pontypool Electric Light and Power Co., Ltd., and suspending the power of the local authority to purchase the undertaking authorised by that Order.

Application has been made to the Commissioners by the Whitchurch (Salop) Gas Co., Ltd., for an Order authorising it to supply electricity in the urban and rural districts of Whitchurch and the rural district of Malpas.

Torquay.—Electricity Supply.—At a recent meeting of the Electricity Committee the engineer reported that in order to provide for the increasing use of electricity in the Newton Abbot district, further provision would have to be made in the power station, either in the form of an additional rotary converter or by the installation of transformers to convert a portion of the Newton Abbot distributing network from d.c. to a.c. He recommended the latter scheme, and the Committee instructed him to proceed with the work subject to his submitting estimates of the cost in due course, with a view to application being made for sanction to the necessary loan.

Loans Sanctioned.—The Electricity Commissioners have given their sanction to loans of £1,700 for mains and £1,950 for plant in connection with the supply to Stoneycombe Quarry.

United States.—Electrical Development.—The *Financial Times* states that plans have been completed for the financing and carrying out of a hydro-electric scheme in the heart of the Ozark Mountains in Missouri. The project will be one of the largest in America. The recently-formed Missouri Hydro-Electric Company will undertake the work, which calls for harnessing the Osage River and tributaries and for the construction of several large lakes, one of which will be the largest artificial lake in the world, having a shore line of 260 miles. The cost of the scheme is estimated at $50,000,000.

According to *Power*, work is to commence immediately on the installation of additional plant at the Long Beach steam power station of the Southern California Edison Co. The additions will comprise a G.E.C. single-cylinder-type turbine rated at 50,000 kW, 50 cycles, 3 phase, 11,000 V, seven 375-lb. Stirling-type Connelly boilers, and Westinghouse condensers. The estimated cost of the additions is $6,000,000, and it is expected that the work will be completed by July, 1926.

Winchester.—Year's Working.—The accounts of the city electricity undertaking (engineer: Mr. R. Ayton) for the year ended March 31st last record a total income of £32,989, as compared with £31,971 in the preceding year. Working expenses amounted to £21,678, as against £19,680, leaving a gross profit of £11,311 (£12,291), to which was added bank interest, making a total of £11,472 available. After providing for capital and other charges, a net surplus of £2,212 remained, as compared with £2,781 in 1923-24. The energy sold increased from 1,950,208 to 2,009,986 kWh.

Tramway and Railway Notes.

Australia.—New South Wales.—According to the *Industrial Australian and Mining Standard*, after meeting interest charges amounting to £5,343,318, there was a total deficiency of £69,142 on the transactions of the New South Wales railways and tramways for the year ended June 30th last. The deficiency was made up as follows:—Railways, surplus, £32,937; tramways, deficiency, £102,079. The report of the Commissioners states that the net earnings were adversely affected by further reductions in freight rates during the year, increases in wages and salaries, and also by previous reductions in rates and fares. The report adds that the railway and tramway earnings amounted to £20,388,724, and working expenses to £15,114,548, leaving a balance of £5,274,176, which had been paid into consolidated revenue to meet interest charges. During the year 132 miles of new lines were added, and the total mileage now open for traffic is 5,655. As in the preceding report, special attention is drawn to the non-paying lines, on which there was a loss, after paying interest charges (amounting to £1,611,798), of £1,505,010. There were 55 of these lines, totalling 3,586 miles (more than 63 per cent. of the whole of the State's mileage), on which the capital expended was £32,015,994.

Barbados.—Tramway Service Discontinued.—The Bridgetown Tramways Co. has discontinued its service. The company has not been able to meet the increased competition from motor-omnibuses during the past three years, and its traffic has steadily declined.—*Commerce Reports.*

China.—Electrification Scheme Postponed.—It is reported that the scheme for the electrification of the Fushun line of the South Manchurian Railway has been postponed temporarily under the existing retrenchment policy, as the realisation of the scheme is estimated to cost 2,500,000 yen.

Continental.—Sweden.—Good progress is being made with the electrification of the railway between Stockholm and Gothenburg. Of the 50 electric locomotives ordered, 28 have already been delivered, and nine more will be completed in a few weeks. It is expected that the Hallsberg-Falkoeping section will be opened for goods traffic during the present month; passenger traffic will not begin until next year. The electrification of the whole line will probably be completed by May next year.—*Reuter's Trade Service* (Stockholm).

Switzerland.—Rapid progress is being made with the electrification of the Geneva-Lausanne section of the Swiss Federal Railways, and it is expected that the line will be completed for electrical operation by the commencement of the new year.

Austria.—The hydro-electric power station on Lake Spuller, which has been established by the Austrian State Railway authorities to supply part of the power required for the electrified Arlberg railway, has recently been completed and put in operation, the plant so far installed having a maximum capacity of 24,000 h.p. The Arlberg line between Innsbruck and Bludenz is now entirely run by electricity, and it is estimated that, in conjunction with the electrification of the Salzkammergut railway, not only will higher speed and lower maintenance costs be possible, but that there will be an economy in coal consumption of 130,000 tons per year.

Japan.—New Electric Railways.—Applications for licences from five promoters of schemes for new electric railways were recently laid before the Osaka Municipal Council. The proposed railways will serve the suburbs of Osaka and link up with the towns of Kyoto, Nara, Kobe, and Amagasaki.

India.—Calcutta.—A big scheme for the general reorganisation of the Calcutta tramway service, involving the lay-out of circular routes, a revision of the present fares and the adoption of a new system of regulating fares by stages, has been under the consideration of the Calcutta Tramways Co., Ltd., for some time past. Plans have now been completed for carrying out the proposed alterations, and it is expected that within a few months the remodelled service will be inaugurated.—*Indian Engineering.*

Leeds.—New Route.—It was reported at a recent meeting of the Tramways Committee that the new tramway to Middleton is nearly complete, and is expected to be available for service before the end of November.

Depot Extension.—The Committee has decided to enlarge the central tramway depôt in Swinegate. The present accommodation is for 55 cars, and it is proposed to extend it to accommodate 200 cars.

Liverpool.—Purchase of Undertakings.—A special meeting of the City Council has been called for December 2nd to consider a proposal to acquire from the Urban District Councils of Waterloo-with-Seaforth and Great Crosby their respective

tramway undertakings, authorised by the Waterloo-with-Seaforth Tramways Order, 1898, and the Great Crosby Tramways Order, 1898. The Council will be asked to apply for the sanction of the Minister of Transport to the scheme.

London.—TRAMWAY IMPROVEMENTS.—The Highways Committee of the London County Council has recommended the construction of a tramway junction line at Catford and Bromley Roads to provide a direct service between Downham and Central London, *via* Catford, Forest Hill, and Dulwich, when the tramway extension to Downham is completed. The estimated cost of the scheme is £5,500.

New Zealand.—DUNEDIN.—The report of the manager of the city tramway undertaking (Mr. W. H. Mackenzie) for the year ended March 31st last shows a total revenue of £129,714, and working expenditure of £85,170, leaving a gross profit of £44,544. The figures for the preceding year were: Income, £126,407; working expenses, £85,906; gross profit, £40,501. After deducting capital charges, a net profit of £9,511 remained, as compared with £6,830 in the preceding year. The number of passengers carried increased from 19,482,997 to 19,729,985, and the car-miles run from 1,536,573 to 1,546,910.

Southern Railway Electrification.—The Southern Railway has issued a report stating that the suburban electrification scheme—from Charing Cross and Cannon Street to Orpington, *via* Chislehurst, Bromley North, Elmers End, and Addiscombe—scheduled for December 1st next, has had to be postponed for at least two months. This is due to the fact that the electricity supply contractors have informed the company that it is not possible for them to have the necessary supply ready by December 1st.

United States.—NEW ELECTRIC RAILWAY.—Surveys have been made by the Pacific Electric Railway for a line to be constructed between San Bernardino and Lake Arrowhead, Cal. If the line is built it will be under a joint arrangement between the Lake Arrowhead Company and the Pacific Electric Railway and operated by the latter company.—*Electric Traction.*

Telegraph and Telephone Notes.

Automatic Telephony.—LEEDS.—The change-over to automatic telephone services at the suburban district exchanges at Stanningley, Roundhay, Chapeltown, and Headingley took place on November 7th. This is an extension of the automatic system which has been in operation at the Leeds central exchange for some considerable time, and its extension to the suburbs gives Leeds the largest automatic telephone exchange in the country. The extension to these suburban stations adds upwards of 4,000 lines to the 7,000 already on the dial system. Curiously enough, Leeds, signally favoured in telephone service in this direction, is considerably later than most towns of West Yorkshire in adopting the street telephone kiosk, the first having only just been provided at Roundhay. The kiosks are provided by the Post Office on application by the local authorities. Morley, Rothwell, Crossgates, and Horsforth sub-exchanges are still on the old system, and their change-over is not at present contemplated.

Belgium.—TELEPHONE SERVICE.—According to a recent report, there are now 347 telephone exchanges in operation in Belgium, with a total of 105,026 subscribers. Brussels has six exchanges, three of which are automatically worked; the other three are being converted to automatic operation, and the work is expected to be completed by the end of the year.

CABLE DEVELOPMENT.—The first tenders for the supply of the new telephone and telegraph cables from Brussels to Herbesthal and from the French frontier to the Dutch frontier were submitted on November 4th. A Belgian company made the lowest quotation for the first contract, while for the second, third, and fourth contracts German firms offered the lowest terms.—*Reuter* (Brussels).

Colombia.—TELEPHONE SERVICE.—Evidence of the growing use of the telephone in the South American Republic of Colombia is afforded by the fact that no less than 90 small towns in the Department of Boyaca are now provided with exchanges.

Hull.—TELEPHONE TARIFF.—The Corporation Telephone Committee has instructed the manager to report on the question of reducing the telephone charges.

Telegraphists' Strike.—SETTLEMENT REACHED.—At a meeting of the Association of Wireless and Cable Telegraphists in London on November 4th, it was officially announced that a settlement had been reached in the dispute with Marconi's Co., and that the nine dismissed men and the operatives on strike would resume duty forthwith.

Radio Notes.

Anniversaries.—CANADA.—The Moncton, New Brunswick (CNRA) station celebrated its first anniversary by broadcasting a special programme to this country on the night of November 6th-7th. The wave-length was 291 metres and the power 750 watts. The station, one of the ten owned by the Canadian National Railways, is 3,300 miles from London.

LONDON.—November 14th being the third birthday of the British Broadcasting Co., Ltd., the event was celebrated this week.

Empire Broadcasting.—A NEW SCHEME.—Major Gladstone Murray, of the British Broadcasting Co., in a lecture at the Overseas Club, is reported by *The Times* to have said it was important that there should be an early adoption of some general scheme which would enable programmes to be exchanged regularly and re-broadcast across all parts of the British Empire. He regarded 5XX (Daventry) as the first link in a new Empire chain. Under existing conditions for British programmes to be re-broadcast in Canada, New Zealand, and Australia it was necessary for them to go through the United States, but in a real Empire chain they would be transmitted from 5XX to a listening post in the Maritime Provinces of Canada (say, in Newfoundland), whence they would be carried by land-line and wireless link to Winnipeg, and there be radiated by a central Canadian high-power station. These signals would be collected again by a British Pacific high-power station in British Columbia, which would reach New Zealand and Australia. Another high-power station in Australia would enable the messages to go forward to the Straits Settlements and thence be relayed from Rangoon to Colombo, in Ceylon, and India.

Irish Free State.—DUBLIN BROADCASTING STATION.—The first broadcasting station in the Irish Free State has been erected by Marconi's Wireless Telegraph Co., Ltd., in the McKee Barracks on the outskirts of Dublin. The studio will be in Denmark Street, off Henry Street. The transmitter, which will operate on a wave-length of 390 metres and will use the call sign 2 RN, is a 6-kW type Q set, the same type as the majority at the British main stations. It is expected that tests will begin shortly, and that the service will be inaugurated during December.

South Africa.—LICENCES.—Owing to the non-payment of licence fees, the three broadcasting stations in the Union are said to be in financial straits, and the Government is being pressed to introduce legislation to make the payment of fees compulsory.

Switzerland.—RADIO LABORATORY.—With the object of enabling manufacturers and importers of radio sets and components to offer their goods for sale in Switzerland with a Swiss certificate of merit, the Jean Noelting Wireless Testing Laboratory has recently been established at Meilen, Switzerland, under the patronage of the Swiss Radio Club.

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Australia. — MELBOURNE. — December 15th. Postmaster-General's Department. Junction apparatus for manual exchanges.*

December 29th. Magnet and resistance wire.*

SYDNEY.—February 1st. Municipal Council. Bunnerong power house equipment. Six 25,000-kW turbo-alternators, 18 100,000 lb. per hour boilers, &c., and 33,000-V switchgear. (See this issue.)

Barking.—January 1st. County of London Electric Supply Co., Ltd. Water-tube boilers with mechanical stokers or powdered fuel equipment, steam turbo-alternators, condensing plant, and auxiliary apparatus for the Barking power station. (October 30th.)

Belgium.—BRUSSELS.—November 25th. Belgian Post and Telegraph authorities. Telephone cables for Tamise, Malines, Willebroeck, and Gheel. Particulars (Cahier des Charges Special No. 3-158) for 6¼ fr.

Birkenshaw (Yorkshire).—November 17th. Installation of electric light in 22 houses in the District Council's housing estate at Old Lane. Mr. Ralph Brooks, Council Offices.

Bridlington.—December 7th. Electricity Department. One oil engine, direct coupled to a 275-kW d.c. generator, fuel storage tank, cooling tower, pipework, and pumps. (See this issue.)

Carlisle.—November 19th. Electricity Department. L.p. cast-iron piping for condensing water system. (October 30th.)

Dublin.—December 10th. Great Southern Railways Co. Stores for six months, including electric lamps, &c. Stores Superintendent, Inchicore, Dublin.

Dundee.—Town Council. Electric lighting installation at huts, King's Cross Hospital. Schedules from Mr. G. Baxter, city engineer.

November 20th. Electricity Department. Two-core and three-core l.p. cable. (See this issue.)

Egypt.—December 30th. Inspecting Engineer in London. Queen Anne's Chambers, S.W. Telegraph and telephone material and motor generator and telegraph apparatus.—*Reuter's Trade Service* (Cairo).

ALEXANDRIA.—December 10th. Ministry of the Interior. Machinery in connection with the waterworks scheme at Mellawi, consisting of electric motors and centrifugal pumps, control panels, l.p. armoured cable, &c. (C.X. 1,796.)*

India.—DELHI.—November 30th. Indian Stores Department. Sub-station equipment for Jaipur (comprising insulators, wire, l.p. cable, switchgear, transformer, &c.).*

Kingston-upon-Hull.—November 16th. Electricity Department. Two natural draught cooling towers. (October 30th.)

London.—LONDON COUNTY COUNCIL.—November 16th. Reconstruction of electrical switchgear at Shoreditch sub-station. (October 30th.)

METROPOLITAN ASYLUMS BOARD. December 2nd. Renewal of electric cables, &c., at the Brook (Fever) Hospital, Shooters Hill, Woolwich, S.E.

Madagascar.—January 1st, 1926. Administrateur-Maire, Diego-Suarez, Madagascar. Establishment of a central power station and electricity distribution system for public and private lighting and power purposes in the district. Particulars from the Agence Economique de Madagascar, 40, Rue de General Foy, Paris.

Manchester.—November 23rd. Tramways Committee. Iron and steelwork required at tramcar depôt, Birchfields Road, Fallowfield. Particulars from City Architect, Town Hall.

New Zealand.—WELLINGTON.—December 15th. Post Office Stores Department. Key switches.*

Public Works Department. January 19th, 1926. 50,000- and 110,000-V switchgear and steelwork for the Waikato electric power scheme. (B.X. 2157).*

GISBORNE.—Borough Council. Diesel engine, alternators, and auxiliary plant, rotary converter, and switchboard. (See this issue.)

Oldham.—November 21st. Electricity Department. Three 12,500-kW turbo-generators and auxiliary plant. (October 30th.)

December 5th. Eight water-tube boilers, with superheaters, chain-grate stokers, steel chimneys, and induced draught plant. (November 6th.)

Pentre (Glam.).—November 16th. Rhondda Urban District Council Electricity Department. Two 35-h.p. and one 20-h.p., 400-V, squirrel-cage induction motors. (November 6th.)

Peterborough.—November 30th. Electricity Department. Buildings and civil engineering work, pulverised fuel equipment, two boilers and boiler-house equipment, one 6,000-kW turbo-alternator and turbine-room equipment, e.h.p. and l.p. switchgear, &c. (See this issue.)

Southall.—November 24th. Southall-Norwood U.D.C. Overhauling and maintaining the fire-alarm system. (See this issue.)

South Africa.—JOHANNESBURG.—December 14th. Electricity Supply Commission. Plant and material for transmission lines and sub-stations in connection with the supply of electricity in the Cape area rural districts.*

December 23rd. Union Tender Board. Telephone apparatus and supply of telegraph material for the Department of Posts and Telegraphs.*

December 17th. Municipal Council. 2,000-kW motor converter. (B.X. 2,142.)*

CAPE TOWN.—December 3rd. Electricity Department. Three-phase induction voltage regulators.*

Sub-station plant and transmission lines. (B.X. 2,139.)*

FORT BEAUFORT.—December 10th. Municipal Council. Generating plant and materials for electric lighting.*

QUEENSTOWN.—January 7th, 1926. Municipal Council. Extensions to the electricity undertaking.*

Uruguay.—MONTEVIDEO.—January 18th. State Electricity Supply Works. 170,000 metres of r.i. cords.*

January 29th. Fuse wire, enamelled lamp shades, cut-outs, switches, lampholders, sockets, &c. (B.X. 2,126.)*

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Kirkcaldy.—Messrs. Yarrow & Co. (1922), Ltd., have secured a contract for Yarrow water-tube boilers, superheaters, and air heaters from Messrs. Michael Nairn & Co. (consulting engineers, Messrs. Kennedy & Donkin).

Hull.—Telephone Committee. Accepted:—
Insulators (£106).—W. F. Dennis & Co., Ltd.
Bell sets (£499).—Peel-Conner Telephone Works, Ltd.
Twin twisted wire (£156).—General Electric Co., Ltd.

Leeds.—Tramways Committee. Accepted:—
75 tramcar bodies (£1,390 each).—English Electric Co., Ltd.
75 tramcar bodies (£1,397 each).—Brush Electrical Engineering Co., Ltd.
190 pivotal trucks (£290 each).—Electro-Mechanical Brake Co., Ltd.

Electricity Committee. Accepted:—
Cables.—W. T. Henley's Telegraph Works Co., Ltd. (£5,362); Enfield Cable Works, Ltd. (£2,163); Macintosh Cable Co., Ltd. (£1,160).

London.—LONDON COUNTY COUNCIL.—
Six months' supply of portable accumulators.—Edison Swan Electric Co., Ltd.

H.M. Office of Works. Accepted:—
Switchboard for Royal Courts of Justice.—Park Royal Engineering Co., Ltd.

Maidstone.—Town Council. Accepted:—
Transformer (£187).—Johnson & Phillips, Ltd.
Air ducts for a new turbine (£60).—Jacksons, Ltd.

Notts.—County Education Committee. Accepted:—
Installation of non-automatic electric lighting set at Hopwell Hall (£429).—H. Barker, Ltd.

Sheffield.—Tramways Committee. Accepted:—
50 car bodies on trucks (£69,500); 50 trucks, complete (£10,700); 50 Maley's electro-pneumatic air-brake sets (£8,750).—Cravens, Ltd.
110 traction motors (£18,315).—Metropolitan-Vickers Electrical Co., Ltd.
100 tramcar controllers suitable for electro-pneumatic brakes (£8,745); 10 ditto, with standard fittings (£854).—British Thomson-Houston Co., Ltd.
50 rheostats (£550).—Electro-Mechanical Brake Co., Ltd.
100 automatic circuit breakers (£485).—Metropolitan-Vickers Electrical Co., Ltd.
50 trolley base boom and head sets (£973).—Brecknell, Munro & Rogers, Ltd.
50 sets e.l. fittings, switches, and fuses (£456).—General Electric Co., Ltd.
50 "Numa" air signal sets (£222).—Equipment & Engineering Co., Ltd.
50 traction-type lightning arresters (£137).—British Thomson-Houston Co., Ltd.

Winchester.—Education Committee. Accepted:—
Installing electric lighting at the Girls' County School.—Dicks, Ltd.

Forthcoming Events.

Faraday Society.—Monday, November 16th. At Burlington House, Piccadilly, W.1. At 8 p.m. Ordinary meeting.

Derby Society of Engineers.—Monday, November 16th. At Derby. Paper, "Notes on Starters for a.c. Motors," by Mr. O. C. Dinerman.

Institution of Civil Engineers.—Tuesday, November 17th. At the Institution, Great George Street, S.W. At 6 p.m. Paper on "The Mechanical Properties of Steel," by Mr. W. E. Dalby.

Paisley Association of Electrical Engineers.—Tuesday, November 17th. At Gibson's Tea Rooms, 16, High Street. At 7.30 p.m. Paper on "Individual Motor Driving," by Messrs. G. S. Young and C. E. Downer.

Association of Engineering and Shipbuilding Draughtsmen (Birmingham Area Technical Committee).—Wednesday, November 18th. At the Birmingham Chamber of Commerce. At 7.30 p.m Lecture on "The Design of Shafts for Bending and Torsion," by Mr. F. H. Boden.

Edinburgh Electrical Society.—Wednesday, November 18th. At the Royal Scottish Society of Art. At 8 p.m. Paper on "Stationary Batteries for Country House Lighting and Power Station Work Generally," by Mr. E. C. McKinnon.

Electrical Power Engineers' Association (West Yorkshire Section).—Thursday, November 19th. At the Cinema Exchange Theatre, Leeds. At 7 p.m. Lecture on "Modern Switchgear and Protective Devices," by Mr. W. A. A. Burgess.

British Electrical and Allied Manufacturers' Association.—Thursday, November 19th. At the Connaught Rooms. Annual dinner. 7 for 7.30 p.m.

Institution of Electrical Engineers.—Thursday, November 19th. At the Institution, Victoria Embankment, W.C. Lecture on "The Engineer: His Due and His Duty in Life," by Mr. T. Carter.

(Mersey and North Wales (Liverpool) Centre).—Monday, November 16th. At the University, Liverpool. At 7 p.m. Lecture on "The Engineer: His Due and His Duty in Life." by Mr. T. Carter.

(North-Western Centre).—Tuesday, November 17th. At the Engineers' Club, Manchester. At 7 p.m. Paper on "Dielectric Problems in High-voltage Cables," by Mr. P. Dunsheath.

(East Midland Sub-Centre).—Tuesday, November 17th. At Leicester. At 6.45 p.m. Paper on "Steam Pipes for Extra-high-pressure and Temperature," by Mr. J. A. Aiton.

(Sheffield Sub-Centre).—Wednesday, November 18th. At the Royal Victoria Hotel, Sheffield. At 7.30 p.m. Paper on "The Application of Electro-Pneumatic Machinery to Colliery Surface Plants," by Mr. A. R. Cooper.

Institution of Mechanical Engineers.—Friday, November 20th. At the Institution, Storey's Gate, S.W. At 6 p.m. Paper on "Characteristics and Uses of Ground Gears," by Mr. H. F. L. Orcutt.

Diesel Engine Users' Association.—Friday, November 20th. At the Caxton Hall, Westminster, S.W. Discussion on "Heavy-Oil Engine Working Costs."

Junior Institution of Engineers.—Friday, November 20th. At 39, Victoria Street, S.W. At 7.30 p.m. Lecturette, "De-Hydration of Tar," by Mr. G. E. Wills.

Manchester Electro-Harmonic Society.—Friday, November 20th. At the Albion Hotel, Piccadilly, W. Concert.

E.D.A. Conferences.—Friday, November 20th. At Caxton Hall, S.W. Address on "Assisted Wiring Schemes," by Mr. J. Edgar.

Electrical Trades Commercial Travellers' Association.—Saturday, November 21st. At the Manchester Hotel, E.C. At 7.30 p.m. Whist drive and social.

Association of Mining Electrical Engineers (South Wales Branch).—Saturday, November 21st. At the South Wales Institute of Engineers, Park Place, Cardiff. At 6 p.m. Paper on "The Education and Training of Mining Electrical Engineers," by Mr. T. J. Nelson.

Notes.

Salaries of Disabled Men.—The following letter is to hand at the moment of going to press:—

"On Wednesday we celebrate the 7th anniversary of Armistice Day, and our thoughts will be with those men who fought and died in the service of their country. Many men fought also, who, though escaping with their lives, paid the price for their patriotism in the maiming of their bodies.

"A number of these disabled men, by dint of hard study and, in some cases, the expenditure of considerable money, have attempted to overcome their infirmities and fit themselves for responsible positions in the electrical engineering industry. Notwithstanding all this, many of them find themselves to-day engaged in a hand-to-hand fight with poverty owing to the meagre salaries being doled out to them by their employers. Cases are known to the writer, of men with good technical qualifications who are receiving salaries of between £2 2s. and £2 10s. per week while engaged on the staffs of large successful companies.

"May I appeal to all employers to give kinder consideration to the claims of disabled men in their employ, and so recompense them to a small extent for sacrifices they have made?

November 9th, 1925. ARCO."

Train Collision Report.—We have received a copy of the report of the official inquiry into the circumstances attending the collision between an electric locomotive and a passenger train, which occurred at the Baker Street extension station on the Metropolitan Railway on June 14th. The evidence given was contradictory and it was concluded that the locomotive must have passed a signal in the danger position.

Appointments Vacant.—Junior charge engineer, for the Gloucester Corporation electricity works; carpenter and electrical wireman, for the Hastings Corporation electricity department; electrical engineer, for the Aldershot Gas, Water and District Lighting Co.; assistant electrical engineer (Rs. 700 per mensem), for the Madras Electric Supply Corporation, Ltd.; lecturer in electrical engineering, for the Bradford Technical College; testing assistant (£200), for the Borough of Derby electricity department; assistant electrical engineer (temporary), for the Ealing Corporation electricity supply department; consumer's engineer (£300), for the West Gloucestershire Power Co., Ltd. (See our advertisement pages to-day.)

Local Societies.—The EDINBURGH ELECTRICAL SOCIETY recently paid a visit to the automatic telephone exchange which is being installed for Edinburgh and district, and on November 4th the visit was followed up by a lecture given by Mr. W. J. H. Piper in the Post Office classroom, where a model exchange had been erected for demonstration.

YORKSHIRE ASSOCIATION OF CIVIL ENGINEERS.—Speaking at the opening meeting of the session of the Association, at Sheffield, Colonel H. Rhodes, mining engineer, this year's president, dealt with the coal industry, and said, generally, it might be said that at 90 per cent. of the collieries in this country electricity had been adopted as the motive power for the bulk of the subsidiary operations, the chief use to which steam was applied direct being for driving the winding engines. The indirect advantages to be derived from the adoption of electric winding would bring it more and more to the front. One of the most expensive items in modern winding plants was ropes, and he believed it was becoming increasingly recognised that the even turning movement and steady acceleration and deceleration of electric winding plants added to the useful life of the ropes.

Fatality.—Grasping a portable electric lamp with one hand and placing the other on a steel girder, James Glover, of Nottingham, was killed recently at the Colwick Beet Sugar Factory.

Research in New Zealand.—According to the *Daily Mail's* Christchurch correspondent, the New Zealand Government has referred to Professor Sir Ernest Rutherford, who has recently been visiting that country, for his advice on the question of the relationship of science and industry there, with special reference to the report of the Special Committee set up to consider the needs of New Zealand manufacturers with regard to scientific industrial research.

Railway Fog Signals.—The Southern Railway Co. is introducing a new signalling system on its suburban lines. The signals will be provided with four lights, which will indicate various instructions to the drivers of trains; the important point about these lights is that they will be on a level with the driver's eyes and will be far more powerful than any used hitherto, so that they will be able to penetrate through fog to a much greater extent.

St. Dunstan's.—The tenth annual report of this institution reminds us that although the Great War is passing into history, the good work of helping those of the Services who lost their sight to help themselves is still being carried on. The list of successes in aiding these men to surmount their serious handicap is gradually growing, and St. Dunstan's men are now making headway in a number of fields of activity.

Reinforced Concrete Pipes.—In a lecturette delivered to the Junior Institution of Engineers, on October 23rd, Mr. H. S. Bower described the construction and laying of reinforced concrete pipes. He said that the method recently adopted in the laying of a pipe line for carrying water in Spain was to use for the principal reinforcement thin steel sheets formed into cylindrical sections and welded together at all joints, about four of these sections making one twelve-foot length of pipe. A wire reinforcement was wound on to the outside of the steel shell, and a spiral wire cage was made on a former and then removed to the inside of the pipe to form a key to keep the concrete in place. The internal lining of concrete, which consisted of a two to one mixture of cement and sand, was spun into position by mounting the pipe on rollers and rotating it at a peripheral speed of about 37 feet per second after the proper quantity of concrete had been poured in. The concrete thus obtained was extremely hard and much denser than cast concrete. To receive its exterior coat of three to one concrete the pipe was placed in a split mould. Bends and special pipes were plastered by hand.

Each pipe was provided with a socket at one end for jointing purposes, joints being made by a rough bonding from the inside with quick-setting cement and then caulking from the outside between the socket of one pipe and the spigot end of the next with lead pipe filled with hemp. An additional short collar of the same steel section as the pipe was then slipped over the joint, a mould put round, and the whole grouted in to form a homogeneous joint. The interior of the pipe was finished off smoothly by a man who moved along inside on a small flat trolley.

A Solid Smokeless Fuel Conference.—Under the joint auspices of the Chemical Engineering Group and the Yorkshire Section of the Society of Chemical Industry, and the Institutions of Chemical Engineers, Gas Engineers, and Mining Engineers (Midland), a conference on "Solid Smokeless Fuel" will be held at the Mappin Hall, Sheffield University, on November 20th, under the chairmanship of Sir Arthur Duckham, K.C.B. The conference will be a continuation of the joint meeting of the Chemical Engineering Group and the Institution of Chemical Engineers, which was held in the University, Leeds, in July last. The Department of Fuel Technology of the University has arranged exhibits of the results of its research work. Tickets for admission to the meetings may also be obtained from the hon. secretary, Chemical Engineering Group.

Street Flood Lighting Experiment.—Flood lighting is to be used for illuminating Fitzalan Square, Sheffield. A 750-c.p. lamp has been fixed at each of the four corners and fitted with lenses and mirrors to enable the beam to be directed towards any desired place.

The North Wales Dam Accident.—The accompanying illustrations show respectively the wash-out beneath the concrete dam at Llyn Eigiau, which was the initial cause of the

Fig. 1.—The Wash-out beneath the Eigiau Dam.

trouble, and the breach in the dam at Coedty Reservoir, which resulted from the overflow consequent upon the former. For

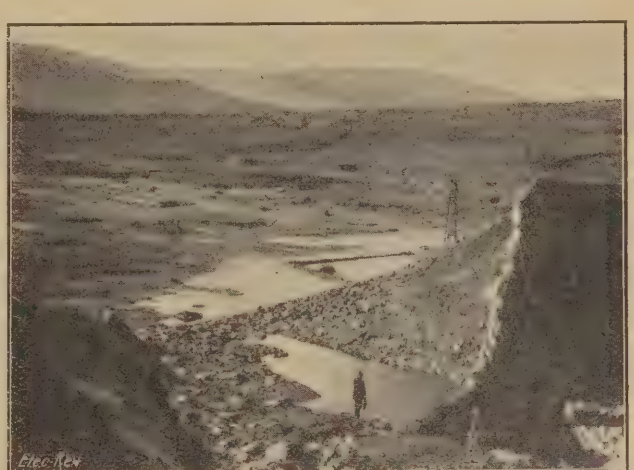

Fig. 2.—View through the Breach at Coedty.

the photographs, taken by Mr. J. W. Griffith, M.Inst.C.E., we are indebted to Mr. Theodore Stevens, whose account of his investigations will be found on p. 772 of this issue.

Faraday House Old Students' Association.—ANNUAL DINNER.—On Friday last the annual dinner of the Association was held at the Piccadilly Hotel, London; the president, Mr. H. W. H. Richards, M.I.E.E., was in the chair, and amongst the 180 present were many distinguished guests, including Mr. R. A. Chattock, Sir John Snell, Sir R. A. Hadfield, Dr. S. Z. de Ferranti, Sir James Devonshire, Sir Benjamin Longbottom, Mr. W. W. Lackie, Mr. S. L. Pearce, Col. Purves, Mr. C. P. Sparks, Sir Charles Morgan, and Mr. W. O. Smith.

After the loyal toasts, Mr. R. A. Chattock, president I.E.E., proposed "Faraday House and its Old Students," remarking that the number of students had doubled in ten years, and that the testing department was of great value to the industry. The high positions attained by the old students should encourage those now attending—he had found the old Faradians good men. Doctor Russell, their beloved principal, added to great scientific abilities a geniality and helpfulness which instilled into his students the desire to be of service to others, which was so necessary but so often wanting nowadays. Dr. Alex. Russell, F.R.S., responding, referred to the many distinctions gained by old Faradians during the past year, including 143 appointments, to the completion of the new laboratories, and to the increase in the teaching staff.

Mr. G. W. Partridge, M.I.E.E., proposed "The Guests," pointing out that amongst the many eminent engineers present were seven past-presidents of the I.E.E., and three of the Electricity Commissioners. Sir John Snell, G.B.E., responded, remarking that no other educationalist had so much personal influence over his students as Dr. Russell. He confidently anticipated a great extension of railway electrifica

tion both at home and in the Dominions, and of hydro-electric development, which he hoped to see in British hands. Dr. S. Z. de Ferranti also responded to the toast, referring to the great help he had received in the early difficult days from the most capable men. Great electrical developments were in prospect, calling for the services of many qualified electrical engineers, and Faraday House was doing splendid work in providing just the right sort of men, in quite the best way, thanks to the influence of Dr. Russell. Sir Charles Morgan, C.B.E., proposed the health of the chairman, whose success, he said, was due to character and personality, backed by hard work, and Mr. Richards briefly replied, expressing his indebtedness to Dr. Russell.

An excellent entertainment was provided, and the proceedings closed with "Auld Lang Syne."

Cable Ship in Distress.—A S.O.S. message was received at Valentia on November 6th, says *The Times*, from the cable-ship *Lord Kelvin*, stating that she had met with heavy weather in Lat. 49.40 N., Long. 29.43 W., and that part of her superstructure had been carried away, but that she was out of immediate danger and still under control. According to a later message, she was running before a heavy gale from the south-west in a seaworthy condition. The *Lord Kelvin* is a vessel of 2,641 tons, built in 1916 by Swan, Hunter and Wigham Richardson, Ltd., and owned by the Anglo-American Telegraph Co. She was last reported at Halifax in the middle of September.

Institution Notes.

Institution of Electrical Engineers.—Programmes.—The arrangements for the new session include the following provincial items:—

Scottish Centre.

December 2nd.—Annual dinner.
December 8th.—Major E. I. David. "Electricity in Mines."
January 12th, 1926.—Mr. H. M. Sayers. "Electricity Supply Tariffs."

South-Midland Centre.

November 27th.—Annual dinner.
December 2nd.—Prof. S. P. Smith. "An All-Electric House."
January 13th, 1926.—Mr. C. E. Webb. "The Power Losses in Magnetic Sheet Material at High Flux Densities."

Western Centre.

November 30th.—Mr. J. H. Thomas. Lecture on "Switchgear Developments during the Past 20 Years."
January 11th, 1926.—Address by the President, Mr. R. A. Chattock, and annual dinner.

Dundee Sub-Centre.

December 10th.—Mr. J. K. Murray. "Some Features of Telegraph Engineering."
January 14th, 1926.—Mr. W. M. Mackay. "Atmospheric Electricity."

East-Midland Sub-Centre.

November 17th.—Mr. J. A. Aiton, C.B.E. "Steam Pipes for Extra-High-Pressure and Temperature."
December 8th.—Mr. F. J. Moffett, B.A. (chairman of South-Midland Centre). Address.
January 19th, 1926.—Mr. A. B. Mallinson. "Justifiable Small Power Plant."

Hon. Member.—In opening the meeting of the Institution on November 5th, the president announced that the Council had that day elected Dr. S. Z. de Ferranti an honorary member of the Institution. A past president, Dr. Ferranti has been a full member since 1891.

Western Centre.—At a meeting of the Western Centre of the Institution at Bristol on November 2nd, under the chairmanship of Mr. J. W. Burr, Mr. J. W. Beauchamp (director of the British Electrical Development Association) lectured on "Domestic Electrification." He thought the Institution should have at least one meeting each year dealing with electricity in the home. He asked for the assistance of women to introduce it into their homes. They were the greatest buyers in the world.

By means of lantern slides, Mr. Beauchamp demonstrated suitable methods of lighting drawing-rooms and bedrooms, and stressed the importance of having a light behind the head when reading or writing. England was a mass producer of electric cooking stoves. Electricity also played a big part in feeding the train-travelling public, and in the kitchens of most of the large London restaurants it was in use. One of the latest uses to which electricity had been put was baking bread. It had been found that one ounce of dough less was required in a loaf cooked by electricity, and 10 per cent. was saved by cooking meat electrically.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.)

Mr. A. G. Ellis, the Chairman of the North-Western Centre of the Institution of Electrical Engineers, whose portrait appears herewith, was a student under the late Prof. S. P. Thompson at the City and Guilds Technical College, Finsbury, from 1899 to 1901. Later he was at the Central Technical College under the late Prof. W. E. Ayrton and Prof. T. Mather. In 1903 he joined the Fuller-Wenstrom Electric Manufacturing Co., and in the following year went to the Northampton Institute as assistant to Dr. C. V. Drysdale. In 1905 Mr. Ellis became assistant to Mr. H. M. Hobart, eventually becoming his chief assistant. He went to Switzerland in 1909, joining the Société d'Electricité, Alioth, Basle, as designing engineer for a.c. generators, transformers, relays, &c., and after the amalgamation, in 1911, of the company with Messrs. Brown, Boveri & Co., he was placed in charge

J. Ingham & Sons [*Bowdon, Cheshire*

Mr. A. G. Ellis,
Chairman of the N.W. Centre, I.E.E.

of the transformer department at the Alioth works. From 1913 to 1916 he acted as vice-chief of the transformer department of Messrs. Brown, Boveri's Baden works. He left Switzerland in 1916 to join the Metropolitan-Vickers Electrical Co., as chief engineer of the company's transformer department, and he still occupies that position.

While he has been with the Metropolitan-Vickers concern he has been responsible for the design and construction of the largest and highest-voltage transformers yet built in this country, including the 19,500-kVA, 33,000-V, 3-phase units for Barton, Manchester, and the 25,000-kVA, 132,000-V outdoor 3-phase groups for the Victoria Falls Power Co. Mr. Ellis's principal work of late years has been an endeavour to establish the British competitive position in the world's markets in large transformers, especially for outdoor sub-station work. He is also interested in standardisation, being a member of the Transformer and Insulating Oils Committee of the B.E.S.A., and the chairman of the Transformer Technical Committee of the B.E.A.M.A. In his earlier days Mr. Ellis was successively hon. secretary and chairman of the London Students' Section, and from 1920 to 1923 was hon. secretary of the North-Western Centre, on whose committee he has been since 1918.

Mr. Ellis has written three technical books—"Alternating Current Dynamo Design," "Armature Construction," and (with Mr. Hobart) "High-speed Dynamo-Electric Machinery." Two papers by him have been published in the I.E.E. *Journal*—one on "Steam Turbine Dynamos" and the other (with Mr. Thompson) on "Large Power Transformers." Mr. Ellis is a member of the Society of Technical Engineers, the Decimal Association, and Engineers' Clubs of London and Manchester.

Mr. Wilfrid S. Taylor has resigned his position as managing director of the Liverpool Electric Cable Co., Ltd., and has severed his connection with it. Mr. Taylor was one of the founders of the business, along with his father, 24 years ago, and during the last 14 or 15 years he has been mainly responsible for the company's progress and advancement. Mr. Taylor is leaving at the end of the week for a holiday in the South of England, but we are asked to say that any communications may be sent to him at his private address, 9, Caithness Drive, Wallasey.

Senor Gustavo Lira, manager of the Electrical Department of the Chilean Ministry of Public Works, has been appointed Minister of Public Works.

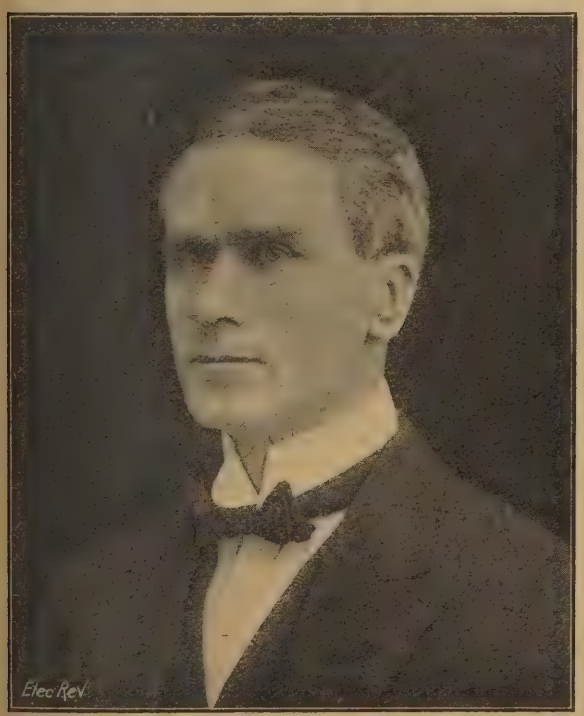
Messrs. Henry Lea & Son, of Birmingham, have been appointed consulting engineers for the new Naval School, which the Admiralty is about to build near Ipswich.

Col. O. C. Armstrong, chairman of Messrs. Greenwood and Batley, Ltd., has been appointed a member of the Credit Insurance Committee by the Parliamentary Secretary to the Department of Overseas Trade.

We regret to learn that Capt. R. J. Wallis-Jones, M.I.E.E., who is so deservedly popular in electrical circles, has been seriously ill; his many friends will join with us in wishing him speedy recovery.

Mr. E. J. Walsh, A.M.I.E.E., who prior to opening business on his own account, was engineer and manager of the Musselburgh E.L. & Tramway Co., has been elected a member (Moderate) of the Musselburgh Town Council.

At Day's Café, Dewsbury, recently, a gathering took place of members of the staff of the Yorkshire Electric Power Company, to make presentations of a canteen of cutlery to Mr. J. S. Pickles, and a set of oxidised silver vases to Mr. Arnold Pickles, and their wives. Both gentlemen are members of the mains construction staff, and have been recently married.



The Beckenham Urban Council is increasing the salary of the electrical engineer from £600 basic salary, plus £189 bonus, to £800, rising by annual increments of £25 to £1,000.

Messrs. Walker Vehicles, Ltd., have appointed Mr. Raymond E. Mitchell, M.I.E.E., M.I.Mech.E., M.I.A.E., to the position of development engineer at the headquarters at Clare House, Kingsway, W.C.2.

Professor F. W. Burstall, M.Sc., M.A. (Cantab.), M.I.Mech.E., head of the Mechanical Engineering Department of the University of Birmingham, and sometime Dean of the Faculty of Science, has been appointed Vice-Principal of the University, in succession to Sir William Ashley.

Mr. H. M. Sayers, M.I.E.E., informs us that his telephone number is "Streatham 5577."

The accompanying portrait is of Alderman Duncan Watson, the first chairman of the new Joint Electricity Authority for the London and Home Counties Electricity District, a report of the inaugural meeting of which appears in this issue, page 793. Mr. Watson is proprietor of Messrs. Duncan Watson and Co., electrical engineers. He graduated in Glasgow, and many of his friends in Scotland will not be surprised to learn that he has gained the confidence of his colleagues in London to the extent of placing him at the head of the biggest electrical authority in the country. Alderman Watson has a record of service which may be envied by many public spirited men. He was elected borough councillor at St. Marylebone in 1909, in which capacity he remained till 1915, when he was honoured with his aldermanship. He was Mayor of the Borough for the year 1919-20. He has been a member of the Electricity Committee since 1912, and was chairman during the years 1914-1917, and vice-chairman from 1921 to 1923. The Alderman has also served and is still serving on several other Committees of the Council. He was appointed a Justice of the

Vana] **Ald Duncan Watson,** [London.
Chairman of the London Electricity Authority.

Peace in 1923. In 1918 he was given the chairmanship of the Conference of Local Authorities Owning Electricity Undertakings in Greater London, and this position he has held until now.

Mr. F. Morley Ward, M.I.E.E., whose photograph accompanies these notes, and who was appointed general manager of the Relay Automatic Telephone Co., Ltd., in 1920, has severed his long connection with the Relay system, and proposes taking a rest before engaging in future activities. Mr. Ward (with Col. C. B. Clay, who resigned early last year) was engaged by the Marconi Co. to develop world-wide patents for the Betulander automatic (electro-mechanical) telephone system, and in 1913 demonstrated the apparatus in Paris on the occasion of the visit of the Institution of Electrical Engineers to the Société des Ingénieurs Electriciens, afterwards taking another demonstration plant to Italy. Later Mr. Ward spent several months in Sweden in investigating developments, which eventually led to Betulander's invention of the Relay system. This new system was only brought to England a few months before the war. We understand that Mr. Ward, as chief engineer of the company, was

Elliott & Fry] [*London.*
Mr. F. Morley Ward, M.I.E.E.

responsible for developing and improving the Relay system to meet British requirements, and in this connection took out numerous patents.

Obituary.—Mr. G. Duthie Smith.—We regret to record the death of Mr. Geo. Duthie Smith, chief assistant with the Chiswick Electricity Supply Co., Ltd. Mr. Smith was a son of the late Mr. Alex. Smith, gas engineer, Aberdeen. He served his apprenticeship with Messrs. McKinnon & Co., Ltd., engineers, Spring Gardens, and spent several years in Glasgow, Halifax, and New Southgate, London, before entering the service of the Chiswick Electricity Supply Co., Ltd., where he had been for the past 20 years.

Will.—Mr. R. Grant, of Prestwich, branch manager of Messrs. Stewart & Lloyds, Ltd., left £16,168 net and £17,784 gross personalty.

New Companies Registered.

Fluor Light, Ltd. (209,430).—Private company. Registered November 4th. Capital, £1,000 in 10s. shares. Objects:—To adopt an agreement with H. A. Wolfe and G. A. Williamson to develop and turn to account the several inventions described in certain agreements entered into by them and referred to in the above agreement, and to carry on business as manufacturers of luminous electrical signs, devices, ornamental and decorative work, electrical, mechanical, and other advertising signs, material for electrical and other illumination work, electrical transformers, &c. The first directors are:—J. I. McCaa, "Sarnia," East Sheen, Surrey, medical practitioner; H. A. Wolfe, 33, Basnett Road, W.10, inventor; J. H. Mendoza, 22, Bellingham Road, S.E.6, legal agents' manager; G. A. Williamson, 12, Holmesdale Avenue, East Sheen, legal agents' manager. The last two named are joint managing directors. Qualification, 1 share. Remuneration of the above £100 per annum. Secretary: G. W. Williamson. Registered office: Thanet House, 231-232, Strand, W.C.2.

Crosby (Liverpool), Ltd. (209,492).—Private company. Registered November 5th. Capital, £500 in £1 shares. Objects:—To carry on the business of electric light and general electrical engineers, manufacturers of, and dealers in electric light and other electrical apparatus, &c. The first directors are:—H. E. Fillingham, "The Homestead," Hightown, Liverpool, electrical factor (permanent); J. Bennett, 76, Chester Road, Chester, traveller; E. W. Jones, 3, Fairholme Road, Crosby, traveller. Qualification, 25 ordinary shares. Remuneration as fixed by the company. Solicitors: W. & J. Cooper, Preston. Registered office: 63, Tithebarn Street, Liverpool.

W. Mackie & Co., Ltd. (209,490).—Private company. Registered November 5th. Capital, £12,000 in £1 shares. Objects:—To acquire the business of electrical and mechanical engineers lately carried on by the late M. W. W. Mackie, and to carry on this and the business of wireless engineers, &c. The first directors are:—E. Mackie (chairman), "Willowmay," Hythe End, Wraysbury, Bucks.; J. Rook (managing director), 45, Broomfield Avenue, Palmer's Green, N.13; G. A. Butt, 20, Vincent Road, West Green, N.15, accountant. Qualification, 1,000 shares. Solicitor: E. Mackie, 51, The Mall, Ealing. Registered office: Palace Engineering Works, 129-133, Lambeth Road, S.E.1.

Western Electric Co., Ltd. (209,405).—Private company. Registered November 2nd. Capital, £100 in £1 shares. Objects:—To carry on business connected with the purchase and sale of telephones, telephonic, telegraphic, and electric lighting apparatus, instruments, and machinery, electric cables and wires, and electrical goods of all kinds, &c. The first directors are:—H. A. P. Disney, "Uphanger," Chorley Wood, Herts., secretary; G. D. Colclough, 73, Burton Court, Sloane Square, S.W.1, solicitor. Solicitors: Johnson, Jecks & Colclough, 24, Austin Friars, E.C.2.

Official Returns of Electrical Companies.

East Anglian Electric Supply Co., Ltd.—Particulars filed of £20,000 debentures authorised by resolutions of June 10th and October 9th, and covered by trust deed dated October 23rd, 1925, constituting a specific charge on certain freehold properties at Stowmarket, Felixstowe, Sudbury, Framlingham, and Needham Market, with appurtenances thereto, and buildings, plant, and machinery, and a floating charge on the remainder of the undertaking and assets, including uncalled capital, the whole amount being now issued. Trustees: Lt.-Col. H. W. Woodall, C.I.E., M.I.C.E., and Mrs. E. N. Woodall, Stinsford House, Dorchester; and C. W. Woodall, 34, Great Tower Street, E.C.2.

Telephone Co. of Pernambuco, Ltd.—Particulars filed of £150,000 8 per cent. registered debentures authorised October 20th, 1925, and covered by trust deed of the same date, charged on the company's undertaking and property, present and future, including uncalled capital, and all existing and future concessions and contracts relating to the provision and operation of telephone services. None issued. Trustees: Witan Investment Co., Ltd., 28, Austin Friars, E.C.

Willesden Electric, Ltd.—W. R. Clemens, of Alderman's Walk, Bishopsgate, E.C.2, ceased to act as receiver on June 5th, 1925. (Notice filed on October 30th.)

A. Lippold, Ltd.—G. J. Davey, of 267, Mitcham Lane, Streatham, S.W.16, ceased to act as receiver or manager on October 28th, 1925.

Direct West India Cable Co., Ltd. (53,956).—Capital, £120,000 in £5 shares. Return dated October 8th, 1925. 120,000 shares taken up. £60,000 paid. Mortgages and charges: Nil.

W. R. Sykes Interlocking Signal Co., Ltd. (93,078).—Capital, £50,000 in 87,500 "A" and 12,500 "B" shares of 10s. each. Return dated October 28th, 1925. 42,297 "A" and 12,500 "B" shares taken up. £10,513 12s. 6d. paid, being 5s. per share on 42,297 "A" shares, less £60 12s. 6d. calls unpaid. £16,824 5s. considered as paid, being 10s. per share on 12,500 "B" and 5s. per share on 42,297 "A" shares. Mortgages and charges: £17,526.

Marconi's Wireless Telegraph Co., Ltd. (53,403).—Capital, £4,000,000 in 3,750,000 ordinary and 250,000 7 per cent. cumulative participating preference shares of £1 each. Return dated August 14th, 1925. 3,249,913 ordinary and 250,000 preference shares taken up. £3,383,888 paid on 3,133,888 ordinary and 250,000 preference shares. £116,025 considered as paid on 116,025 ordinary shares. Mortgages and charges: £1,373,906 12s. 4d.

Coniston and District Electric Supply Co., Ltd. (138 478).—Capital, £2,000 in 1,500 6 per cent. preference and 500 ordinary shares of £1 each. Return dated October 10th, 1925. 1,440 preference and 500 ordinary shares taken up. £1,660 paid on 1,440 preference and 220 ordinary shares. £280 considered as paid on 280 preference shares. Mortgages and charges: Nil.

B.N.B. Wireless, Ltd.—Satisfaction in full on September 10th, 1925, of debentures dated November 22nd, 1925, securing £100.

City Notes.

Reports and Meetings of Electrical Companies; Dividend Results, &c.

Southern Brazil Electric Co., Ltd.

The annual meeting was held on November 4th, Mr. E. H. Tootal (chairman) presiding. In presenting the report and accounts, which were abstracted in our last issue (p. 749), the chairman said that the loss had risen from £18,900 in the previous year to £20,860 in the year under review. The directors, having reduced the arrears of income tax by £17,500, hoped that by the end of next year that indebtedness would have been entirely cleared off. The drought of which he spoke at the last meeting had continued well into September last, and had had a serious effect upon the company's business. The supply of current for industrial purposes had to be cut down to two days per week, the tramways ran reduced services, and private consumers were restricted to 60 per cent. of their normal requirements. Towards the end of September rains were experienced which enabled the supply to be slightly increased. During the drought period the supply had been maintained, and the Companhia Campineira was even able to supply excess current to other parties. Steps were being taken to raise the level of the Jaguary dam to ensure an increased volume of water for the future. During the past year the exchange at one time fell to below 5d., but it had improved to 7½d. gradually and remained steady. A great deal of building activity was going on in the city of Sao Paulo, which should lead to increased demands for electricity. The demand from the coffee planters was steadily growing.

Aluminium Corporation, Ltd.

The annual meeting was held under the chairmanship of Mr. K. M. Clark on November 4th. Prior to presenting the report for the past year, the chairman made reference to the calamity which had occurred a day or two before. He stated that a big breach had been made in the long leg of the Eigiau dam, and the low-level dam had given way. A temporary supply was being given from Cwm Dyli, and it was expected to have a machine at work on that day (November 4th). The Cowlyd dam and the 3-ft. pipe were in good order. It was expected that a full supply of power from the company's own machines would be resumed in a week; in the meantime connections had been made to other steam stations in the eastern area. The chairman said that this was the second unfortunate set-back within the space of a year. In November last year a new and large pipe line gave out, rendering the entire installation useless. Prompt action had been taken, however, and a supply to the various towns was maintained without interruptions. It had been necessary practically to rebuild the pipe line, and it was only during the last month that it had been returned to active operation. Following the loss of the stored water, the past summer had been a dry one. In the circumstances the shareholders could not be surprised that the directors were unable to pay a dividend on the preference shares. Sales of metal during the past year had increased by about one-third, and the sale of energy by about 24 per cent. Prices were satisfactory and the demand for their products was in excess of their ability to supply. Before the latest calamity they had more furnaces at work than ever before in the company's history, and the recent rain had made their water position satisfactory. He thought that the company was about to secure the benefit of the very heavy constructional work which it had carried out. The report and accounts were adopted, and an expression of sympathy with the bereaved relatives of those killed in the bursting of the dam was made.

A. J. Stevens and Co. (1914), Ltd.

Speaking at the annual meeting on November 4th, the chairman (Mr. E. E. Lamb) said that the net result for the past year had been a profit of £42,116, to which was added £26,092 brought forward, making a total of £68,209. A dividend of 12½ per cent. was being paid on the ordinary shares for the sixth successive year. Referring to the Wireless Department, Mr. Lamb said that the re-built factory had been equipped with the latest machinery and plant for the economical production of apparatus, and the number of employés had been nearly doubled. The business had so increased that further accommodation was becoming a matter of urgency. The company had opened a large radio showroom in London.

German Companies.

The *Hanover Power Works Company*, which is owned by the State of Prussia, states that the output increased from 2.52 million kWh in 1923-24 to 41.41 millions in 1924-25. The accounts show a net profit of 210,000 marks, which has been carried forward.

The *Rheydt Çable Works Company* states that the works were well occupied in 1924. After writing off 558,000 marks for depreciation, the accounts show net profits of 1,058,000 marks, permitting of the payment of a dividend at the rate of 15 per cent.

The *Energy Industry Company*, of Berlin, which is associated with the Rhenish-Westphalian Electricity Works Company, has closed the year 1924-25 with a slight loss. The directors state that the general credit crisis practically stopped the construction of electricity works and extensions. On the other hand, more favourable results were obtained from the management of electricity supply and tramway undertakings.

French Companies.

The *Société de Constructions Electriques de Nancy* reports a profit of 326,000 fr. for 1924-25; this has been applied to depreciation and reserve funds, while 112,000 fr. has been carried forward.

The *Société d'Electro-Métallurgie de Dives* reports that the complementary installations for rolling and for the manufacture of tubes were finished and placed in operation in 1924-25. With the balance brought forward, the net profits amount to 12,047,000 fr., permitting of the payment of a dividend at the rate of 80 fr. per share.

Swiss Companies.

The *Electro Values Company*, of Basle, proposes to pay a dividend at the rate of 7 per cent. for 1924-25 on share capital of 20,000,000 fr., as compared with 4½ per cent. in the previous year.

The *Motor-Columbus Company for Electrical Undertakings*, of Baden, proposes to pay a dividend at the rate of 9 per cent. for 1924, out of net profits of 5,860,000 fr., as in the preceding year.

The *Watt Electrical Undertakings Company*, of Glarus, reports that the deficiency of 2.89 millions of francs brought forward has been reduced to 2.87 millions in 1924-25, and the directors propose a scheme of reorganisation under which the share capital will be reduced from 10,000,000 to 3,500,000 fr.

Stock Exchange Notices.—Dealings in the following have been specially allowed by the Committee under Rule 159:—

Consolidated Gas, Electric Light and Power of Baltimore.—140,257 shares of no par value, issued at $35, partly and fully paid, and fractional warrants.

Dubilier Condenser (1925).—15,000 ordinary shares of 10s. each, fully paid, Nos. 400,001 to 415,000.

Pettigrew and Merriman (1925).—435,600 ordinary shares of 5s. each, fully paid, Nos. 125,001 to 560,600.

Shawinigan Water and Power.—12,798 new shares of $100 each, fully paid.

The undermentioned securities have been ordered to be officially quoted:—

Callender's Cable and Construction Co., Ltd.—100,000 ordinary shares of £1 each, fully paid, Nos. 500,001 to 600,000.

Shropshire, Worcestershire and Staffordshire Electric Power Co.—32,625 six per cent. cumulative preference shares of £1 each, fully paid, Nos. 1,127,376 to 1,160,000.

Prospectuses.—*Melbourne and Metropolitan Tramways Board.*—An issue of £300,000 5 per cent. stock, 1944, has been offered at £96 per cent. The proceeds will be used for the conversion of cable trams to electric, and in connection with the general scheme for the development of the Melbourne tramway system.

British Monomarks, Ltd.—This company, whose scheme was outlined in our issue of July 17th (p. 92), has now been formed and has issued a prospectus offering 150,000 ordinary shares of £1 each at par. The nominal capital consists of £20,000 in founders' shares and £230,000 in ordinary shares. The directors include Col. O. C. Armstrong, D.S.O. (Greenwood and Batley, Ltd.) and Lord Meston (English Electric Co., Ltd., and Calcutta Electric Supply Corporation, Ltd.).

Norwich Electric Tramways Co.—The report for the year ended June 30th last shows that the net profit increased by £4,304 to £20,916, the receipts having risen and the expenses decreased. The sum of £1,248 from the previous year was added to the net profit, making £22,165. It was proposed to transfer £10,000 to reserve, to pay a dividend of 4 per cent., and to carry forward £1,605. The number of car-miles run increased from 1,017,575 to 1,078,592, and the number of passengers carried from 12,386,659 to 13,529,680. The company inaugurated a motor-omnibus service in April last, and it is proposed to substitute 'buses for the trams on other routes where the returns are of a low order.

Kaministiquia Power Co.—An offer was made in Montreal last week of first mortgage, 25-year, 5½ per cent. sinking fund gold bonds, series "A," to the extent of $2,000,000. The *Financial Times* states that an amount of £205,000 5½ per cent. first mortgage debenture stock, series "A," ranking *pari passu* with the above bonds, will be placed in London shortly. The transfer of the undertaking to the new company is stated to be completed, and the proceeds are being distributed in the form of cash and preferred stock to the holders of the old company's common shares. No distribution is being made on the common shares in respect of the quarter just ended.

Amazon Telegraph Co., Ltd.—The report for the year ended June 30th last states that the gross revenue amounted to £52,980 and the working expenses to £27,256. After providing for taxation and debenture interest and transferring £15,305 to the sinking fund and £2,000 to general reserve, there remains a balance of £372, to which is added £3,066 brought forward, making £3,438. The directors propose to carry this balance forward. The report mentions the death of Mr. Ellice-Clark, who had been a director since 1901. The meeting is to be held on November 17th.

Agar, Cross & Co., Ltd.—The available balance at the close of the past financial year (including £39,441 brought forward) was £351,391. The allocations include £120,000 to general reserve, £10,000 to income tax reserve, and a final dividend and bonus on the ordinary shares, making 16 per cent. for the year, free of tax. It is proposed to capitalise £225,000 of the reserve and distribute it in £1 shares to the ordinary shareholders in the proportion of one new share to each two held.

Radio Corporation of America.—For the second quarter in succession the returns for the three months ended September 30th showed a deficit of $358,275, although for the first nine months of the year there was a surplus of $1,179,001. The adverse result is stated to be due to the drastic price-cutting resorted to by competitors.

Guest, Keen & Nettlefolds, Ltd.—Interim dividends at the rate of 5 per cent. per annum on the first and second preference shares, and of 1s. per ordinary share, all free of tax, have been declared in respect of the six months to September 30th last. These dividends are similar to those paid last year.

Electric Construction Co., Ltd.—The following interim dividends have been declared in respect of the year ending March 31st next:—Preference shares: At the rate of 7 per cent. per annum; ordinary shares: At the rate of 6 per cent. per annum.

German Loan in America.—Debentures of the Hamburg Electrical Works to the extent of $4,000,000 were offered in New York recently. The bonds, which mature in 1935, bear interest at the rate of 7½ per cent. and were offered at 95½.

Para Electric Railways and Lighting Co., Ltd.—The interest on the 5 per cent. first debenture stock in respect of the half year ending November 30th is being paid on December 1st.

National Telewriter Co.—The first distribution made by the company since its inception in 1909 is announced. This is a dividend of one per cent. on the 7 per cent. cumulative participating preferred ordinary shares.

Siemens Bros. & Co., Ltd.—An interim dividend of 2½ per cent., less tax, has been declared on the ordinary shares, as in 1924.

Cawnpore Electric Supply Corporation, Ltd.—An interim dividend of 3 per cent. has been declared on the ordinary shares, as in 1925.

Madras Electric Supply Corporation, Ltd.—The directors have declared an interim dividend of 2½ per cent., free of tax, as last year.

W. T. Henley's Telegraph Works Co., Ltd.—The directors have declared an interim dividend on the ordinary shares of one shilling per share, less tax.

Johnson & Phillips, Ltd.—An interim dividend of 7½ per cent. has been declared on the ordinary shares. The dividend for the whole of 1924 was 10 per cent.

Anderston Foundry Co., Ltd.—The directors state that they do not propose to pay an interim dividend.

Stocks and Shares.

Monday Evening.

Comment upon movements in prices, and upon the causes that produce them, occupy a second place of importance nowadays. The prices themselves are the centre of interest and of attraction. The remarkable rises that occur, every week, in shares of manufacturing companies are watched with the liveliest interest by people who know that the advances are due to the knowledge of the companies' profitable activities. Speculation has entered the field, thrusting its orders into the press of others that originate with investment pure and simple. Together, the two species of demand have led to the market developing what would be a condition of buoyant activity if there were a sufficiency of supply for all who desire to buy shares. But, as things are, stock is in short supply, and this forces a restriction upon business.

Johnson & Phillips at 59s. 3d. are 4s. 6d. up. Siemens have risen 3s. 6d. Enfield ordinary strengthened to 3¾. Automatic Telephones at 50s. are 2s. 6d. better. Prices seemed to be rampant at the end of last week. A slightly easier tone evidenced willingness to take profits a few days later. Prices held most of their ground, but a few people began to ask whether the boomlet had not already proceeded quite far enough. Therefore the quotations are not at the highest recently reached.

Edisons eased off to 9s. and General Electrics to 28s. 6d. English Electrics continue to be a good market, ordinary and preference both showing improvements. The engineering section retained most of its strength, though Babcocks reacted to 51s. 3d. Shares connected with the "heavy" trades of the country were bought in advance of what was anticipated would prove an optimistic speech from the Premier at the Guildhall banquet this, Monday, night.

Cable stocks and shares have thrown off all their previous dulness and prices have materially improved. Eastern ordinary stock rose 4; Eastern Extensions, Globe ordinary and Westerns are all 5s. to the good. Rumours of a possible increase in the Bank Rate hold no terrors for this department. Indo-Europeans are £2 up: Anglo-Americans show modest gains. Foreign telephones are equally good. United River Plates have put on 6s. 3d.: Chile and Cuba shares, while nominally unchanged, are not easy to buy. Marconis have become quiescent. Canadian Marconis are easier at 6s. 9d. Burndept Wireless maintain their strength, the preferred at 24s., the deferred at 5s. 9d. Anglo-Portuguese Telephones have gone up to 15s. and are still wanted.

Aluminium Corporation shares dropped to 30 upon news of the deplorable disaster in North Wales. The accident caused a melancholy death-roll, and considerable damage to the company's property. The Aluminium Corporation supplies the North Wales Power Company with energy, and the latter has been steadily increasing its demands. Lancashire Light and Power ordinary are 1s. up at 26s. 6d. Electric Supply Corporation hardened to 32s. 6d. Bournemouth and Poole ordinary have again reached 3.

London electricity prices are hard. St. James' and Pall Mall have risen to 15; County new preference to 2s. 3d. premium buyers. There are on offer 1,000 Westminsters at 44s. 6d., 500 Charing Cross at 50s. 6d., and 500 City "Lights" at 46s. 9d.

Southern Brazil Electric bonds have been so freely "tipped" for some time past that widespread disappointment is felt at the accounts for 1924, showing a deficiency after payment of the debenture interest. The report states that the outlook is now brighter, owing to the improvement in the exchange, &c. The price of the bonds is about 54. British Columbia Electric Railway stocks are irregular, a rise of 2 in the preferred being balanced by a decline of similar amount in the deferred. Anglo-Argentine first preference have hardened to 3 7/16. The Mexican group affords no feature of interest.

The Madras Electric Supply interim dividend of 2½ per cent., tax free, is at the same rate as that of last year and the price of the shares remains at 24s. 6d. The company's 5½ per cent. preferred shares stand at 20s. and the 7 per cent. second debentures at 101½. Cawnpore Electric's interim dividend of 3 per cent. is less tax, as before; the ordinary are quoted at 25s., the 7 per cent. preference at a guinea and the 5 per cent. tax-free debentures at 95s. 2d. Brazilian Tractions have regained the deducted dividend of a dollar, at 80.

Home Railway steam stocks are depressed by the opposition offered to wage-reductions, on the part of the N.U.R. The Undergrounds have not been affected: Metropolitan Consolidated is a point higher on the week, and the rest of the list is unchanged. The general volume of business throughout Stock Exchange markets shows appreciable diminution from the high tide it reached last month, and everyone who benefited from the rush is thankful for the breathing space that the bull provides.

Educational.—University of London, University College.—We have received a copy of the calendar for the current session, a volume of clxxviii+458 pages, which contains a vast amount of information regarding the College itself and the various Faculties, courses of study, scholarships, societies, &c., which are associated with it. Prof. E. G. Coker, F.R.S., is the Dean of the Faculty of Engineering, Prof. J. A. Fleming, F.R.S., Vice-Dean, and Mr. W. C. Clinton, B.Sc., Sub-Dean.

Transparent Steel.—A new method of making sheets of metal of unprecedented thinness, invented by Dr. Karl Müller, of the Physical Technical Institute of Berlin, seems likely to prove of considerable industrial as well as scientific importance. He has succeeded in producing sheets of steel so thin that they are as transparent as the clearest glass. The structure of the film is perfectly even and equal in all directions. The metal sheets are so thin that atoms will pass through them without impediment. Alpha rays from radium, which consist of streams of the stripped atoms of helium, and are completely blocked by a sheet of paper, are not perceptibly weakened in passing through such metal sheets. It is calculated from the specific gravity of the metal that these sheets are not more than thirty layers of atoms in thickness. Dr. Müller makes them by depositing an extremely fine film of the metal on a smooth surface by means of an electric current and afterwards separating the film from the foundation on which it was fixed. They seem likely to prove serviceable in metallurgical research, and in the making of galvanometers, radio receivers and apparatus for measuring the action of the heart.—*Science Supplement.*

United States Electrical Exports.

The following figures, showing the exports of electrical machinery and apparatus from the United States and the principal countries of destination in 1924, are taken from the recently-issued annual statistics of American trade. The comparative figures for 1923 have been added and notes of any increases or decreases given.

According to the official statistics the total values in thousands of dollars of the exports of electrical machinery and apparatus since 1910 have been as follows:—

Av. 1910-14	21,094	1921	88,931
Av. 1915-19	41,317	1922	53,147
		1923	59,927
1920	93,184	1924	69,828

Insulated wires and cables, although shown below, are not classed in the United States statistics as electrical goods.

	1923. $	1924. $	Inc. or dec. $
Generators, d.c., under 500 kW—			
Total	788,000	1,067,000	+ 279,000

A Patent Law for the Straits Settlements.—By a recent amendment to Sections 14 and 15 of the Straits Settlements Ordinance, it is now possible for British patentees to obtain protection in the Straits Settlements corresponding to their British patents. Messrs. Hughes & Young, Patent Agents, state that a patent can be registered in the Colony by applying within three years from the date of the issue of the British patent, the application, if the British patent is assigned, being made by the assignee. Normally, the patent expires with the expiration of the corresponding British patent, but applications for extension of the term of the patent can be lodged before the last three years of the full duration of the British patent. The Act provides against any action for infringement which occurred before the issue of the certificate or registration in the Colony, although the registration has a priority date corresponding to the date of the British patent. The Federated Malay States and Johore have introduced similar amendments in their Patent Laws.

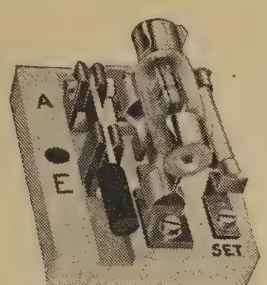
Selected Radio-Telephone Apparatus.

Recent Developments and Improvements.

An Aerial Protector.

Considering the number of broadcast radio-telephone receivers now in use, the instances which have been reported of such apparatus having been damaged by lightning striking the aerials are remarkably few. The extent to which an aerial may be affected by a lightning discharge and the results likely to arise therefrom are of practical importance, and the subject is now receiving more attention than hitherto.

For the benefit of those users of outdoor aerials who consider it desirable to provide some form of protection against the risk of fire or damage to the receiving apparatus which may arise in the above-mentioned way (remote though the risk is), MESSRS. SIEMENS BROS. & CO., LTD., have developed what would appear to be an efficient protector. This compact



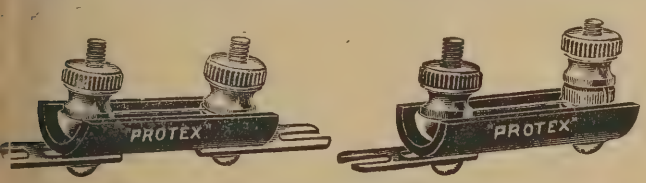


Fig. 1.—A Siemens Aerial Protector.

little device embodies the firm's well-known vacuum arrester, a fuse, and an earthing switch all mounted on a porcelain base, as shown in fig. 1. It has the advantage of ensuring protection at all times, whether the set is in use or not, and it is capable of functioning many times before renewal becomes necessary. Simpler types of both vacuum and carbon-block arresters, but without earthing switches, are available, and the company also supplies porcelain-base fuses for protecting l.p. and h.p. batteries in the event of a short circuit.

The "Protex" Fuse.

Another accumulator safety device is shown in figs. 2 and 3; it is a simple attachment, a product of Messrs. WARD & GOLDSTONE, LTD., capable of being fitted in a few seconds, and consists of suitable terminals to hold the fuse wire, mounted in a channel which protects the instrument panel in the case of the fuse blowing. A supply of fuse wire is provided with each "Protex," which may be used for protection against short

Figs. 2 & 3.—"Protex" Accumulator Fuses.

circuit or over-charging of the accumulator, or (with finer fuse wire) in circuit with the valves, or as an ordinary fuse, &c. The simplest method of attachment is to place the slotted end of the fuse under the battery terminal, the circuit being continued from the terminal at the opposite end of the "Protex"; for bridging two accumulator cells two slotted connector plates are provided, as shown above.

The "Goltone" Receptor.

In order to obviate the use of loading coils for tuning-in the Daventry station (1,600 m.) on "short-wave" crystal sets, the receptor shown in fig. 4 has been placed on the market by Messrs. WARD & GOLDSTONE, LTD. This device affords a simple method of adapting existing crystal sets, it being

Fig. 4.—"Goltone" Receptor.

a capacity device, complete in itself, and is connected across the aerial and earth terminals by means of the flexible cords shown in the illustration. On valve sets which do not employ high-frequency amplification, the "Goltone" receptor is said to permit the tuning-in of 5 XX.

A New Loud-speaker.

The design of the BRITISH THOMSON-HOUSTON CO.'S new type C2 loud-speaker has been given careful attention, as is indicated in figs. 5 and 6. The body containing the whole magnetic pole-piece assembly is embedded in Fabrolite, a synthetic moulded insulating compound having high insulating properties. This construction ensures rigidity and freedom from vibration, as the number of separate parts is reduced to a minimum. The diaphragm is clamped rigidly at its periphery by means of moulded threads on the body and base, which are both made of Fabrolite. The small end of the horn is held rigidly in position by means of a nut which co-operates with an internal thread moulded in the base. Permanent cobalt-steel magnets are used in the magnetic circuit, which is

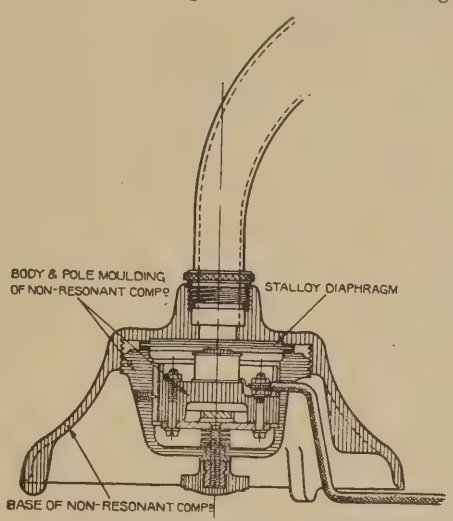

Fig. 5.—Section Through Base of B.T.-H. "C2" Loud-speaker.

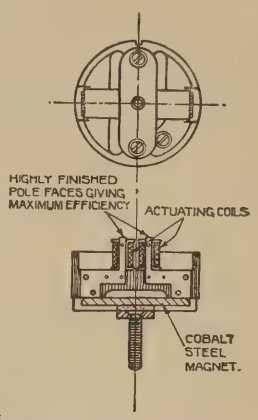

Fig. 6.—Plan and Elevation of "C2" B.T.-H. Loud-speaker.

short and direct so as to produce a field of high intensity, and a special construction is adopted to secure good contact between the pole pieces and the ends of the magnet. The magnetic field of each pole piece is measured on each unit to ensure that a certain intensity is produced, and the spools are very thin, so that the turns of wire, being very close to the magnet, exert the maximum effect. Each and every coil is tested to ensure uniformity, and the flexible lead is attached to terminals inside the magnetic unit. The moulded base and the flare of the horn are of the usual B.T.-H. chocolate brown, while the neck is polished aluminium, the appearance being enhanced by a decorative grille in the mouth of the horn.

The Hanging "Mellovox" Loud Speaker.

The hornless loud-speaker shows a tendency to become the most popular model of the season, and in order to meet further public requirements the hanging "Mellovox" has been introduced to meet the wishes of those who prefer a loud-speaker which can be hung in any part of a room. We are informed by the MARCONIPHONE CO., LTD., that the general constructional

Fig. 7.—Hanging "Mellovox" Loud-speaker.

details are identical to those of the ordinary type of "Mellovox," with the exception that the base has been removed and a ring attached to the adjustment screw as a means of suspension, see fig. 7. A lead, 16 ft. long, has been fitted in order that the loud-speaker may be placed in any position of advantage within reasonable distance of the set. Regarding performance, a full rich tone is maintained, with sufficient volume to meet the requirements of the listener, and the instrument gives less directional effect than is usually experienced in most loud speakers.

The Electrical Trades Benevolent Institution.

Annual Festival Dinner.

Yet another successful annual festival of the E.T.B.I. has to be recorded to the credit of those responsible for the conduct of this very deserving organisation. It was held at the Trocadero Restaurant, London, on November 4th, when Mr. Edgar S. Barralet presided over some 150 members of the Institution and their ladies and guests—good support it might be thought, but why is it not an even bigger affair, especially as such good entertainment is the rule? Under the able hon. secretaryship of Mr. F. B. O. Hawes, the fund should be better supported in the provincial industrial centres. If employers would acquaint their staffs with the advantages of membership, common-sense would soon show what an extraordinary investment a modest annual subscription of 10s. is. The splendid yield, in case of necessity, to those who make themselves eligible needs to be brought more persistently before the notice of the rank and file. The insurance offered only needs to be known to be appreciated.

The Chairman proposed the "E.T.B.I.," and reminded his hearers that the electrical industry was one of the greatest and had a vast capital invested in it; numbers of people employed in it were afflicted with misfortune from time to time, and an Institution such as theirs was needed to take care of them. There were two ways of assisting the fund:—One was to subscribe that evening as liberally as they could, and the other was to do propaganda work elsewhere. It was very necessary that the inadequate pension fund should be built up to a reasonable figure, and it needed very little arithmetic to show how many subscribers at 10s. per annum would suffice to make that fund self-supporting.

Mr. F. G. Kellaway, in echoing the president's remarks, pointed out that he had been connected with the electrical industry for probably a shorter period than anyone in the room. Three years ago he was a politician pure and simple, and now he was a business man pure and simple—so far as business men were simple and pure. When his constituents tired of returning him to Parliament he looked round for something to do in an atmosphere of calm, naturally turning to the electrical industry, and again, naturally, to the Marconi Co. Everyone connected with the electrical industry must be very proud of it; the characteristics of Englishmen were shown no better than in the way the electrical industry had been built up. It had changed the character of the country. The country also had a right to be proud of the progress made in radio broadcasting, particularly on the technical side. Technically they had nothing to learn from other countries, but he was not so sure whether they were making the most of the business from the programme point of view. English people did not like a censorship, whatever form it might take, and he hoped that the Government Committee which was to consider the subject of broadcasting very shortly would take into serious consideration whether the present procedure with regard to programmes was best. He feared that it would not be so, so long as programmes were determined by one body alone. In supporting the fund, he remarked that the worst tragedies were not always found in mean streets and poor homes, but in the "black coat" classes, whose pride prompted them to maintain appearances regardless of cost. It was that class of poverty with which the Institution dealt, and it did so without allowing those helped to suffer in self-respect. One result of the war was that the people now were quicker to sympathise with the sufferings of others, and he asked all those present to express their feeling in a practical manner.

Mr. J. Snow Huddleston toasted the ladies, remarking that they did not often have that toast nowadays, but it was on the list that night because ladies were now eligible for membership and the benefits of the Institution. Amongst the ladies' duties the oldest was benevolence, and in that sphere they always surpassed mere man. With the toast he coupled the name of Mrs. A. J. Wilson, and hoped that the E.T.B.I. fund would in time be as adequate as the one for which she performed the secretarial duties.

Mrs. A. J. Wilson, secretary of the Motor Trades Benevolent Fund, in an excellent reply to the toast, said that not so long ago people would have been horrified to know that ladies had attended such a function, but she took it as a sign of grace that they had been invited that night. Born together about 1905, and both attaining their majority next year, the two funds had grown side by side, each hardly knowing that the other existed. In the case of the motor trade, the fund had met with amazing generosity, due to the large and active support of the rank and file of the trade, who, initially, were very hard to enrol as members. Gradually their efforts had borne fruit, and to-day the "black coats" formed the backbone of the fund. What was the good of employers giving generous donations if employés—the very people who would benefit—did not make themselves eligible? The royal road to success was undoubtedly live membership of the rank and file.

Mr. J. Y. Fletcher (chairman, E.T.B.I. Committee) proposed the health of the chairman, and thanked him for coming forward and fulfilling the onerous duties of the chairman's post. He had not spoken with a gloomy face, but had departed from custom somewhat and had "varnished" his face into a smile and had been "pinching" money everywhere. In the past they had been able to assist every applicant, but many people would sooner starve than ask for assistance, and the Committee was very much more worried about ferreting out deserving cases than it was about granting help. The size of their funds compelled them to go slowly, and they had no adequate means of discovering deserving cases as they should have. He was not quite sure of the figures, but about five years ago the motor trade fund stood at something like £100,000, which fact was a reflection on the electrical industry. Some names appeared on the list of donors year after year, and others gave generously, but they had failed to enlist the active assistance of the rank and file. Those were the people who would actually benefit, and it was therefore obvious that they were the members required.

The Chairman, in his brief reply, announced that the amount collected this year was £1,326 15s. 2d., and there was more to come. The sum collected at the table was £161 17s. 6d.

Between the speeches the company was entertained to an excellent (thanks to the assistance of Major H. Clifford Palmer) selection of music and song.

The Salesman's Art.

Some Desirable Qualifications.

At a meeting of the Electrical Trades Commercial Travellers' Association, at the E.L.M.A. Lighting Bureau, on October 30th, Mr. V. W. Dale, of the British Electrical Development Association, delivered an address containing a great deal of useful advice for electrical salesmen.

In his opening remarks Mr. Dale made the interesting statement that during the next year upwards of five million books, posters and leaflets would be circulated by his Association, each one going straight to the ultimate user.

The speaker stated that the salesman's task was to secure the utmost business from the largest number of customers at fair and economic prices. Efficient production was a great deal, but the creation of markets at home and overseas, and efficient selling, were equally as important. It was of no use producing more goods, even at a lower cost, unless the market for them was existent. If manufacturers founded a good organisation and produced satisfactory articles it was the duty of the salesmen to present in themselves as perfect a reflection of those meritorious conditions as they possibly could. The personal equipment of a salesman must include enthusiasm, optimism, courtesy, cheerfulness, sincerity, honesty, self-confidence, and good health. This looked a formidable list of virtues, but practically all of them were attainable by the right men. It was often debated whether salesmanship was a gift at birth or an acquired art; the principal element of successful salesmanship—self-confidence—most certainly had to be acquired.

A salesman's time was very valuable, and every available moment should be spent profitably. The speaker had heard of travellers who always drew up in advance a plan of the area which they intended to cover, marking it with railway stations, &c. It had to be borne in mind that customers' time was important, too; therefore, expositions and demonstrations should be brief, though thorough. Time could also be saved by definitely avoiding entirely and absolutely fruitless calls. A place should never be left until somebody had been seen, for generally the proprietor or the buyer had an assistant, to whom due respect should be given, for he might be the buyer or proprietor of the future.

An important part of the salesman's business was the revealing to the public of their needs, for in many directions, *e.g.*, lighting, the public were woefully ignorant concerning the full and proper usage. The average person could be told with regard to lighting that he needed extra lamps for the bed, the dressing table, &c., reading lights and better switch controls, and the same was true of small power and heating applications. When producing the influence of oral suggestion the salesman should not fall into the error of imagining that "highbrow facts" and sonorous words were necessary. More often than not something quite simple and human would provide the best starting point. It had to be remembered that when people bought electrical appliances they were really buying comfort, convenience, service and better health, and, moreover, something better than their neighbours and friends possessed. All these impulses and emotions were well worth studying and analysing, and countless avenues for the exploitation of fresh markets would be discovered as a result. Salesmen should keep themselves up to date with the whole of their principals' advertising, and should read very carefully at least one or two trade papers regularly, including a journal published by gas competitors.

A great deal of service could be rendered by salesmen to their trade customers; for instance, it was possible to convey suggestions for improving the attractiveness of windows, utilising showroom space to greater advantage, arranging periodical demonstrations, &c. This information should be imparted in a tactful manner so as not to cause the customer to feel that he did not know how to run his own business. It was necessary for a salesman to be adaptable, within reason, to the moods and peculiarities of his customers. Some buyers preferred familiarity; others did not. A sales manager should have an intimate knowledge of the temperaments of his out-door force, for it had been proved that men who

were the very best salesmen in one part of the country could ...e total failures in another district. A salesman could not ...ford to be over-sensitive; he certainly had to be long-...uffering and able to keep his temper in the very difficult ...ircumstances. In spite of every effort, failure was bound ...o come sometimes, for reasons known or unknown; the ...alesman could not afford to allow himself to be discouraged. ...n many cases failure could sometimes be more valuable than ...uccess, if only because a man did not waste his time ...ragging about it.

It was a great mistake for a salesman to load a customer ...ith material when his expert knowledge of the peculiarities ...f the local demand distinctly pointed to the fact that a ...arket for this material did not exist. Such over-selling came ...ff only once, and the policy was fatal, both to the salesman ...nd to the firm which he represented. Where, however, it ...as found that in spite of the existence of a market, retailers' ...helves were still loaded with unsold goods, the retailer ...hould be tactfully told that he was failing to make proper ...se of his opportunities, and he should be offered assistance. ...n investigating market possibilities the salesman should seek ...he aid of local directories, census returns, and supply under-...aking records, and a visit should be paid to the Town Clerk's ...ffice. In this way a great deal of valuable information could ...e obtained to make prospective sale efforts much more clearly ...efined, promising far better results than could be obtained ...y working almost entirely in the dark.

In concluding his address, Mr. Dale said that there was very indication that an immense volume of business was ...aiting and would be obtained as soon as the country really ...ettled down.

The Distribution of Electricity.

I.E.E. Discussion on Cost Reduction.

...T the opening meeting of the Informal Meetings Section of ...he Institution of Electrical Engineers, Mr. R. A. Chattock ...ook the chair and opened a discussion, in which some 15 ...peakers took part, on the subject of "How Can the Cost of ...istribution be Cheapened?"

According to the official *résumé* of the proceedings, the ...resident pointed out the facts that areas of supply were tend-...ng to become larger, and densely-populated districts were ...eing extended to cater for residential demands situated at ...onsiderable distances. Existing methods of distribution were ...ot applicable to these new areas, and rural districts were also ...eing developed which required still different treatment. A ...omparison between the costs of the networks in Birmingham ...as as follows:—

	L.p., d.c.	*E.h.p., a.c.*
Total cost	£1,052,520	£408,790
kWh sold, year ending March 31st, 1925	60,200,000	100,735,740
Revenue from kWh sold ...	£546,838	£426,691
Annual return per £1 capital	10s. 5d.	£1 0s. 10d.

Most large towns had d.c. distributing networks fed from ...ub-stations and when the feeders supplying those networks ...ecame fully loaded it became necessary to lay additional ...eeders, or arrange to boost the pressure on the fringe of the ...etworks by means of automatic converting plant. At a point ...n Birmingham 1,200 yards from a sub-station where the net-...work was overloaded, the cost of a 1.0 sq. in. feeder cable, with ...dditional rotary converter plant and switchgear in the main ...ub-station would amount to £9,400; the annual losses in con-...ersion, boosting, and cables at ½d. per kWh amounted to ...£1,380; and the interest and sinking fund charges on the ...apital outlay at 8 per cent. amounted to £752; the total annual ...harge being £2,132.

The cost of an automatic 550-kW mercury-arc rectifier equip-...ment with building would be £8,200; annual losses at ½d. per ...kWh would be £270; capital charges would be £660; and the ...otal annual charge £930. The cost of an automatic 500-kW ...otary converter equipment, with building, would be £6,500, ...nd the total annual charges £790.

Another way of relieving the d.c. network was to transfer ...ower consumers to the e.h.p. system. Hitherto, consumers ...f less than 100 h.p. had been connected to the d.c. system, but ...ow that the e.h.p. mains covered practically the whole of the ...ndustrial section of the city, arrangements were being made ...o connect power users of 30 h.p. and upwards to the a.c. ...nains, and to employ a simple form of e.h.p. switchgear with ...a "tee" off the main. The saving in cost for a consumer ...,000 yards from the nearest source of supply and requiring ...00 h.p. installed was as follows:—

	D.c.	*A.c.*
Capital cost of transforming plant and cable	£1,950	£1,040
Annual cost of maintenance losses and capital charges at 10 per cent. ...	£277	£140
If cables were available close to consumer's premises and a proportion of them was allocated for his load, the comparison was as follows:—	£157	£33

For an outlying residential district, a d.c. network fed by ...eeders from a central rotary-converter sub-station was not ...uitable, as the density of loading would not justify the ex-...enditure. The cheapest form of distribution was a four-wire network fed by three-phase transformers with a pressure of 400 volts between phases.

For rural supplies, overhead distribution must be used, and a system must be designed as simply as possible with the details standardised. The Shropshire, Worcestershire, and Staffordshire E.P. Co. had developed a system for the large number of villages in its area, and the chief engineer, Mr. J. T. H. Legge, had furnished the following particulars:—

Overhead four-wire distributors were fed by transformers at frequent intervals, strung on poles. Wires strung in the same horizontal plane had a tendency to swing together, so they were placed vertically close to the poles, which arrangement enabled service wires to be taken off in a very simple manner and a cheap form of bracket to be standardised. Wires of different potential need never be crossed.

The cost of four-wire 0.05-sq. in. lines with an earthed neutral was as follows:—

Length of line.	*Cost per mile.*
2½ miles along roads	£399
1½ " " "	£411
Short lengths	£447
Poles in meadows.	
1 mile	£382
Short lengths	£395 to £448

The comparison between overhead and underground work was as follows:—

E.h.p. lines. *Size.*	*Cost per mile.* *Overhead.*	*Underground.*
3 × 0.1	£931	£1,804
3 × 0.06	£792	£1,628
L.p. lines.		
4 × 0.1	£572	£1,731

London and Home Counties Electricity District.

Inaugural Meeting of the Joint Electricity Authority.

On Wednesday, November 4th, the first meeting of the Joint Electricity Authority for the London and Home Counties Electricity District was held at the Institution of Electrical Engineers, London. Sir John Snell, G.B.E., chairman of the Electricity Commissioners, opened the proceedings as acting chairman, with a review of the history of electricity supply in London since the time, 20 years ago, when a Bill for the supply of the area was passed by both Houses of Parliament and only failed to become law by mischance. He had been concerned with the problem since 1905, in connection with the London County Council, and was familiar with the various schemes which had been put forward but had not matured. The District was provisionally determined by the Commissioners on July 17th, 1920, and local inquiries were held on the schemes submitted to them; the Order constituting the District and establishing the Joint Electricity Authority of 33 members was approved by Parliament and came into operation on July 29th, 1925, whilst the London Electricity Acts, Nos. 1 and 2, with which the scheme was closely bound up, became law two days later, empowering the company undertakers to amalgamate, extending their tenure till 1971, and making them subject to a sliding scale of price and dividend.

The area of the District was 1,785 square miles* and the population was nearly 8¼ millions; the assessable value was about £73,000,000. There were 43 local authority undertakers and 44 companies authorised to supply electricity in the District. The total capital expended on the electrical undertakings at the end of March last was £51,000,000. Since 1919-20 the maximum load (excluding traction) had grown from 320,000 to 535,000 kW, and the energy generated from 715 to 1,238 million kWh, an average growth of 15 per cent. per annum; the load factor remained at 26.7 per cent. Including the traction stations, the maximum load last year was 632,840 kW and the energy generated 1,950 million kWh, at a load factor of 35.8 per cent. In 15 years the load would probably be 1,682,000 kW and the output 4,000 million kWh.

It was clear that the Joint Electricity Authority would have duties involving great responsibilities. It would be able to assist the Commissioners in bringing about a reduction of the number of pressures and systems now extant and in simplyfying the tariffs in vogue; it would have to consider any unoccupied areas in the District with a view to providing a supply of electricity; it could borrow money up to a limit of £7,000,000, and issue stock. The Commissioners had always taken the view that in the performance of their own duties they must not be actuated by any other than technical considerations consistent with their legislative powers in seeking to secure for all an adequate supply of electricity at the lowest possible cost. He hoped that a similar objective with regard to the District would commend itself to the members of the Authority, and that all concerned would work together for the development of a great public utility service, and he concluded with an expression of appreciation of their public spirit in undertaking their great responsibilities.

Sir John Snell then invited nominations for the office of Chairman, and Ald. Vorley, J.P., of Islington, proposed the

* See page 764.—Eds.

name of Ald. Duncan Watson, J.P., M.I.E.E., as a man of outstanding ability, of wide municipal and administrative experience, a successful business man, and a technical man of high standing; he had been chairman of the Committee of Local Authorities for the past nine years, and it was largely due to his tact and experience that all parties were brought into accord. Sir HARRY RENWICK, K.B.E., cordially supported the proposal, remarking that amongst Mr. Duncan Watson's many qualities were personality, impartiality, and vision, which were most important for the post. Councillor ODELL, of Ilford, supporting the nomination, added to these qualities firmness and courage. There was no other nomination, and the motion was carried unanimously with enthusiasm.

On taking the chair, Mr. DUNCAN WATSON expressed his keen appreciation of the honour accorded him, and his sense of the great responsibilities imposed upon the Authority, whose duty it would be to place London in the van of electrical progress. In future all barriers must be swept aside, and all must work together in harmony. He would devote his whole energy to the maintenance of goodwill between all parties, to hasten the victory over inefficiency and retrogression.

The Authority then proceeded to deal with the agenda that awaited its attention. Major C. R. Attlee, M.P., vice-chairman of the Conference of Local Authorities, was elected as vice-chairman of the Authority, and Mr. Gardner, of the staff of St. Marylebone M.B.C., undertook the duties of temporary clerk, until a permanent official should be appointed.

MEMBERS OF THE JOINT ELECTRICITY AUTHORITY.

Appointing Bodies.	Members Appointed.

SECTION 1.

Corporation of West Ham: Alderman G. Croot.

Company undertakers:—

(1) Committee Company (10 companies): Mr. W. F. Fladgate, M.V.O., J.P. (Charing Cross Co.).

(2) The Four Companies: Sir Harry Renwick, K.B.E. (County of London Co.).

County Councils:—

(1) London County Council: Mr. A. Emil Davies; Mr. E. M. Dence; Sir G. Hume, M.P., J.P.; Mr. W. F. Marchant, O.B.E.; Mr. Herbert Morrison; Mr. R. C. Norman.

(2) Middlesex County Council.

City of London Corporation: Mr. A. Thomas Snell, M.Inst.C.E., M.I.E.E.

Railway Companies Association: Lt.-Col. F. A. Cortez-Leigh, M.Inst.C.E., M.I.E.E., M.I.Mech.E (L.M. & S. Railway); Mr. Herbert Jones, M.I.E.E. (Southern Railway).

SECTION 2.

Metropolitan Borough Councils: Alderman Major C. R. Attlee, M.A., M.P.; Alderman J. R. Chesterman; Councillor C. W. Key; Councillor B. J. Samels, L.C.C.; Councillor W. J. Stapleton; Alderman H. B. Vorley, J.P.; Alderman Duncan Watson, J.P., M.I.E.E.; Alderman T. Watt.

SECTION 3.

Other Local Authority Undertakers: Councillor A. H. Dykes, M.Inst.C.E., M.I.E.E.; Alderman R. Moritz, K.C.; Councillor H. G. Odell; Alderman W. B. Robarts; Alderman Dudley Stuart, M.I.E.E.

SECTION 4.

The Four Power Companies: Sir James Devonshire, K.B.E., M.I.E.E. (North Met. Co., &c.).

SECTION 5.

Other Companies: Mr. K. A. Scott Moncrieff, M.I.E.E. (Hendon Electric Supply Co., &c.); Mr. P. D. Tuckett (Edmundsons, &c.).

SECTION 6.

Other County Councils.

SUPPLEMENTARY SECTION.

Employés' Organisations: Mr. I. J. Hayward (National Union of Enginemen, Firemen and Electrical Workers); Mr. W. J. Webb (Electrical Trades Union).

Mines Department Testing Station.—Col. G. R. Lane-Fox, M.P., Secretary for Mines, announces that the Mines Department testing station will shortly be transferred from Eskmeals, Cumberland, to more convenient and accessible premises which are being fitted for the purpose at 42, Arundel Street, Sheffield. A short interruption of the official testing of safety lamps and electric bells and relays will occur during the erection of a new testing gallery and the removal of apparatus from Eskmeals, and manufacturers will assist the Mines Department if, so far as is possible, they will arrange to hold over until the New Year any testing work which is not put in the testing officer's hands by the middle of November. The other work of the testing station—including the analysis of mine air and mine dust samples—will, it is expected, be carried on without interruption.

Correspondence.

Correspondents should forward their communications **at th earliest possible moment.** *No letter can be publishe unless we have the writer's name and address in ou possession.*

Rural Electricity Supply.

I have been following, with much interest, the above corre spondence, and whilst not proposing to enter the fray on th particular point at issue, I think it is to be regretted that Mr Fennell has weakened his case by trying to side-track th matter on to the I.E.E. Regulations. It gives the impressio that he felt he was losing his case and, like an astute lawyer looked for some other point on which to fasten his argument

Now it appears that Mr. Fennell, being very keen on rura development, finds two obstacles: (1) The Post Office, (2) th 1924 I.E.E. Regulations.

I only propose to deal with the latter, and would first of al refer Mr. Fennell to my article in the REVIEW of February 27th, wherein I pointed out that the Ontario Government i so anxious to develop the rural supply that it pays 50 pe cent. of the cost of rural lines, but it nevertheless finds i necessary to enforce a higher standard for installation work than that of the I.E.E. Regulations. Experience has no doub driven it to this necessity.

Then Mr. Fennell says he accepts the 1917 Edition, but not the 1924 Edition; the former contains 131 Rules and the latter 128, but a difference in the style of publication makes the 1924 Edition appear more formidable.

Mr. Fennell complains that the 1924 Edition is far too elaborate, but there, like all the other critics, he stops.

We can all put forward destructive criticism, but when it comes to sitting down and carefully thinking out something to replace that which is objected to, and which will not be open to other objections, then it is realised how difficult is the task.

When Mr. Fennell says he prefers the 1917 Edition to the 1924 Edition he is not fair to himself and has evidently not made a careful comparison between the two editions, or he would have realised that the last edition does allow greater latitude than the former editions.

I will quote one instance, *viz.*, "Testing." The 1924 Edition, as amplified in the leaflet issued this year, allows a lower standard of insulation than formerly, but Mr. Fennell evidently objects to this.

I will not occupy your space by quoting further instances, but can say that every grievance I have heard, when properly thrashed out, has proved to be that one or two regulations cut across some pet theory of the critic, and in consequence he condemns the regulations root and branch.

Let me repeat what I have said many times before: If anyone who takes exception to the 1924 Edition will send his carefully considered criticisms together with his carefully considered suggestions to the Institution, I know, as a member of the Wiring Rules Committee, that they will receive the same careful consideration.

Fredk. W. Purse,
Engineer and Manager.

Electricity Dept., West Ham, *November 6th*, 1925.

Under the above heading your correspondent, Mr. E. O. Walker, asks: "Is not the whole industry suffering from rules and regulations?" I should say emphatically, No! The rules drawn up by the I.E.E. are (in my opinion) very necessary, and the industry is suffering by these rules not being carried into effect. The fact that Mr. Walker has installed thousands of ordinary switches in places with stone floors does not prove that the rules are in error, even although Mr. Walker has not heard of any accident brought about by the use of such switches.

A great deal in your correspondent's letter is sound reasoning, but his first question and his later comment about electricity being hedged with regulations are (to my mind) unfair to a competent body like the I.E.E.

Although I am not a member of the I.E.E., I shall always give support to the rules where possible, and it is to be hoped that some day they will be carried fully into effect. Does Mr. Walker think that if there were no rules and regulations our industry would cease to suffer? I think not.

Polyphase.

November 2nd, 1925.

I am sorry that I have again to intervene in this correspondence, but the implication in Mr. Fennell's letter in your issue of November 6th that I have not written the truth compels a reply. It is indeed a novelty to me to have statements of fact which are within my knowledge referred to in such terms, but as presumably a simple and flat contradiction would not suffice in correspondence of this character, I must content myself with a more lengthy communication.

It will be necessary again to call attention to my original complaint against Mr. Fennell, which was a statement reflecting on Post Office engineers contained in the words "their talk of efficiency limits is a device to save themselves trouble." The point at issue is a simple one—are Post Office engineers lazy? Mr. Fennell has said, in effect, that Post Office engineers are so lazy that, to avoid having to place certain overhead lines underground, they invent an excuse which has no technical warrant. In reply to this charge of laziness I instanced the

fact that in the case of a power line projected by Mr. Fennell, the Post Office has offered to place its lines underground at 23 out of 29 crossings! Does this indicate laziness?

Speech efficiency of a circuit is not a myth, and, moreover, it cannot be arrived at in the manner adopted by Mr. Fennell, that is, by comparing the size of the overhead telephone wire with a 35,000-volt power line crossing a roadway. I sincerely hope that Mr. Fennell does not adopt similar reasoning as the technical basis for carrying out his distribution schemes.

The ease with which Mr. Fennell assumes that he knows all about other people's business is illustrated by his reference to his "Winsford calls," as though the function of the circuit was confined to operations between Northwich and that town. The circuit in question is one of a chain of links which may be required at any moment to make up circuits to any part of the United Kingdom, and to do this each link must have a minimum speech efficiency which is laid down, and which cannot be reduced without the possibility of long-distance calls being made difficult and unreliable. Because of the possibilities of being employed for such calls, say to John-o'-Groat's or Cork, "Z" junction circuits have an importance which cannot be appreciated by the narrow outlook envisaged by Mr. Fennell; all such circuits have their speech efficiency figures and there are no grounds for Mr. Fennell's "suspicion" "that there are no figures." I might well stop here but for the following in Mr. Fennell's letter:—

"The order was made, I suggest, on the ground that the line is too paltry to put underground in the country on the score of cost, and that as we are prepared to pay, it is merely inertia and indifference which stands in our way. I suggest that Mr. Bartholomew makes too much of the generosity of the Post Office in putting subscribers' lines underground *at our cost*. It is their well-known policy to get them underground even at their own cost as soon as they can. I expect they would be glad if we asked and paid for them all to be put underground forthwith!"

Was there ever such a farrago put forward by an engineer in a technical paper? First the Post Office will not put lines underground because of inertia and indifference, even though the power company offers to pay the cost; next it is the Post Office's well-known policy to put lines underground, even at their own cost; and, finally, Mr. Fennell expects we should be glad if we were asked and paid for them all to be put underground! This, after saying that the placing of Post Office lines underground is refused because of the "trouble" involved in carrying out such work, to say nothing of "inertia and indifference" which stand in the way. I am afraid that Mr. Fennell will make a very illogical St. George! Perhaps, after all, he is more like a Don Quixote.

Mr. Borlase Matthews, in his letter in your issue of October 23rd, said: "Difficulties are made to be overcome, so I trust others of your readers will help in the solution of the problem how best to reduce the cost of overhead construction in this country. It is no use slanging the Electricity Commissioners or telephone engineers, but rather, as Mr. Fennell has done, draw attention to definite points that require modification or suggest how they can be countered, there being more ways of killing a cat than by hanging it." If the words "but rather" be placed after "as Mr. Fennell has done" instead of before, then I think this advice is very sound.

S. C. Bartholomew.

G.P.O., London, *November 9th*, 1925.

P.S.—As regards the photograph showing the North Wales Power Company's 135-kV line, I am afraid the "innocent and hitherto smiling country side" would not be much relieved even if the cradle were removed at the road crossing.

Motor Converters versus Rotary Converters.

As a designer of both motor converters and rotary converters, I am particularly interested in Mr. Wuthrich's letter in your last issue. Although, in my opinion, the rotary converter is on the whole slightly superior to the motor converter, I do not think Mr. Wuthrich has been quite fair to the latter.

One great advantage of the motor converter is its superior stability on fluctuating loads, but Mr. Wuthrich does not mention this important fact. Operating engineers with experience in this class of plant have decided opinions on this point.

May I further comment on the seven claims which Mr. Wuthrich discusses?

1. *Possibility of connecting the plant direct to the h.p. supply without transformer up to* 11,000 *volts.*—The rotary converter certainly has the advantage stated, but, on the other hand, many engineers object to the presence of the large quantity of transformer oil in the station with its risk of leakage and fire. The fact that the transformer acts as a choking coil would appear to be offset by the fact that the motor acts in the same way.

2. *Simple starting and nearly immediate synchronising.*—The rotary converter is usually more simple in this respect than the motor converter, especially with the method of self-synchronising in which separate chokers are used.

3. *High efficiency and possibility of maintaining a power factor always in the neighbourhood of unity.*—The full-load efficiency of the rotary converter is certainly higher than that of the motor converter, but the difference given by Mr. Wuthrich hardly represents modern practice. The full-load efficiency of a 1,000-kW motor converter with two bearings is not more than 1 per cent. less than that of a rotary converter and transformer. Further, on three-quarter load the difference is less and the efficiencies are approximately equal, while on half load the motor converter may have a slight advantage. Since machines usually work at about three-quarter load in service, it will be seen that the difference in practical efficiency is quite small. For the same range of voltage, the power factor of the motor converter is slightly higher than that of the rotary, owing to the higher reactance.

4. *Large range of regulation on the d.c. side.*—I cannot follow Mr. Wuthrich's explanation of why the motor converter has a greater range than the rotary, but it is a fact that the range is greater, for the same range of power factors, on account of the higher reactance of the motor. The rotary, however, has a great advantage when two ranges of d.c. voltage are required for lighting and traction. In this case, tappings may be provided on the transformer, one set for lighting and one for traction, so that unity power factor may be obtained at the mean voltage of either range. This can also be accomplished in the case of the motor converter by providing tappings on the stator winding, but it is by no means such a practical proposition as providing tappings on the transformer. Without tappings, the motor converter gives unity power factor at the mean voltage of the total range. It does not seem fair in this comparison to introduce the induction regulator, since it must be remembered that, although its use extends the permissible voltage range, it also introduces considerable complications by adding a piece of apparatus which requires artificial cooling and additional regulating gear.

5. *Perfect balancing in the case of three-wire systems.*—The rotary has a slight advantage, in that the out-of-balance current has to be carried through brushes and slip-rings in the case of the motor converter.

6. *Small peripheral speed.*—Large modern motor converters operate at the same peripheral speeds as rotaries.

7. *Safe operation without highly trained staff.*—I agree that the operation of a rotary is as simple as that of a motor converter, and the design of the two types can be made equally simple. The weak point mentioned by Mr. Wuthrich is eliminated by building motor converters with two bearings only, so that the leads do not have to pass through a hollow shaft. Motor converters up to 2,500 kW have been constructed in this way quite satisfactorily. This method has the further advantage of reducing the overall length of the set. The fact that the position of the transformer can be chosen independently is not such an advantage as would appear at first sight, in that the transformer must be placed as close as possible to the rotary, in order to save in the length of the heavy-current leads.

As I stated before, it is my opinion that, generally speaking, the rotary holds a slight advantage, but many engineers may hold the contrary opinion. Apart from general opinions, it is only by attaching appropriate weights to the various claims in each specific case that a correct decision can be made. Each case must be judged on its merits.

The price of the motor converter is not disproportionate, being practically identical with that of the rotary and transformer, so that it is quite reasonable that engineers who have had satisfactory service in the past with motor converters should hesitate to install a different type of machine to obtain a doubtful advantage.

There seems to be no question of "encouraging the present fad" for motor converters, since manufacturers who have built satisfactory 50-cycle rotaries for many years are now building both types of machine.

Robert G. Jakeman.

Birmingham, *November 3rd*, 1925.

The two communications which appear in your issue of November 6th entirely vindicate my contention that practically in every respect rotary converters are far superior to motor converters. Although Mr. Sieveking states that he is in favour of motor converters, he has made a clear case for rotary converters, and it is only necessary to make the following comments regarding his remarks:—

1. As a transformer is indispensable even with motor converters in installations with a higher supply pressure than 11,000 volts, surely rotary converters are a far cheaper proposition.

2. Mr. Sieveking appears to have been unfortunate with the rotary converters he has had to deal with. With properly designed gear the starting-up of rotary converters should be as easy as in the case of motor converters.

3. In modern sub-stations where a number of units are installed it is usual to arrange that the rotary converters in service work at full load and consequently with best efficiency.

4. It is quite erroneous to think that an induction regulator for a large machine is too big and too costly. If the induction regulator is merely required to secure for the rotary converter the same voltage regulation as a motor converter, the internal capacity of the regulator is very small. The cost of an induction regulator for use in conjunction with a 500-kW rotary-converter equipment for a 6,000-volt, 50-cycle supply, giving a pressure range of 380/460 volts on the d.c. side, would not exceed £200.

6. The only question that matters here is whether the necessary factor of safety can be obtained at the given peripheral speed, and whether the commutation is satisfactory. These conditions are, I contend, entirely fulfilled with modern rotary converters. The fact that 50-cycle traction rotary converters for 1,500 volts, 1,500 r.p.m., are not built in this country is no argument, as such equipment works on the Continent with perfect commutation and remarkable absence of the "ploughed field" appearance of commutator alluded to by Mr. Sieveking.

7. The contention that if an induction regulator is inserted into the rotary-converter circuit, the motor converter is easier to handle, is a perfect fallacy. An induction regulator can be operated by handwheel or remote controlled by servo-motor and push button from the switchboard; it can also be arranged to deal with the whole pressure regulation of the rotary converter with as much ease as a shunt regulator.

As regards Mr. Bunting's remarks, I agree that the efficiency figures I gave may not apply to the very latest design of motor converter or rotary converter, but as both types of plant are being continually improved in this respect, the difference in favour of the rotary converter still remains, though perhaps not quite so pronounced.

Regarding the question of design, the use of two bearings in the case of motor converters removes, it is true, the necessity of leading the rotor connections through the shaft. This means, however, that either the two armatures are connected together by means of a rigid coupling, which is an undesirable feature in my opinion, or that the shaft is in one piece, an arrangement which renders repairs on the two armatures more difficult, while the fact that leads have to be run along the shaft is not wholly satisfactory.

It would appear to me that the writers of the letters I have referred to have been guided too much by their own personal experience with particular designs of rotary converters, and though they may have been fortunate in handling very up-to-date motor converters, they have overlooked the fact that considerable strides have also been made in the construction of rotary converters. That a manufacturer who can build satisfactory 50-cycle rotary converters should choose to devote also his attention to the construction of motor converters, appears to me merely to demonstrate that he chooses the path of least resistance in a conservative market, overlooking, perhaps, the fact that he is thereby unnecessarily crowding his pattern shops.

G. Wüthrich.

London, *November 7th*, 1925.

Two-way Pendant Switch Flexibles.

In your issue of October 30th, page 717, are some remarks on the part of one of your correspondents on the use of one- and two-way flexibles, for pendant switch wiring.

He states that "there is no 2-way ratchet action ceiling switch on the market." He undoubtedly is in error, because we manufacture ceiling switches, including 2-way actions. We have pleasure in handing you a leaflet out of our accessories catalogue, illustrating and dealing with these ceiling switches. This is a line which has a large sale in countries abroad, but has only a relatively small sale in this country.

The General Accessories Co., Ltd.

London, *November 4th*, 1925.

The Cost of House Wiring.

The cutting of prices for house wiring, which has been the subject of correspondence in your columns, is one which all contractors feel at times. If the wireman is working for himself he naturally can afford to cut his "profits," as his labour alone will provide him with his week's wages.

It, however, is very noticeable that, in such cases, the wiring is done in very quick time—much quicker than when the wireman is working for a contractor.

It would be very interesting if your readers would let you know what the average hours per point for a wireman and mate work out at on an average installation of, say, from ten to fifteen lights, including the fixing of all switches, plain pendants, lamps, shades, main switch and distribution board, twin lead-covered wiring.

If you would then publish a summary of the replies it would be very helpful.

In our case the average is 4½ to 5 hours per point complete for a man and his mate.

Inquirer.

November 5th, 1925.

The Metering of Three-phase Power.

The article entitled "The Metering of Three-Phase Power" by Mr. George D. Malcolm which appeared in the issue of your valuable paper for October 30th, greatly interested me and will, no doubt, be of considerable interest to a large number of supply engineers in this country.

I have, for a great number of years, given this subject special consideration and, being in touch with most of the supply authorities in this country, I have had a unique opportunity of seeing the various forms of metering employed by them. Many undertakings keep a special staff for dealing with this important part of a supply undertaking, but I have often seen not only inadequate, but frequently inaccurate, systems of metering employed. Many, I regret to say, prove unfair to the consumer.

There is no doubt in my mind that the metering of electricity supply is a subject which should receive greater attention by the Government authorities or Electricity Commissioners.

Turning to the article appearing in your columns—I was disappointed that the author confined himself to so small a part of this subject. There are really many more important points to be considered in the metering of three-phase power, and I feel sure that further investigation on this subject would interest many of your readers.

May I suggest that the problem of the correct meter for a three-phase four-wire supply be a further development to this excellent article.

This is a subject on which a great difference of opinion seems to exist. I have, for a great many years, advocated the type of meter which employs three separate elements *and* rotors as being the only true meter for such a supply. The more usual method of splitting the three current windings between two elements (or where current transformers are used, they are connected in delta and the third phase is thus superimposed on the other two) is not one which will meet all the conditions which can occur on a three-phase, four-wire supply. Large errors may occur with this meter. I have in mind one case where as much as 15 per cent. was found and this against the supply authority.

There are many other important points on this subject of three-phase metering, but space forbids entering into them here. I hope to complete a manual on "Correct Metering" one day, but unfortunately lack of time has made progress slow.

May I, in conclusion, suggest a slogan for the meter engineer: "Always install a meter which will register accurately under *all* of the conditions of load which *can* occur on the system to be metered."

H. Hugh Jaques.

London, *November 4th*, 1925.

Broadcasting Power.

I wish to express complete agreement with the remarks of Mr. H. P. Amphlett on the above subject. The matter seems rather beneath the serious notice of the technical Press, although some weeks ago I offered a protest to one of the Sunday papers against a similar article by Prof. Low. Rather than attempt to forecast the problematic miracles of a thousand years hence it is our immediate business to apply ourselves to improve the lot of the present generation, and to make such contribution to progress as lies in our power. Fiction is a thing apart. No doubt Mr. Stephen Leacock keeps his entertaining stories in a separate compartment from his University lectures—an example to be commended.

A fantastic flight of fancy coming from a member of a scientific profession and containing such emphatic phrases (from memory) as "both Sir Oliver Lodge and myself are agreed" is apt to carry conviction and to create a wrong impression among the general non-technical public.

E. W. Ashby.

Wallasey, *November 2nd*, 1925.

Is the Contracting Business Degenerating?

I was looking forward to reading in your last issue a word of commendation to "Hard-working Ex-service Electrical Contractor," but the only contribution to the discussion under the above heading was one from Mr. Barlow, which certainly was not intended to be cheerful reading for the gentleman who helped to win the war. The latter distinctly stated that he could carry out work on new buildings at 10s. 6d. per point, using all-British materials and within a radius of 20 miles of London—tested and fully guaranteed. This statement is clear enough, but in the letters which it evoked it is suggested that he is using Continental and other rubbish and that he will come to grief. This is not very complimentary to the gentleman who so recently was fighting for our existence. However, I do not suppose such innuendoes will worry him much: he has probably learned by now that the people who make them would not help him if he were down. Even if he were using material other than British, why should one describe it as rubbish? It is not necessarily rubbish because it is cheap: one might as well suggest that English cables were rubbish when they were being sold cheaper than they are to-day. I buy electric lamps cheaper from abroad than from the lamp-makers here because I prefer to have the difference between the price of them and the English in my pocket rather than in that of the English makers, and I have not found them rubbish. It is for the buyer to find out his best market, and in the case of our friend he is satisfied with the English for his materials, so what has one to cavil at? Surely he can sell his labour at whatever he likes to accept for it? Do not the majority of your advertisements read "State salary required"? In buying he possibly has an advantage over the buyers of some firms who could more correctly be described as "Order Clerks," as they are told where to place their orders by their employers, and if the employers are satisfied the buyers need not worry. But when one reads your "Correspondence" column one wonders whether they are wise in tying the hands of their buyers. When employing labour they have to pay the Union rate whether the man knows Ohm's law or has read "Chitty on Contracts," so that their only means of cutting costs is in material. "Ex-service man" buys British, but who could blame him if he bought foreign? By doing so he might miss the smile of the £1,000 (or more) a year politician who is advocating Communistic principles as far as they serve his purpose, but when down and out and the politician has retired on a pension will it matter? As one of your correspondents suggested that such people as "Ex-service man" figured among the unfortunate folk who appear in your weekly columns under bankruptcies, &c., I looked through these columns since his letter appeared and only found one wireman, 12 electrical engineers, 15 merchants, five manufacturers, and three agents. I do not know what class of business the electrical engineers carried on, but if we suppose they were

nothing more than wiremen, they were not so numerous as the merchants and agents. "Ex-service man" may reach Carey Street, but not at his present rate of progress. I see no reason why he should not develop a big business, and I have no doubt that as a practical man he will manage it just as well as his present. I can tell him for his encouragement that I had my house wired about 13 years ago at 10s. per point and that I have not yet had the slightest trouble over the work: the gentleman who did the work has now a very fine showroom in the principal street of the district and is doing a good business. I hope "Ex-service man" will succeed as well, but in the meantime he is bringing the light into many humble homes, making business for the supply companies and manufacturers, and laying the foundation of further business. He could no doubt do better abroad, but that is his business. In the meantime I think England retains a cheerful and an industrious worker.

Fairplay.

November 2nd, 1925.

Do Small Manufacturers Lack Ambition?

Talking to a business man the other day upon this subject, he said: "Small firms are such because they have little or no ambition or enterprise," but I am sure he was wrong.

In the majority of cases the reason is, I think, because they are manufacturers only, and do not fully appreciate the importance of salesmanship. It is one thing to make goods and another to sell them, and a manufacturer is rarely a salesman. An American writer has it—

> "He who whispers down a well
> About the goods he has to sell,
> Will never reap the pounds and dollars
> Like he who climbs a tree and 'hollers.'"

Every factory needs three sorts of ability to make it successful—the financier, the manufacturer, and the salesman—three entirely different aptitudes. The financier has to be the "Shylock"—to think of profit—to watch the money coming in and that going out. He need know little or nothing about the manufacturing or the sales sides of the business. The manufacturer has to look after the actual production of the goods from the raw material to the finished article. He must know how to control labour; he must be a good buyer, but need not concern himself about the finance or the sales. The salesman must know the buyers—must know how to make people desire the goods—must be able to create demand. He need not greatly concern himself about either of the other two men.

The war taught the manufacturers of this country what could be done by specialisation in the making of a small variety of articles on mass production lines. No manufacturer had to concern himself about sales, for the Government, either directly or indirectly, bought all his goods. He could devote all his time and energies to devising new methods of production and to getting the greatest output.

At the present time the larger and more wealthy firms have established selling organisations with ramifications extending all over the world, and the smaller firms find themselves severely handicapped in competition with them, for just as the specialisation in the production of goods helps to cut manufacturing costs by reducing "overheads," so specialisation in the selling of the goods helps to cut selling costs, and the lower these costs are, the greater amount of publicity which can be put out. This additional publicity brings more sales, increases production still more, and thus helps to cut manufacturing costs still lower, and so on.

I think, therefore, that it is owing to the smaller firms being unable to afford such sales organisation that they are unable to reap the advantages which publicity brings, and hence must remain small or succumb to their more wealthy competitors.

Bromley. **A. M. W.**

[It is not clear what our correspondent means by "small firms." There are many of the smaller electrical companies whose selling organisations operate with greater efficiency than do those of some "larger and more wealthy" concerns. They show no lack of ambition and enterprise. At various times there have been grouped schemes for co-operative salesmanship enabling associated firms to compete more successfully in export markets. But much depends upon what the "small firm" has to sell—whether it is a speciality or is only a standard product in which it comes up against the competition of large-scale production.—EDS. ELEC. REV.]

Firemen's Risks.

In reference to your excellent notice of the recent inquest held before me under the provisions of the local City of London Fire Inquests Act, 1888, concerning (*a*) Sub Fire Officer Sinden, deceased, and (*b*) the fire at Byron House, Finsbury Street, City, E.C., at the fire inquest and in my statutory report, I particularly called attention to my fire card and poster published by the City Corporation for distribution throughout the City, namely (see enclosed):—

In all cases of fire in buildings, cut off the gas at the meter without a moment's loss of time.

It is also important when a fire occurs to cut off the electric current at the meter.

The Fire Brigade, apparently, prefer to take the risk of electrocution rather than be deprived of the use of the electric lighting at a fire. In enclosed cutting, if correct, the Fire Brigade say:—"The risk of electrocution is inseparable from the duties of a fireman."

In my summing-up and statutory report, I put the compulsory adoption of the new regulations of the Institution of Electrical Engineers, *re* electrical wiring, second to the radical cutting-off at once of the electric current.

F. J. Waldo.

Coroner's Office,
London, *November 2nd*, 1925.

P.S.—So far as I have seen, the posters only appear in the streets and a few public buildings, *e.g.*, police stations. I think they ought to be displayed in all factories, workshops, and warehouses in preference to the fire cards.—F. J. W.

[The quotation is from a report of the Fire Brigade Committee of the L.C.C., mentioned in the *Daily Graphic* of November 2nd.

Dr. Waldo's admirable poster giving instructions for use in the event of fire, and hints for the prevention of fire, to which we have previously drawn attention, is issued by the authority of the Court of Common Council, Guildhall, E.C., and ought to be exhibited in every factory, workshop, and warehouse.—EDS. ELEC. REV.]

Legal.

Brown, Douglas & Co. v. Enfield Ediswan Cable Works, Ltd.

The hearing of this case (see our last issue, p. 759) was continued by Mr. Justice Finlay, on November 2nd.

Mr. JOHN CAMERON RENNIE, electrical engineer, said that 600-megohm cable in a contract of the kind involved was intended to be used for pressures up to 250 V. He had examined some coils of the cable and saw no sign of their having been heated by being stored too close to boilers.

Cross-examined by Mr. Barrington Ward, witness said the Cable Makers' Association rules provided that the tests should be carried out at the makers' works. He would expect the cable to be tested at the works, but would not be surprised if tests were made elsewhere because he knew it was done.

In further answers to Mr. Ward, witness said he should not expect two journeys through the tropics to have a great effect on the condition of the cable. If subjected to excessive heat the cable would be adversely affected. In reply to Mr. Wingate Saul, witness said the insulation test was an important factor. Four failures out of fifteen tests of the "Non Association" cable was a high proportion of failures.

Mr. WILLIAM H. BALLANTYNE, B.Sc., recalled, said that if the cable had been put into a place of high temperature near the boilers on board ship as suggested, he would have seen signs on the wrapping.

Mr. ALFRED T. MORRIS, superintendent of the Faraday House test laboratory, gave evidence of the tests applied to the cable. Of the "Non Association" cable which he tested, four coils were below the figure of 2,000 megohms per mile, which was the standard necessary. He thought the defects were generally due to poor rubber. Of twelve coils of "Association" cable examined, six were below the standard of 2,000 megohms per mile.

Mr. BARRINGTON WARD, for the defence, said that he submitted that as to the "Non Association" cable the plaintiffs had no claim in law. Under the Sale of Goods Act, the plaintiffs having resold and passed the cable on, had no right to reject.

Mr. WINGATE SAUL said he did not dispute that.

Mr. WARD said that would affect the "Non Association" cable, and make a considerable difference in the damage, supposing his Lordship was against him in other respects. In his submission, as to the "Non Association" cable, the position was that when the users in New Zealand, who had been in the habit of using only "Association" cable, saw that it was not "Association," they would not use it, and hence the complaints. They, therefore, made a perfunctory test, and returned it. Defendants had made thousands of miles of cable for the Admiralty, War Office, and public bodies, and it was almost inconceivable that they could have turned out such a quantity of cable which would fail. It was part of a lot of 290 miles made, and no complaint had been received from anyone else. His case was that the cable, both "Association" and "Non Association," was correct when supplied.

Mr. LL. B. ATKINSON, director of the Cable Makers' Association, said that under the Association's rules all tests had to be made before the cable left the works. They had a mutual understanding not to guarantee cable after it left the works. Bad handling would greatly depreciate cable.

Mr. A. V. DOWNTON, technical director of the defendants' Enfield works, said that the present name of the defendant company was Enfield Cable Works, Ltd. The company sent a large amount of cable to New Zealand and other countries. It had a separate testing staff, and no cable was allowed to leave the works without being tested. They had no complaints from any other customer of any "Association" cable supplied during the last three months of 1920 and the first three months of 1921. "Association" cable was known in the trade and outside the trade to have a higher percentage of rubber than "Non-Association" cable. Witness further said that when some of the cases were opened this year, he found that the coils had been improperly packed for the return journey from New Zealand.

Mr. FRANK RICHARDS, chief electrician at defendants' Enfield works, said that no cable was allowed to go from the factory into stock without a test. Tests of the cable in dispute showed that the insulation resistance was over 2,000 megohms.

Mr. G. DANIA, mechanical and electrical engineer, said that he had close upon forty years' experience of testing cable. He saw the cable said to have been returned from New Zealand. He picked up coils and found the rubber was good on some of them, while on other coils the rubber was harsh and short. Knowing that a manufacturer could not manufacture two classes of rubber at one and the same time, he was convinced that something had gone wrong and that there had been overheating somewhere, and the most likely place to have heating would be close up against the engine room or the boilers on board ship. The cable was not well packed. Rough handling and bad packing would destroy cable of the class in question, and would break down the insulation. He took three coils of the "Non Association" and of the "Association" cable and tested them. The insulation of the "Non Association" came out well, all three coils being over 2,000 megohms, and of the "Association" coils two were under and one over. In the coils under the standard the rubber was harsh and short. The cause would not be bad manufacture.

The hearing was adjourned and resumed on November 4th, when Mr. Wingate Saul applied to the Judge for leave to amend the pleadings in the plaintiffs' case. He admitted now the contention that there was no right to reject the whole consignment in New Zealand, and desired to base the claim instead on the ground of damages. He said the plaintiffs would be entitled to damages for the difference in the price of the cable as good and merchantable and its price in a defective state. In the latter condition it could be sold as bell wire.

Mr. BARRINGTON WARD objected on the ground that it would be an injustice to the defendants in that the amendment was only asked for when the case was over, and they had had no opportunity to give evidence as to the value of bell wire, &c., in New Zealand.

His LORDSHIP said that in view of the opinion he had formed, he thought it would be better to allow the amendment.

After counsel's final arguments, his Lordship gave judgment. He said that the first contract, made in July, 1920, was for the sale of fifty miles of "non-Association" 600-megohm cable, and the second contract, made in December and January, 1920-21, was for ten miles of 600-megohm "Association" cable. It was common ground between the parties that the defendants, who were people of the highest reputation in the trade and had a very extensive business in the sale and manufacture of cable, knew that both consignments were for shipment to New Zealand, and further, that they would be wanted for wiring houses or buildings for the purpose of electric lighting. Both the fifty and ten miles of cable were duly shipped and duly got to New Zealand, and there plaintiffs' correspondent rejected them, and the question with regard to the ten miles was whether they were justified in rejecting that cable. The question with regard to the fifty miles of cable was not whether they were justified in rejecting, because Mr. Wingate Saul conceded that, when it appeared that some fourteen miles out of the fifty had been sold, he could not maintain the claim that he was entitled to reject. The question with regard to the fifty miles was, it being conceded there was no right to reject, whether there was any damage, and what it should be, by reason of the fact that the cable did not come up to the standard required by the contract. When that cable got to New Zealand, one coil was tested, and that coil failed to answer the insulation test. It was common ground between the parties that the 600-megohm grade meant that there was a minimum insulation resistance of 2,000 megohms per mile. There was no doubt that the defendants undertook to supply cable which would stand that test. The question was whether it was made out, with regard to the fifty miles of cable, that, when it reached New Zealand, it failed to meet the test. He was unable to attach weight to the test which took place there. It was a test of only one coil, and was thus not a sufficient test. One coil having been tested, the rest of the fifty miles was kept in store for a rather long period. But, before the test, about fourteen miles had been sold, and there had been no complaint. He was satisfied no sufficient test was made as to the fifty miles in New Zealand. That being so, the rejection and the return were not justified. But, no doubt, the plaintiffs were entitled to say that, granted the tests there were insufficient, none the less they were entitled to go into the matter to show that, if they had tested thoroughly, the tests would have revealed the fact that the insulation resistance did not come up to the contract. Accepting that, one must look at what happened when the balance of the fifty miles got to England. The plaintiffs had got to satisfy him that by reason of what then took place that the "non-Association" cable was, when it got to New Zealand, unable to stand the test. The way they proposed to do that was to put in a report by Faraday House of a test made of a number of coils, fifteen in all. He noticed that two coils were of a very low insulation resistance indeed. With regard to one of those two coils, it was practically conceded that that must be due to some defect, a pin-hole, and that in coils such defects might occasionally arise. With regard to the other coil, on the evidence he arrived at the same conclusion that there was some mechanical defect of some sort. There were only two other coils which were below 2,000 megohms, and they were slightly below, so slightly that the view of Faraday House was at the time that the coils were satisfactory. In addition to that, he had got the fact that in 1922 a further test was made by Mr. Dania, who took three coils of the "non-Association" cable, and all the three coils answered the test. On those materials he (his Lordship) could not possibly say that it was made out to his satisfaction that when the plaintiffs, or their correspondent, rejected the cable, the cable was in such a state that rejection was justified. He could not hold that that "non-Association" cable—more especially having regard to the fact that, in addition to the two voyages, it had lain for a long period, fourteen months, in a warehouse—was in such a state when it reached New Zealand as to fail to answer to the test. He must, therefore, hold that, with regard to the "non-Association" cable, the plaintiffs' case failed. He had now to deal with a different and more difficult part of the case, that which related to the "Association" cable. It was shipped in March, 1921, and it returned in March, 1922. It was, therefore, away for about a year, and, of course, the two voyages had to be taken out of that. With regard to the tests in New Zealand, which were much more satisfactory than the tests of the "non-Association" cable because two coils were tested, he thought it might well have been wise if, when the two coils failed to answer the test, some more had been tested. When the cable returned to this country it was subjected to a test at Faraday House, and that test substantially showed that half of the coils failed to answer the test. There was further the circumstance that Mr. Dania subjected three coils to a test in April, 1922, about a month after the cable had got back, and one coil showed an insulation resistance of 3,860 megohms, and the two other coils fell much below 2,000 megohms. He saw no reason why he should not accept the Faraday House test as being substantially accurate. He saw no more reason why he should refuse to accept the rather striking figures which Mr. Dania gave him as to the three coils which he tested. He had come to the conclusion that the ten miles of cable failed to answer the contract terms, and plaintiffs must have judgment in respect of it. There would be judgment for the plaintiffs for £164, but, having regard to the fact that plaintiffs had failed with regard to the fifty miles of cable, in the exercise of his discretion judgment would be without costs.

Metropolitan-Vickers Electrical Co., Ltd., v. British Thomson-Houston Co., Ltd.

THE opening of this appeal of the plaintiffs against a judgment of Mr. Justice Lawrence, holding that the defendants had not infringed a patent owned by the plaintiffs relating to rotary converters, was reported in our last issue (p. 759). On November 4th, Sir DUNCAN KERLY, continuing his address on behalf of the appellants, dealing with the alleged anticipation of Tesla's publication, said that the synchronous motor which Tesla was working on would not start itself. He arranged his motor with a series of projections, each of which was wound with wire. He could not get the operation of magnetising and de-magnetising, and so get the thing off. What was a large synchronous motor in Tesla's day was probably a 1-h.p. one. Tesla had only done a part of what Rosenberg had done. A limit must be put on an alleged paper anticipation. They were not to assume that a paper anticipation of an early date had taught the world anything which it did not describe, and fairly describe. He contended that when the problem to be solved was appreciated, one did not find in Tesla the arrangement as described by Rosenberg.

The hearing was adjourned, and upon the resumption on November 5th, Mr. Whitehead, K.C., followed Sir Duncan Kerly, K.C., on behalf of the appellants, and at the close of their case, Sir Arthur Colefax, K.C., supported the judgment of Mr. Justice Lawrence on the issue as to the validity of Rosenberg's patent on behalf of the respondents. He said that the question of validity was in reality a matter of construction and what appeared in Tesla's prior publication. Mr. Justice Lawrence had only dealt with Claim I of Rosenberg's specification, and therefore he thought there was only one claim to be considered by that Court. The respondents denied that the alleged invention of Rosenberg was one of outstanding merit as had been suggested.

Brown Bros., Ltd., v. Bell & Pugh.

IN the Chancery Division on November 4th, Mr. Justice Romer heard an application by Brown Brothers, Ltd., Great Eastern Street, E.C., for an injunction restraining Thomas William Bell and Alfred Pugh, of Liverpool, from carrying on business as makers or dealers in radio apparatus under the name "Brown Brothers."

Mr. FARWELL, K.C., said that the plaintiffs started wireless business in 1922 and their name had acquired a reputation. Last November the defendants began to trade at Liverpool as "Brown Brothers," and had a stall at a Liverpool radio exhibition in that name. Confusion had arisen owing to the similarity of the names, and the plaintiffs were likely to suffer harm from it.

For the defendants, Mr. STONE said their trade was solely in the Liverpool district and they submitted that the plaintiffs' reputation applied only to their motor and cycle business. The defendants took the name because Mr. Pugh was for some years a traveller for a firm of Brown & Co. and he was known in the Liverpool district as Mr. Brown. There was no evidence that they had interfered with the plaintiffs' business.

His LORDSHIP held that the defendants, in taking the name had not acted honestly, but with a desire to obtain some of the plaintiffs' business. He found that in the radio trade the words "Brown Bros." meant the plaintiffs' goods and the use

them by others would cause confusion. He granted the junction.

Mr. FARWELL later said it had been agreed to treat the otion as the trial of the action, there would be a perpetual junction in the terms of the notice of motion, with costs, id the plaintiffs would waive all questions of damage.

Marconi's Wireless Telegraph Co., Ltd., v. International Wireless Manufacturers, Ltd.

A PETITION by the first-named company for an order for the ompulsory winding-up of International Wireless Manufacrers, Ltd., came before Mr. Justice Romer in the Companies' Winding-up Court on November 3rd, the petitioners being reditors for £230 for royalties on radio instruments.

Counsel for petitioners said the company was formed with capital of £100, of which £80 was paid up, but it had issued debentures for £4,000, and the debenture holders had appointed a receiver and manager.

Counsel for the respondent company asked for an adjournment to allow evidence to be filed by creditors opposing the petition. The business, he said, was growing rapidly and if the company was wound up now there would not be enough to satisfy the debenture holders. They had had to take on extra hands to cope with orders.

His Lordship adjourned the petition for a month.

Mullings v. British Thomson-Houston Co., Ltd.

MR. THOMAS MULLINGS, of Merton, on November 3rd was awarded £1,150 damages for personal injuries against the British Thomson-Houston Company, Ltd., by Mr. Justice Horridge and a special jury.

Mr. Mullings, an advertisement manager, was walking along Seacoal Lane, Farringdon Street, E.C., on November 14th, 1924, while the servants of the defendant company were moving some plant into the sub-station of the Charing Cross City and West End Electricity Supply Company, and owing, as Mr. Mullings alleged, to the negligence of the defendants' servants, a large piece of timber was allowed to fall on his head, causing concussion, laceration of the brain, and shock.

London Electric Supply Corporation Summoned.

AT the Greenwich Police Court on November 9th, the London Electric Supply Corporation, Ltd., was summoned for neglecting to protect as far as possible all parts of an e.h.p. transformer at its Deptford station to guard against danger to employés. It was stated that a man in the company's employment (Mr. C. H. Harwood) was killed recently by coming into contact with a "live" part of the transformer, receiving a shock at 10,000 V. After hearing evidence the magistrates adjourned the summons.

Theft of Radio Apparatus.

AT Nottingham on November 7th, G. E. Morris, a clerk in the employment of the General Electric Co., Ltd., was sentenced to six months' imprisonment in the second division for stealing radio apparatus from his employers. F. S. Freeman, trading as the Super Radio Co., and C. Baker, a traveller, received similar sentences for receiving the goods.

Millet v. Kaplan.

IN the Mayor's and City of London Court, before Judge Shewell Cooper on November 6th. Mr. J. Millet, 22, Farringdon Avenue, wireless material merchant, sued Mr. H. Kaplan, trading as H. Arnold, 35, Euston Arcade, St. Pancras, for £37 8s. 6d. for goods supplied. The delivery of the goods was admitted, but the defendant contended that the goods were supplied to a company called the Standard Accessories Co., Ltd., of which he was the managing director, and not to him personally. Evidence was given by Mr. Millet and a traveller in his employment that they had had an interview with the defendant at the offices of the Standard Accessories Co., Ltd., in the course of which Mr. Millet asked Mr. Kaplan to be responsible for the goods which had been ordered. Although Mr. Kaplan refused to give a written guarantee, he said that he would guarantee payment. Mr. KAPLAN said that the goods were ordered on behalf of the Standard Accessories Co., Ltd., and he had refused to give a personal guarantee. He admitted that the Standard Accessories Co., Ltd., shortly afterwards went into voluntary liquidation.—Judge SHEWELL COOPER said that the defence was of the most flimsy description. He gave judgment for the plaintiff for the amount claimed, with costs.

Hydleman v. Goding.

IN the Mayor's and City of London Court on November 5th, before Mr. Registrar Dell, Mr. L. J. Hydleman, trading as L. J. Hydleman & Co., Queen Victoria Street, E.C., claimed £3 11s. 9d., the balance of the amount due for the supply of H.P. radio batteries to the defendant, Mr. R. R. Goding, trading as the National Wireless & Electrical Co., Gray's Inn Road, W.C. For the plaintiff it was stated that the bulk of the money due had been paid, and upon making the last payment the defendant apologised for the delay which, he said, was due to slackness of trade. Eventually, however, he refused to pay the balance now sued for and returned a number of batteries as defective. The plaintiffs refused to accept them, alleging that they had been maltreated. The defendant maintained that the batteries were defective and had not been improperly treated by him. Delay had occurred in returning them because he had waited until a number were proved defective.

The REGISTRAR said that such delay in returning goods alleged to be defective was always viewed with suspicion. The fact that defendant had paid part of the cost of the batteries without complaint led him to conclude that the defence failed. Judgment was given for the plaintiff for the amount claimed, with costs, and an order for payment within 14 days was made.

German-American "Bosch" Litigation.

MR. JUSTICE ASTBURY, in the Chancery Division, on November 4th, gave judgment in this case, which was reported in our issues of October 30th (p. 719) and November 6th (p. 758). His Lordship said that the Robert Bosch Aktiengesellschaft, of Stuttgart, was formed by Robert Bosch, who was the originator of the well-known Bosch magneto and other electrical apparatus. A name mark, unless represented in some special manner, could only be registered under the provisions of subsection 5, section 9, of the Trade Marks Act, 1905, and it was one of the most difficult classes of marks to be placed on the register. The real question which he had to decide was whether the word "Bosch" in the circumstances proved in evidence was distinctive of the products of the Stuttgart firm within the meaning of the statute. In order to succeed the applicants must prove that substantially all people in this country dealing in this class of goods at the date of the applications recognised Bosch as meaning and only meaning the goods of the Stuttgart firm. It was not disputed that up to the outbreak of the war "Bosch," applied to electrical apparatus, meant and was distinctive of the goods of the Stuttgart firm; but it was contended that from the date of the commencement of the war circumstances had entirely changed in this country and that Robert Bosch himself had recognised that change. He thought it was accurate to say that from 1914 to 1922 the date of the applications in this case, there were as many, if not a great deal more, American Bosch units in this country than there were Stuttgart units. In these circumstances it seemed to him hopeless to suppose that the people who handled the enormous bulk of the American Bosch property could have all or mostly supposed that it was property coming from the German firm marked as it was with American indications. Nor did he believe, having regard to the evidence, that anything like the whole of the people who dealt with these matters believed that they were made by the American branch of the Stuttgart firm. Even if they did they would still be the products of an independent Corporation in America in which the Stuttgart firm might, or might not, have been interested. From 1914 to the present date there had been as many Bosch units in this country coming from America as from Stuttgart. It was absolutely impossible to say that the surname Bosch meant Robert Bosch's goods, and his only. If this registration were allowed his Lordship could see no end to the litigation that might be caused to innocent people who had purchased and were using those American goods. His Lordship allowed the appeal and directed the applicants to pay the costs.

Reviews.

Oscillographs. By J. T. IRWIN, M.I.E.E. Pp. xii+164; figs. 81. London: Sir Isaac Pitman & Sons. Price 7s. 6d. net.

Till recently, the comparative paucity of English books dealing with electrical instruments was rather remarkable. During the last few years, however, a number of excellent works on this subject have been published, and the literature is now fairly complete. The work before us will undoubtedly fill one of the few gaps still remaining, and on general grounds a treatise on oscillographs is welcome. The fact that the author of the book is so distinguished an authority on this subject gives additional interest to its appearance, and we are not surprised that, in a relatively small space, Mr. Irwin has presented a thorough and readable account of the various types of oscillograph now available. The work is generally theoretical in treatment, and a sound knowledge of elementary mathematics is necessary for intelligent reading.

The opening chapter deals with the elementary theory of a vibrating wire carrying a current in a magnetic field; and the student will do well to master this thoroughly before proceeding to the main contents of the work. The various types of oscillograph are each considered fully, the theory being worked out in each case. The consideration of the cathode ray instrument is deferred till the end of the book, when the principles are briefly considered and the principal types described. The lengthy chapter on errors of indication and methods of damping is a most important one, and considers fully the numerical interpretation of oscillograph records. The author, using the vector method of representing the various forces acting on the vibrating wire, shows clearly the effect f

damping on the indications of amplitude and phase of the harmonics of the wave under consideration.

Working out a particular case, it is shown that at a frequency of 0.2 of that of the resonant frequency of the wire, the amplitude is 4 per cent. too high and the phase error is 0.57 deg. without damping, whilst with critical damping the amplitude error is 4 per cent. low, and the phase error is 22.5 deg. The author also points out that with oil damping the resonant frequency is reduced to a greater extent than that caused by damping alone owing to the increased effective mass of the wire due to movement of the oil. The theory of the author's resonant shunt is then dealt with and it is shown that, with this method, not only is the amount of damping adjustable and definite, but that for any given value, the magnification and phase displacement are such as would be given by a massless viscous damping fluid. This interesting chapter embodies a large amount of the author's original work on the subject.

It is somewhat ungracious to offer a word of criticism on so able a book as the one under review. We wish, however, that Mr. Irwin had given a little space to practical directions in the use of the oscillograph. This instrument is no longer confined to the research laboratory, but forms part of the testing equipment of even moderate sized electricity undertakings. A little space devoted to details of manipulation would, we feel sure, have been very acceptable to occasional users of the instrument. Otherwise, we can cordially recommend the book. It is well written and produced, the illustrations are of a high order, and a bibliography is appended, giving references to the most important papers, for the use of those wishing to pursue the subject.

Phases of Modern Science. Pp. viii + 232. London: A. & F. Denny, Ltd. Price 3s. 6d.

This is the second edition of a volume published in connection with the excellent science exhibit, arranged by a Committee of the Royal Society in the Pavilion of H.M. Government at the British Empire Exhibition; a large number of distinguished authors have contributed to its contents in the form of short articles, which have been revised; some of those which appeared in the former edition have been omitted, and others relating to the exhibits in their altered arrangement have been added. These articles occupy 158 pages, the rest of the book being a guide to the exhibits, many of which are demonstrated in operation.

We cannot speak too highly either of the exhibits or of this volume. The authors of the 23 articles are pre-eminent in their respective subjects, and have succeeded in compressing into small space a wonderful amount of up-to-date information, in a form suitable for the digestion not only of the scientific reader, but also of the inquiring layman. An interesting feature is the frontispiece—a reproduction of a large wall diagram forming one of the exhibits, which shows the whole range of electromagnetic waves, covering 62 octaves, from a wave-length of 0.01 Angstrom unit to one of 852,000,000 cm.—all of which waves travel with a uniform velocity of 30,000,000,000 cm. per second. The general use of radio telephony has gone far to familiarise the public with the idea of "waves," and to awaken an interest in science which will be further stimulated by the Science Exhibit and such works as the one under review.

Trade-mark Applications.

THE following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from November 4th :—

Noris-Chromo. No. 456,466; Noris-Excello, No. 456,447; and Noris, No. 456,448. Class 4. Electric and galvanic carbons; and Noris-Tubus, No. 462,367. All goods in Class 4.—The firm trading as C. Conradty, 9, Spittlertorgrab, Nuremberg, Germany. (British representative: S. Sokal, 1, Great James Street, Bedford Row, W.C.1.)

Silex. No. 459,348. Class 6. Electric drills, hammers, grinders, and parts thereof.—B. E. N. Patents, Ltd., 100, Victoria Street, S.W.1.

Verniometer. No. 460,625 All goods in Class 8.—India Rubber, Gutta Percha & Telegraph Works Co., Ltd., 106, Cannon Street, E.C.4.

Dumetohm. No. 462,245. Class 8. Electrical resistances.—The Dubilier Condenser Co. (1925), Ltd., Victoria Road, North Acton, W.3.

Somnium. No. 462,650. Class 11. Electrical apparatus for use in light therapy.—John Bell & Croyden, Ltd., 50-52, Wigmore Street, W.1.

Published Specifications.

Compiled expressly for this journal by Patent Agents.
The name of the applicant's patent agent, if any, will be found on the printed specification.
The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

1924.

9,417. "Starting apparatus for electric motors." R. W. Cousins. April 14th, 1924. (241,241.)

The "Kennelly-Heaviside" Layer.—Writing to *Nature* of October 24th, Dr. Alexander Russell points out that "the hypothesis of an electrically conducting stratum in the upper air was clearly enunciated in an article by Prof. A. E. Kennelly, of Harvard University, published in the *Electrical World and Engineer* of New York on March 15th, 1902. The official date of Heaviside's disclosure of his hypothesis is December 19th, 1902. About the same date H. Poincaré, A. Blondel, and C. E. Guillaume made similar hypotheses. If names are to be attached to this hypothetical layer it should be called, in equity, the 'Kennelly-Heaviside' layer, a name which is beginning to be used in America."

The

Electrical Review

VOL. XCVII. NOVEMBER 20, 1925. No. 2,504.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE, M.I.E.E. A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address: "AGEEKAY, CENT., LONDON," Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d.; Colonial and Foreign, £2 1s. 6d. per annum. Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

Rural Electricity Supply.

ALTHOUGH Parliament has resumed its sittings we fear that the long-promised statement of the Cabinet with regard to its electrical policy will not be made for some weeks to come. The report of Lord Weir's Committee was presented to the Minister of Transport on May 20th—exactly six months ago—and yet, apart from more or less intelligent forecasts on the part of an enterprising Press, followed by official denials from persons in authority, the subject has remained shrouded in mystery. Does the Government realise that the result has been to put a brake upon the wheels of progress? Uncertainty as to the future is fatal to enterprise; it is better to know the worst than to be tormented with doubt, and whilst we have serious misgivings as to the intentions of the Cabinet, anything would be better than continued suspense. It is generally assumed that the policy under consideration involves a heavy capital outlay, and that the delay is largely due to the difficulty of finding the money, a theory which certainly has an air of probability, and is accepted as fact by the gas companies, which lose no opportunity of vigorously protesting against the subsidising of electricity supply by the State. We sympathise with them, feeling that the benefit of such a subsidy would be outweighed by its accompanying disadvantages. But is there not plenty of scope for progress, without awaiting further legislation?

One of the most important subjects to which the Electricity Commissioners might usefully turn their attention is that of rural electricity supply. That development in this direction is more and more engaging the activities of supply station engineers in provincial centres is evidenced by the articles and letters which have appeared in our pages, by recent references in the proceedings of the Institution of Electrical Engineers, and by communications which have reached us from other sources. In this issue Major T. Rich tells us of the progress that is being made in France, and illustrates some of the overhead construction employed for that purpose, which is conspicuously free from costly and dangerous safeguards such as that to which Mr.

W. Fennell recently drew attention. We notice that our agricultural contemporaries devote a considerable amount of space to the subject, and call for cheaper methods of distribution as the first step towards the electrification of the farm. In his presidential address Mr. R. A. Chattock referred to the high cost of distribution, and opening a discussion at the Informal Meeting a few weeks ago he gave some particulars of the interesting methods adopted by Mr. J. T. H. Legge in the Shropshire area, which brought the cost of construction down to about £400 a mile. (But that is still too much.)

In his inaugural address to the North-Eastern Centre of the I.E.E., the chairman, Mr. R. W. Gregory, referred to the legal restrictions which hamper the electrical industry compared with the conditions abroad, and said our high ideals of service and public safety combined to make electrical distribution too costly for rural districts; rural electrification deserved the study of all supply engineers, and the essential to the solution of the problem was the reduction of the capital cost even at the expense of the service given—a 90 per cent. service was much cheaper to give than a 99.9 per cent. service, and the former was all that was necessary. Cheap h.p. distribution lines were necessary to supply farms and villages, and the existing regulations should be relaxed; the ice loading figures in particular were needlessly severe, and from £50 to £80 a mile could be saved in this respect. "The dangers of overhead lines to human life with modern methods of construction and protection are infinitesimal."

Mr. J. W. Burr, of Swansea, similarly addressing the Western Centre, emphasised the necessity of reducing the cost of distribution in rural districts; and Mr. J. P. Thompson, in his address to the Dundee Sub-Centre, said electricity should be brought within reach of as many farms as possible—it could not be done too soon. In his own area a supply was already given to some 50 farms, and he knew how greatly its advantages were appreciated by the farmers. Again, Mr. A. G. Ellis, chairman of the North-Western Centre of the Institution, said the development of rural electricity supply for agriculture was a subject which was at last receiving the attention it deserved. It presented an enormous new field with a possible demand of from 500 to 1,000 million units per annum. He devoted much attention to this subject, and pointed out that cheap power supply was largely dependent on the cost of transmission lines and of tapping them. The regulations for the construction of overhead lines should be simplified, and he hoped the Electricity Commissioners would exercise their influence in that direction. It could surely be left to the common sense of electricity undertakings to see that their lines were both safe and sightly.

We may remark that the addresses from which we quote are exceptionally interesting and well worthy of reading *in extenso* when they appear in the *Journal* of the Institution. That so many of them should dwell upon the importance of rural electricity supply and of less restrictive regulations cannot be a mere coincidence—it indicates an awakening to the needs of the rural population, which can only be met by cheaper distribution.

An Electrical Fair.

If the hopes and expectations of the Government and of the organisers of the British Industries Fair are realised, that event in February next in London and Birmingham will reach a record level. We profoundly trust that such will be the case, for we believe that the time has arrived when a truly representative effort of this kind, as distinct from the ordinary exhibition, will give a splendid boost to the sale of British-made goods in our export markets. To our minds it is not right that Fair after Fair should be allowed to pass without the electrical trade participating on a reasonable scale and in a more or less specialised way suited to a Market Fair rather than an Exhibition as it is generally understood by electrical men. We are not for a moment suggesting that there shall be an exhibition, either in London or in Birmingham, of large electrical manufactures, but there are many classes of electrical goods and apparatus which could appropriately and profitably be displayed when so many foreign and Colonial buyers are visiting these shores to find out what British manufacturers and traders have for sale. Some electrical manufacturers have applied for space already, but we urge many others seriously to consider their attitude and try to give the Fair, at any rate at Birmingham, an electrical reputation which will bring more electrical buyers. As we have already stated, special funds have been allocated by the Government to give the Fair full advertisement in the countries from which visitors are desired, and the electrical industry should, somehow or other, secure its share of the advantage accruing from such publicity. It has been hoped again and again that the British Industries Fair would become an event of such popularity and dimensions as to do for our trade what Leipzig has for years past done for Germany. We think that such an end is not only desirable, but is attainable, and we put it to electrical traders that they should make a strong feature of their products at Birmingham next year. We are not concerned so much with whether they have individual stands as they have had on some former occasions, or whether they have grouped and co-operative collections of electrical apparatus, devices, domestic appliances, switches and switchgear, fittings, materials, cables and wires, and so on, which can be more or less easily brought together and treated as a trade demonstration. An effort for export trade hardly falls within the scope of either the E.D.A. or the E.C.A., but possibly the Cable Makers' Association, the Electrical Accessories' Manufacturers' Association, or certain groups within the B.E.A.M.A., might consider it worth while to provide the funds for a moderate exhibit. The thing is, in our estimation, well worth trying. If the results proved satisfactory it would be easy to decide whether the Fair would have a permanent Electrical Section. That we can leave for the present, but so far as 1926 is concerned the buyers are being invited in their thousands. It is for us all to see that they find electrical products on sale—chiefly, of course, at Birmingham.

On Reading the "Electrical Review."

In the preparation of the Electrical Review we follow as far as is humanly possible a definite order and plan so that the regular reader will know just where to find any particular section or feature. It is our aim to facilitate reference to information collected by our elaborate organisation so that contents, whether of an advertising character or of new service, may be promptly used. Having finished this part of our work with efficiency plus due humility, we leave it to the usual organisations to see that the Review reaches the hands of those whose interests it is designed to serve. But have we not the right to inquire whether the mass of material thus prepared and distributed is made use of with the same efficiency as marks its production?

Much has been said about how to write for the Technical Press, but there is need for advice to be given how to read it. We refrain from a general homily and concentrate upon one aspect of the question which has been impressed upon us again and again.

Electrical companies, through their directorate and management, recognise the need for ordering a certain number of copies of a journal for circulation through so many departments, each copy being marked to pass through the hands of certain specified members of the staff. There is no better system of ensuring that every member is kept up to date in his study of technical, trade, and financial development if this wheel of service be kept in continuous revolution, but if it has to touch too many men in passing, it is subject to stoppages, delays, the journal receives only hurried glances—not even a casual study perhaps if one is pressed for time, and sometimes it happens that the man whose name is at the bottom of the list receives the copy after other and later issues have begun the round. Two points at least emerge from a study of this matter. One is that

no circulating arrangement can expect to be efficient which requires a single copy to cover too many members of the staff; the expense is so slight in proportion to the value of the service that no concern zealous for the up-to-date mental equipment of its officers can afford to economise here. The other point is the need for staff men to have their own copies of their technical paper to read in the train, or at home. We urge a more general personal use of the ELECTRICAL REVIEW; the regular personal possession of his own copy by every man anxious to succeed in his electrical calling; and the more generous provision of office and departmental copies. The main thought that is in our minds in setting down these observations is the desire that the publication that we produce shall be utilised to its maximum efficiency for the benefit of the industry and those engaged therein.

Radio Wave-lengths.

THE practice of publishing nominal wave-lengths which are not utilised by radio-broadcasting stations and varying from time to time those actually in use, by accident or design, is a very questionable policy. When one station varies its wave-length, several others very soon do likewise in order to mitigate interference; such proceedings cause endless inconvenience and annoyance, and no sooner is the trouble settled in one locality than it is restarted from another source, as was forcibly demonstrated in the tests carried out last summer by the Geneva International Broadcasting Bureau in connection with the unenviable task it set itself of readjusting European wave-lengths. It would seem to be very desirable that it should be made obligatory that each and every station shall adhere strictly to its particular wave.

Moreover, a few metres must be left free on either side of every wave-length used, because a station swings when modulating. The swing increases as the wave is lengthened, and it therefore appears that much shorter waves than those in present use will have to be sanctioned for broadcasting purposes sooner or later so as to make it possible to accommodate the largest number of stations with maximum free zones between them.

Elsewhere in this issue Mr. W. Moon suggests that when selecting wave-lengths for new stations, reference should be made to a schedule in which the wave-lengths are arranged in geometrical proportion, so that they may be equally spaced as regards interference with each other. It would seem that the habit of measuring wave-lengths in metres will have to be abandoned. Because the amount of separation between short-wave stations need not be nearly so great as that necessary between long-wave stations, the requisite "free-space" to eliminate jamming cannot be simply expressed in metres of wave-length. If, however, the kilocycle definition were adopted generally, the estimation of interference reduction would be much simplified, for wave-lengths could then be allocated in exact multiples of 10 kilocycles.

The Coal Trade Inquiry.

ON Wednesday last week the Coal Commission heard the evidence of Sir John Snell, chairman of the Electricity Commissioners, on the relations between the development of electricity supply and the nation's consumption of coal. Anticipating, no doubt, the report of the Commission for the past year, the issue of which has been awaited for some weeks but is, we believe, now pending, Sir John said that at the end of 1924 the consumption of electricity per head of population in this country, including both public and private generating plant, was estimated at 220 kWh. It is interesting to observe that even to-day it is believed that the output of private plant is not much less than that of the public supply systems; had it been wholly provided by the latter, their load factor would have been much better and electricity would have been cheaper all round. Sir John expects that in 15 years the consumption will have reached 500 kWh per head per annum, the total being increased from 7,000 to 21,000 million kWh per annum. However, the amount of coal consumed by the electricity supply industry will increase only from 8 to 17 million tons, owing to the greater efficiency of the modern generating plant concentrated in large power stations, and the coal consumption of the whole country will diminish as the result of improved efficiency on the one hand, and the replacement of the open domestic fireplace by gas and electrical heating systems on the other, together with the electrification of the railways. The reduced demand for coal will be offset by the development of other British industries resulting from the cheapening of power.

Apart from the actual figures, all these points were dealt with in the Ministry of Reconstruction's report, the recommendations of which are being carried into effect by the Electricity Commissioners; that the progress made during the past seven years has been so slow is largely due to the limitations imposed upon the powers of the Commissioners by Parliament, the removal of which, as they hinted in last year's report, may be necessary if they are to fulfil their primary mission. Even now their hands are tied by the Government's delay in dealing with the report of Lord Weir's Committee.

With regard to the lack of success in bringing about comprehensive amalgamations, Sir John said there was a tendency to try to retain the local generating station in the face of a cheaper alternative, and whilst he would not express an opinion as to whether the Commissioners should be armed with further powers of control, he stated that his estimate of the consumption 15 years hence was not based on normal development without legislation, for he assumed that further powers would be given to them. Taking this admission in conjunction with the fourth report of the Commission, and his remark in reply to the chairman that the matter was under the consideration of the Government, we need not be at a loss regarding the opinion which he withheld.

Finsbury Technical College.

THE very successful dinner of the Old Students' Association of Finsbury Technical College that was held at the Engineers' Club on Saturday last, afforded no symptom of approaching dissolution, so far as the Association was concerned; unfortunately the College itself is not in so happy a position. Failing something in the nature of a miracle, we fear its doom is sealed; owing to the financial stringency resulting from the war, the City and Guilds of London Institute, the London County Council, and the Board of Education are unable to continue the contributions to the funds which they guaranteed for five years in 1921, and consequently the doors will close next summer.

Thus will come to an end a career of over 40 years, during which, by the genius and capacity of its teaching staff, including such men as Ayrton, Perry, Silvanus Thompson, Armstrong, Meldola, and their distinguished successors, the College has earned world-wide renown.

We are glad of this opportunity to draw attention to the efforts exerted by the Council of the O.S.A. to avert the impending fate of the College—especially by the special Committee appointed for the purpose, comprising Messrs. E. S. Conradi, A. J. Chapman, and H. D. Symons. The self-sacrificing industry and resourcefulness of these gentlemen has been beyond praise; they have left no stone unturned in their endeavours to obtain the financial support and personal influence necessary to attain their object, and if the result has been failure, it has not been for want of trying. The lovers of Finsbury owe them a debt of gratitude.

We believe the situation could still be saved if some public-spirited person would come to the rescue with substantial funds. Failing that, the only gleam of hope lay in a suggestion put forward by Prof. Hale, that the College might become a centre for the promotion of chemical engineering. The Department of Applied Chemistry has a distinguished record of achievement, and might possibly be extended to fill the need for such an institution as that mentioned above. We trust that this, at least, may be accomplished.

Recovering Fuel from Ash and Clinker.

Some Modern Methods of Separation.

By C. H. S. TUPHOLME.

To the majority of power-house engineers and fuel technologists the term "fuel economy" generally conveys the impression of burning fuel more efficiently, by the employment of correctly-designed furnaces, and attention to draught regulation, fuel firing and fuel-bed thickness. Vital though these considerations are, there is another aspect of fuel conservation which is only too often overlooked; that is the recovery of combustible matter from ash and clinker normally discharged as worthless. Considerable success in this direction has already been achieved in Britain, and there is now available a number of separators and fuel-recovery machines which have proved well worth their initial outlay. Not only tests, but every-day operation, have shown astonishing results in separating combustible material from real waste. There is no doubt that in all industrial plants the enormous quantity of valuable combustible matter present in the ashes and clinker discharged from the fires is a source of waste seldom fully realised. In the ashes removed from boiler furnaces the proportion of combustible sometimes approaches 20 per cent., equivalent to a loss of some 3 to 5 per cent. of the original fuel. Obviously here is a direction in which a definite contribution to the conservation of fuel can be made. For the recovery of fuel from ash, two systems have been developed in Europe: (1) Physical; (2) electrical. In Britain attention has been paid chiefly to the physical methods of recovery, while in other countries considerable progress has been made with other methods. These processes make use of the fact that when two solids, the one heavy and the other light, are mixed, their separation may be effected by immersion in water, when the heavier will sink more rapidly than the lighter; or, if one substance be lighter than water, then this will float on the surface, while the heavier will sink to the bottom. Coke is heavier than water, but, owing to its porosity, its apparent specific gravity is nearly identical with that of water, with the result that until it becomes saturated it sinks very slowly.

Regarding the specific gravities of the substances in the mixture, considerable variation is found, but the average of a number of tests shows the following:—Clinker 2.05, shale 2.50, and coke 1.25.

In each of these separating methods the breeze is screened out from the material before it is passed on to the separating apparatus proper.

The systems usually employed in Britain operate on the flotation principle. One of these is the froth-flotation method. The principle of operation here is as follows: When certain reagents are added in small quantities to water, and the whole is agitated violently, a large number of minute air bubbles is formed. On allowing the liquid to stand, the bubbles do not coalesce, but remain separated from each other and rise slowly to the surface, where a more or less permanent froth is formed. The reagents which may be used for this purpose are many and various, and include certain oils such as turpentine, soluble organic substances such as creosol, certain alcohols like amylalcohol, and sund soaps. The proportion of the reagent to the mater treated is small, amounting in most cases to a fracti of a pound of the reagent to a ton of water.

If solid particles are suspended in the water, th may or may not become attached to the bubbl If they do become attached, on allowing the liquid stand, the bubbles rise to the surface and form an e tremely stable froth, by which the solid particles a supported. Particles of coal can readily be floated this method, while, on the other hand, ash and eart substances will not be floated. It follows then that co may be separated from its incombustible constituen This froth-flotation method has already demonstrated i efficiency as a separator of combustibles and inco bustibles.

In the Waller washer, water is oscillated by co pressed air, and a screen plate upon which the m terial is deposited is also oscillated by eccentrics fro which the plate is suspended, so arranged that, wi the downward motion of the plate, the water is forc upwards through the bed of coke and ash. This acti separates the coke from the waste, the coke being carri forward by the stream of water, while the clinker ar ash remain on the screen plate and fall through t holes to the bottom of the tank.

The Blackett washer, as will be seen from fig. 1, co sists of a cylinder to the interior periphery of which

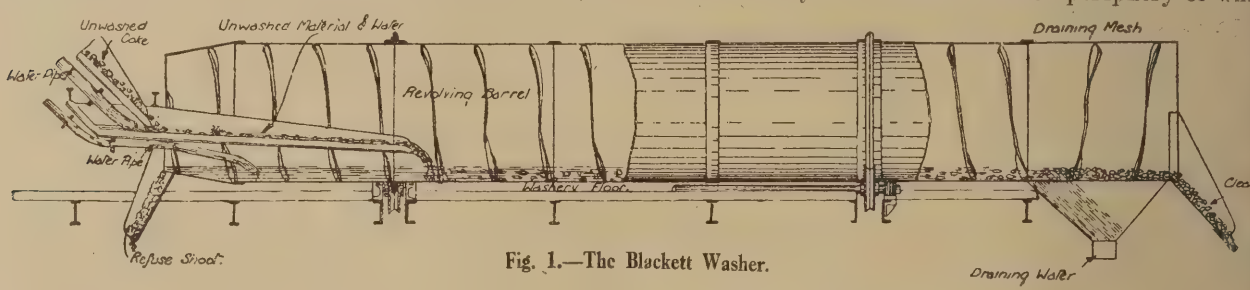

Fig. 1.—The Blackett Washer.

attached a coil made in the form of an Archimedea screw. The cylinder is at a slight incline, the inl being at the higher end, and rotates at a speed of abou nine r.p.m. The screw is arranged to operate in opp sition to the incline, so that a heavy material lik clinker, thrown in at either end, is taken up by th screw and discharged at the higher end. When th Blackett machine is operating, the cylinder is rotate by friction gear, while at the same time a stream water is injected at the upper end. The water, flow ing over each successive weir formed by the screw, run away at the lower end. The coke floats on the surfac of the water, flows over the weirs, and is discharged the lower end of the cylinder. The heavy clinker sink to the bottom and is conveyed by the screw to the highe end of the cylinder, where it also is discharged. In thi way clinker and coke, or shale and coke, are separated

A study of fig. 2 will readily assist engineers to com prehend the simple principle upon which the Columbu separator operates. The machine consists essentially o two main sections: a revolving drum sieve, into whic the waste material is fed, either by hand in small ma chines or by a continuous conveyor in the larger types and the separator proper. The process is briefly as fol lows: The material is passed through a revolving small mesh sieve drum, which rejects the fine dust, and throug a revolving large-mesh grid, which ejects any occasiona oversize lumps of slag, the elimination of which experi ence has proved to be desirable, as they consist mainl of pure slag of no calorific value. From the grid th material drops into the separator chamber, consisting o an inclined sheet-iron container within which revolves

separate chambers, two superimposed conveyor orms. The container is half-full of water, the specific ravity of which has been increased to about 25 deg. 30 deg. Beaumé, by any of the numerous means adily available, such as, for instance, by admixture of ommon clay, loam, chalk, carbide-slime, salt-lye, or any milar suitable substance. Upon falling into this liquid e heavy slag immediately sinks to the bottom, while

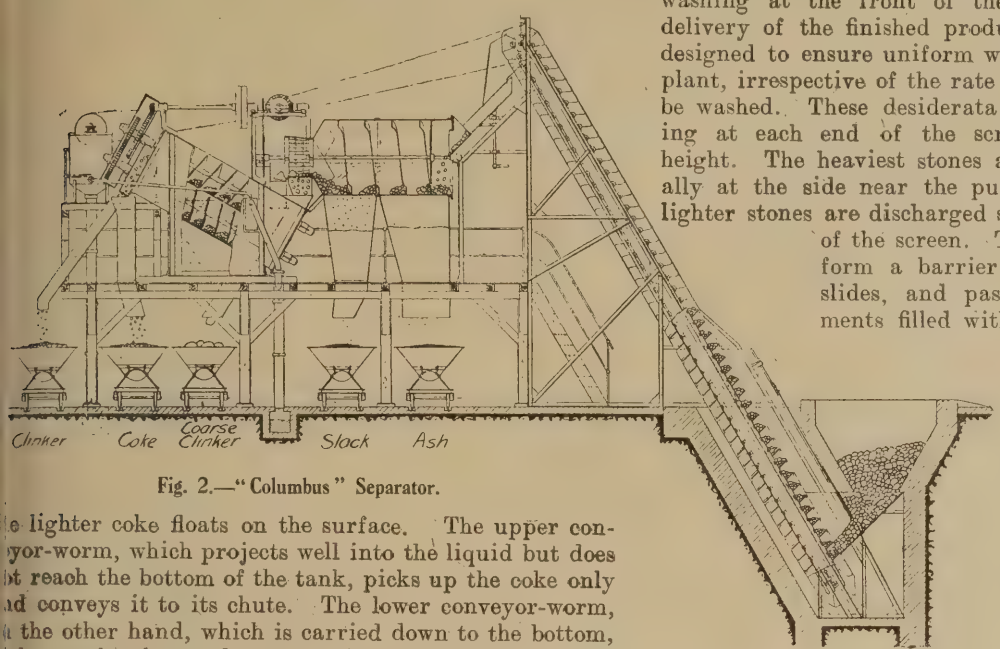

Fig. 2.—"Columbus" Separator.

e lighter coke floats on the surface. The upper conyor-worm, which projects well into the liquid but does ot reach the bottom of the tank, picks up the coke only nd conveys it to its chute. The lower conveyor-worm, n the other hand, which is carried down to the bottom, cks up the slag and stones only, and passes them out rough a separate chute. Tip wagons, into which the parated coke and slag fall, are usually placed directly nderneath these chutes. Large installations are generly arranged to feed the separated materials into railay wagons or into bunkers either directly by mounting e apparatus on a raised platform or by means of conyors.

The separator requires very little power, *i.e.*, from to 4 h.p., according to size and output. The water nsumption is only about 20-50 gallons per hour, and most any waste water, fresh or salt, can be used. Both e coke and the slag are immediately available for use; e coke, having become only superficially moistened, n at once be re-fed into the furnace. The slag is freently used for the manufacture of slag-bricks, after ing crushed and mixed with a small proportion of nd and cement. These bricks are easy to make, inpensive and, requiring no firing, can be prepared on e actual site on which they are required. One unilled labourer only is required to attend the machine, en for the largest type. In big installations additional labour is, however, required to transport the marial to and from the machine, or elevators and conyors can be arranged for this purpose. The smaller pes can be mounted on a trolley, so that they may be oved from place to place or up to the existing slag

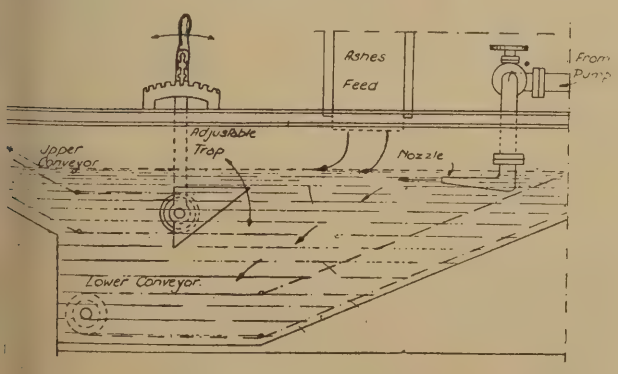

Fig. 3.—Water Separator.

ap. The standard machine is supplied with an overad shaft fitted with fast and loose pulleys for belt-drive om any convenient shafting. When required, an indendent drive by a small electric motor or petrol engine, ted inside the base of the machine, is arranged for. In this case a small counter-shaft is fitted to a bracket on the side of the machine.

A separator recently developed in Belgium is of the pulsating piston type, in which a single screen is spaced away from both the front and rear walls of the body of the washer; and its object is to introduce into these washers improvements, for the purpose of securing the regular discharge of the lighter pieces or stones (for re-washing at the front of the screen, and a regular delivery of the finished products. The washer is also designed to ensure uniform working and output of the plant, irrespective of the rate of feed of the material to be washed. These desiderata are obtained by providing at each end of the screen a slide of adjustable height. The heaviest stones are discharged automatically at the side near the pulsating plunger; and the lighter stones are discharged similarly at the other side of the screen. These two classes of stones form a barrier in front of each of the slides, and pass into separate compartments filled with water to the same level as that of the water in the screen compartment, so that the washer will never run dry. The finished material is discharged over the barrier of lighter stones. The heavy stones (final stones) being thus discharged on entering the washer, the following conditions are established for the latter: A more homogeneous washing bed, a more uniform water-stroke, and an improved yield.

Since the slides extend across the full width of the washer, there is no longer a risk of the washer becoming obstructed by the presence of a foreign body. The screenings, *i.e.*, the material passing through the screen, are discharged at the bottom of the washer by way of a pipe connection. The lightest stones (for re-washing) are discharged at the front end of the screen by means

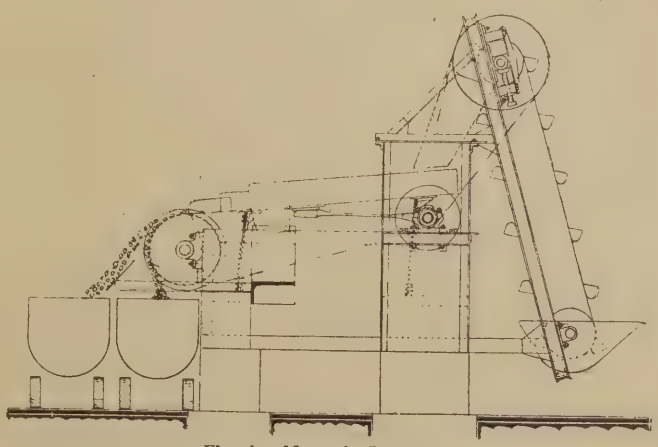

Fig. 4.—Magnetic Separator.

of a slide, identical with that at the rear end, and by a pipe and a bucket elevator. Since the products are discharged into separate compartments, also filled with water to the same level, the washer cannot be emptied of water as in the case of certain other washers.

An interesting German method is that in which the water bath is kept under pressure and in constant motion. The feature of the process is the addition to the water bath of some sand mixed with cement. The porous coke absorbs a little of this mixture, but the coarser pores of the clinker fill up completely with the sand-cement mass, their weight being in consequence considerably increased. The separation of clinker and coke is then readily accomplished by deposition or centrifuging.

An apparatus recently introduced is illustrated in fig. 3, from which the principle will be easily understood. The separation of the combustible matter from

ashes and clinker takes place directly upon the surface of the water before the coke has had time to absorb the latter. This result is obtained by producing upon the water a surface current which draws the lighter material along with it and permits the heavier material to sink, the curves of movement of the two materials being widely separated. The separation is facilitated by a trap, which is mounted horizontally in the current produced by the nozzle-injector, the coke or the other light material falling from the trap upon an upper band-conveyor, while the clinker and heavier material fall upon a lower band-conveyor.

The magnetic process, developed largely in Germany, operates on the principle that all kinds of coal incorporate iron in the form of pyrites. Pyrites has no magnetic properties, but when the coal is burnt, the pyrites is converted into oxides of iron, which are magnetic. Thus in the burnt fuel the combustibles are non-magnetic, and the non-combustible are magnetic. In the Krupp magnetic process the ash is fed on to a brass drum rotating about a horizontal axis, and is exposed to the action of a stationary magnetic field, the strength of which increases from the top of the drum downwards afterwards decreasing to its least strength in the lower section of the drum (see fig. 4). The screened ashes are fed on to the periphery of the drum, so that the ash constituents containing the iron are held magnetically to the surface for a portion of a revolution, and then fall off into a separate receptable as they pass out of the magnetic field. The coal or coke does not adhere to the drum, but leaves its surface directly after contact with it, and is projected into its own receptacle. It is claimed that lumps of ash and clinker up to 3 in. mesh will adhere to the drum and be removed. The energy required varies from 0.6 to 2.4 kW-hours per ton of ashes treated.

An advantage of the electromagnetic process is the fact that all the combustible matter is recovered in the dry state; thus its value as a fuel is not impaired by a heavy percentage of water.

Rural Electricity Supply in France.

Some Examples of Overhead Line Construction.

By THEODORE RICH.

In France rapid progress is being made with the supply of electricity in rural areas; the demand for labour in some districts seems to exceed the supply, and farmers are beginning to look to electricity to help them to make good the deficiency. The regulations have been framed to aid, not to obstruct, and telephone crossings by pin-insulator lines do not cost £250 each there; if they did, there would be very few roadside lines in existence. It should be remembered that there are thousands of miles of rural lines in districts supplied from steam-power stations.

A poster, reproduced at the end of this article, issued by a firm of contractors in Paris, with a capital of six million francs, which specialises in the erection of lines, transformer posts, and gear generally in rural districts, is of interest as showing that electricity supply under such conditions is no mere fad or passing craze, but a commercial proposition. In the poster can be seen a farmer saying to himself: "Well! We can now get the labour we want by wire." He stands alongside a transformer post, from which a low-pressure line, on wooden poles, devoid of money-wasting so-called safety gadgets, runs to the village near by. In the distance is to be seen an electrically-driven thrashing machine at work.

In order to show that the poster is not merely some of the advertising eyewash so much in vogue to-day, photographs are reproduced of work done by the firm that issues this poster. Fig. 1 shows light steel posts crossing a ploughed field at 15,000 volts, in the departments of Charente and Dordogne. Fig. 2 shows a 15,000-V line alongside the high road in the department of La Vendée. This line has the "Cornez" type of galvanised steel bracket; the bracket is to some extent flexible so as to equalise the strain. If one remembers aright, this class of bracket is made by Messrs. Jacquemard, of La Ricamarie on the Loire, a firm that specialises in the manufacture of standardised steel brackets and ironwork generally for pin-insulator lines. A span of 40 metres is very usual for wooden pole lines; the conductor is often kept high to allow for trees and bushes. There must be several thousand miles of power lines alongside French roads, yet it is only on exceedingly rare occasions that one hears of accidents to members of the public through their existence.

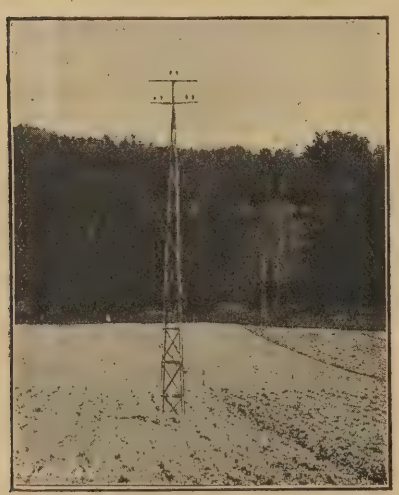

Fig. 1.—15,000-V Steel Pole Line.

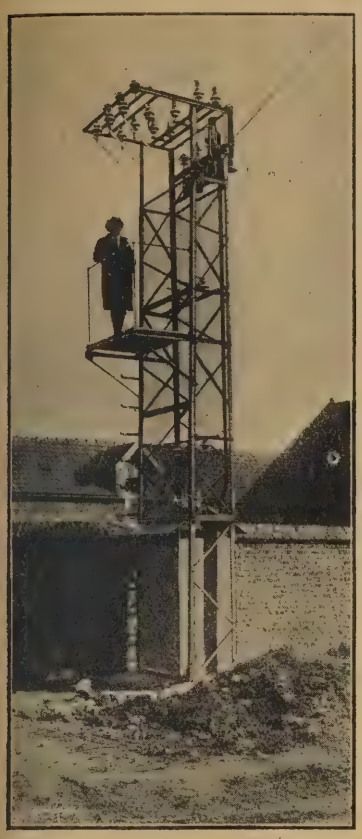
Fig. 2.—15,000-V Roadside Line.



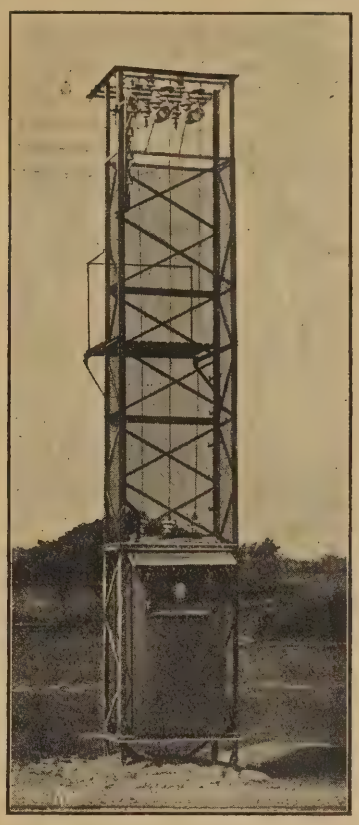


Fig. 3.—15,000-V Concrete Post Line.

Fig. 3 shows a 15,000-volt line with lightened-out concrete poles. These are usually made at some convenient depôt, so far as is possible where suitable aggregate is obtainable, and then shipped to the site, when hard, on motor lorries equipped with trailers arranged like timber or rails on a railway truck.

Some contractors for armoured concrete poles use rapid-setting cement so that the same moulds can be used over and over again without delay. In some cases the bases for concrete poles have been cast round a mould, so that, when hard, the pole itself can be dropped into the socket, wedged up and grouted, a job that only takes a few minutes. Owing to the weight it is, of course, much more easy to get concrete poles on to the site alongside a road than across ploughed fields.

The brackets are of the herring-bone Cornez type, of galvanised steel, and the three phase wires are arranged symmetrically. By this means, should it prove desirable, the phases can be easily transposed to neutralise any inductive effect on neighbouring telegraph and telephone lines. In fig. 3 a telephone line can be seen on the right-hand side of the road. Judging by the miles and miles of road where power lines are to be seen on one side of a road, and post office lines on the other, these administrations seem to rub along together somehow.

Figs. 4 & 5.—Steel Transformer Posts.

Fig. 6.—Transformer Posts.

It is interesting that there is no earth wire on many lines in France. In some districts it is found desirable, in other districts not; but it is usual to have them on lines of genuinely extra-high-pressure, say, 45,000 volts and upwards. In the U.S.A. it still seems to be a moot question regarding lowish pressure lines. Our Board of Trade, in times past, with its vast experience, knew more about the matter than the rest of the world combined, and insisted on an earth wire.

Fig. 8 shows a railway crossing with steel supports, at 15,000 volts. As a rule for these, doubled insulators and doubled conductors are used, and, where possible, a reduced span. Earthing guards can be seen on the near side, to earth a conductor if it breaks. French railway companies have found that it is futile to put up over their telegraph, telephone, and signal control wires elaborate guarding arrangements which so often, when loaded with snow in a gale, have a lower factor of safety than the conductor they are supposed to catch if broken. The Post Office officials in France have apparently also learned the same lesson. Only in very rare instances are telephone or telegraph wires put underground at crossings, and yet the French post office engineers have far more experience in such matters than their English *confrères*.

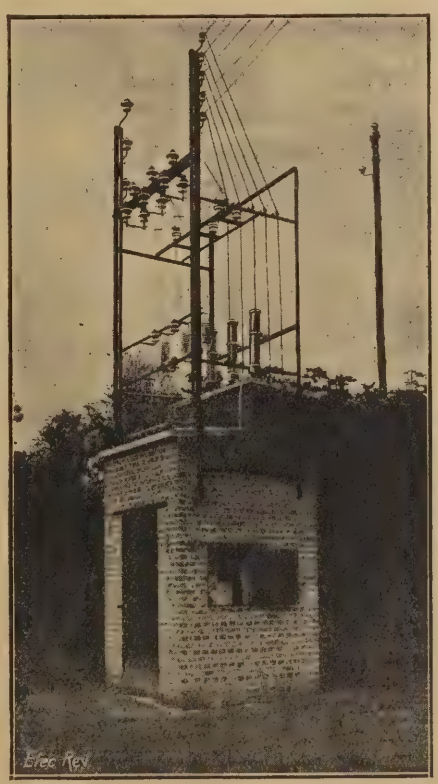

Fig. 7.—Transformer Cabin.

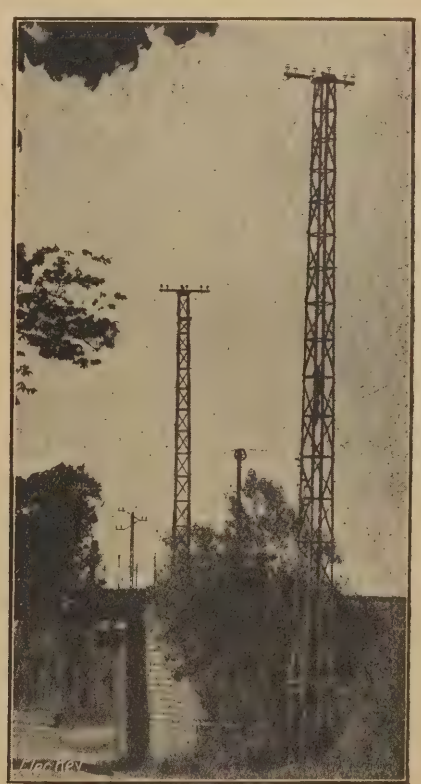

Fig. 8.—Railway Crossing.

Transformer Posts.

An angle-steel transformer post, 15,000/220/380 volts, is shown in fig. 4, of a type suitable for villages. The transformer is in the cabin below. The three pots seen on the top of the frame are the water and glycerine resistances in series with the horn arresters. After opening a low-pressure switch accessible through the little door below, leaving nothing circulating but the magnetising current, the high-pressure links can be opened in safety. In fig. 5 is seen a somewhat similar

post without dischargers, but with links, choking coils, and transformer below as before. Concrete is filled in round the base. The making of such steel cabins has become quite a business.

Fig. 9.—A French Poster.

A transformer post with a brickwork cabin is shown in fig. 7 for 15,000/220/380 volts. This class of construction is useful where transformers of 25 to 50 kW are used. Through the open shutter an l.p. meter can be seen. It is possible to arrange for some local handy man to keep the keys of this low-voltage side, so that a fuse could be replaced or even the low-pressure supply cut off pending the arrival of a skilled operative.

A farm transformer post for 15,000/110/190 volts is shown in fig. 6, quite simple and effective.

In France during the last 18 months for some of the more scattered villages a low-pressure network of 200/300 volts, in lieu of the usual 110/190 volts, has been developed, care being taken to have a higher class of low-voltage wiring in the houses to suit the case. The engineers of the different rural authorities have not, apparently, opposed the development.

15,000 Volts as Rural Pressure.

There is an idea prevalent that something like 3,300 volts (following perhaps the old American 2,200-volt system) is a desirable voltage for rural distribution. In wind-swept Flanders 15,000 volts has been in use since before the war. The extra cost per mile of line for insulators is very small; there is but little difference in the cost of transformers and switchgear, and with 15,000 volts, as the capacity for the same percentage drop is as the square of the voltage, about 20 times as much power can be carried as with 3,000 volts. In the North of France, to supply some farms and hamlets, iron wire has been used in some places at this voltage, with two wires single-phase off three-phase mains pending the development of the load. The writer is greatly indebted to the manager of the French company L'Electrification Industrielle for the above photographs of pole lines and transformer posts, and for permission to reproduce its interesting poster.

Modern Electric Cookers.

A Review of the Recent Improvements in Electric Cooking Stoves.

(*Continued from page* 767.)

Probably the most interesting departure from the usual construction of the electric cooking stove is found in the introduction of the table cooker. It is said that in the United States the electric table cooker is an even more popular item in the culinary equipment of the household than is the gas ring in Great Britain. The low oven to which the cook has to stoop each time she gives it her attention still predominates in this country, probably because the available space and the general structure in the majority of houses will not, on the whole, permit of another design. Our attention has been drawn to several designs of this type of cooker; we illustrated the No. 42 "Jackson" table cooking stove in our issue of April 24th last. In this model, it may be recalled, the makers have mounted the oven and hob of one of their ordinary cookers side by side upon a steel table, a ledge underneath the table affording convenient storage for cooking utensils, &c. This apparatus represents fairly the general trend in such introductions. Fig. 4 shows a particularly interesting design. It is a kitchen outfit manufactured by the Arora Company, and consists of an oven mounted on a 13-in. metal stand; beside this combination are three boiling plates and a grill mounted on a sheet-metal table at a suitable height. The whole suggests a very convenient equipment for cooking operations. Fig. 5 shows an "Xcel" cooking range constructed on the same principle, which incorporates another advantage in this type of cooker, in that it permits the provision of a hot cupboard over the oven in the usual position of the hob plate, and so utilises any heat rising from the oven which would otherwise be wasted. The table cooking feature has also been introduced into the "Universal" range of Messrs. L. G. Hawkins & Co., Ltd. This is a

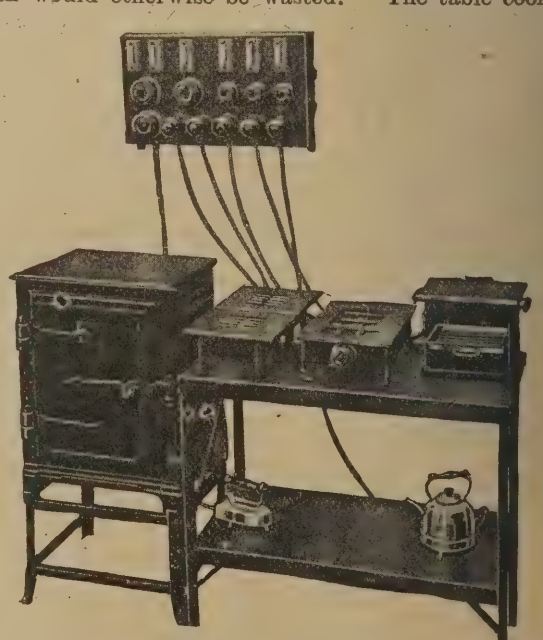

Fig. 4.—Table Cooking Outfit.

very effective and attractive oven and boiler combination, equipped with a damper, aluminium broiler pan and nickel plated wire racks. The total maximum wattage is 6,500 W, and the floor space dimensions are 27 by 43½ in. The crated weight is 320 lb.

Without a doubt the greatest strides made in the improvement of electric cookers have been in connection with the construction of the heating elements and

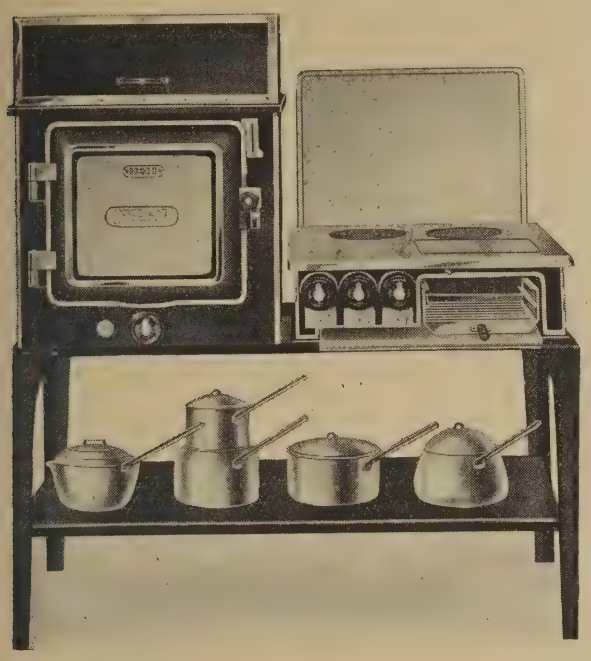

Fig. 5.—Typical Table Cooker.

in the methods adopted for their housing. The weakest point of any cooker at the present time is admittedly the boiling ring, and it is here that most of the difference of opinion as to the best construction lies. A 40 per cent. efficiency boiling plate represents a good standard. The boiling plates now generally adopted are the outcome of either or both of two schools of thought. One represents the enclosed boiling ring in which the elements are entirely covered as a protection against spilt liquids, &c.; the other represents the open type, which has the advantage that radiant heat is transmitted direct from the elements to the cooking receptacle, but also the disadvantage that the elements are exposed to the liquors, &c., which, it seems inevitable, boil over from time to time. Much is to be said

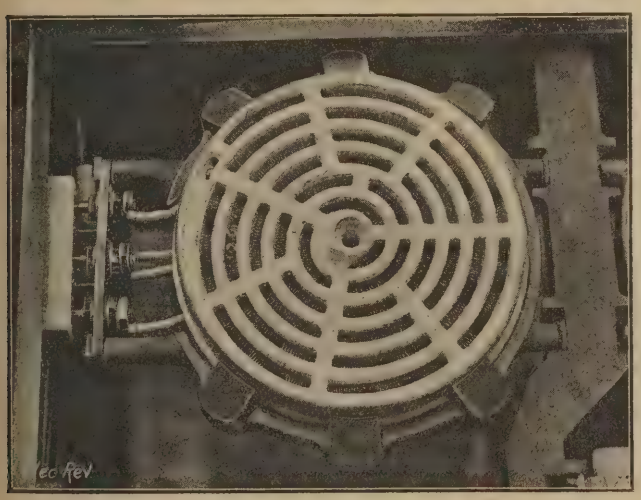

Fig. 6.—Open Plate.

for and against each case. In the enclosed type, of course, some heat is sacrificed for the sake of protection to the elements. One pattern favours efficiency as far as consumption is concerned, while in the other case the main attention is given to the question of efficiency in the direction of maintenance. Which gives the higher combined or total efficiency has probably yet to be proved. Another deciding factor is the consideration of the rate at which the boiling temperature is reached at the vital parts of the plate. It appears to be necessary to sacrifice to some degree the efficiency as regards rapid boiling time in favour of the constant temperature efficiency. The boiling plate of the "Xcel" cookers of the Automatic Telephone Manufacturing Co. is of the open type, the makers being desirous of obtaining the highest efficiency possible from the point of view of consumption. It consists of a fireclay circular slab 7 in. in diameter, with deep grooves retaining high-grade nickel-chrome spirals which are held in position by a special construction. The makers claim that

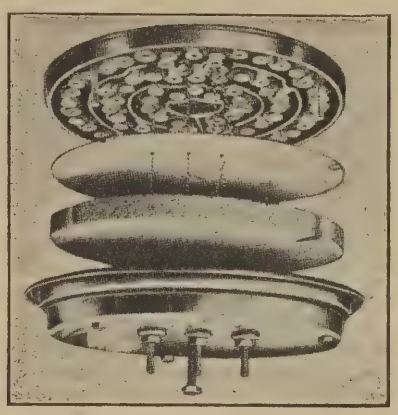

Fig. 7.—Fully-Protected Plate.

a considerable reduction of heat wastage results from the use of the circular plate. The slab is well perforated to provide for vessels boiling over, and is held in place by a novel cast-iron support provided with three plug-in terminals which engage with special sockets mounted on the side of the cooker; this is an important and interesting feature, it being desirous to have an element or element unit which can be easily replaced. As in several other well-known makes, the entire boiling plate is built in a frame so that it can be instantly removed for cleaning or repairing operations. The adjustment is simple, and the face of the

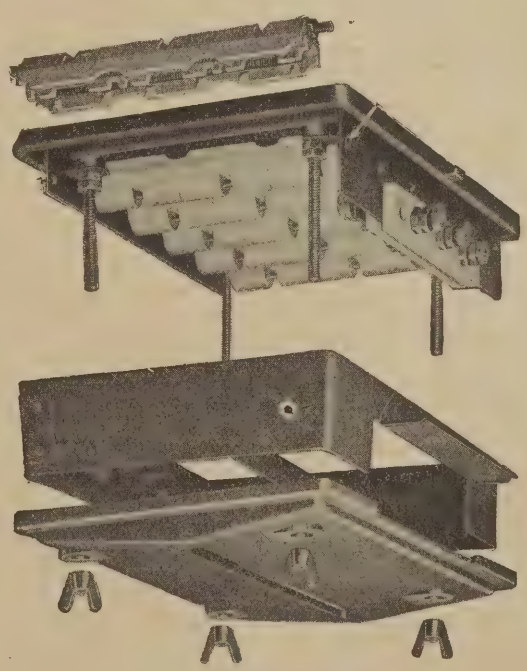

Fig. 8.—Semi-enclosed Plate.

plate is flush with the top of the hob plate. Fig. 6 shows the construction of the "Xcel" open plate. The average loading for the plates of this make is 1,500 W. In the "Universal" cookers, considerable improvement has been made on the enclosed type of boiling ring which, the makers claim, has resulted in a particularly efficient plate of that type. Fig. 7 illustrates the special construction of this boiler unit, which is claimed to prevent warping and cracking.

The element is wound on porcelain formers very near to the inner surface of the cast-iron protecting plate. An asbestos disk is placed immediately under the element, and beneath this is a thick insulating block. The steel casing underneath accommodates these, and the whole is clamped together by a central bolt. It seems that the Jackson Electric Stove Co., Ltd. has sought the happy mean with regard to the boiling plates on its latest cookers. The makers have adopted a semi-enclosed plate, which they claim carries the combined advantages of both the open and closed types. Radiant heat is distributed through slots in the top of the unit, while the elements are protected by bars or closed portions, immediately under which they are installed. Each boiling plate is arranged as a whole unit in an iron box, which can be lifted from the top of the hob complete. The box consists of the top slotted slab and the element container which is bolted to it by means of four bolts and wing nuts. The container holds six elements, two groups of three in series, in parallel. The element coils are wound on clay formers, and are so arranged that new coils can be easily wound. The formers are easily lifted out. The element connections are arranged by means of terminals attached to the inside of the frame or container. It is interesting to note that the complete boiling-plate units and also the separate elements in this design are interchangeable throughout 14 sizes of cookers with varying capacities for cooking for from 2 to 14 persons, also that the clay formers for the elements for all sizes are built up from standard sections upon which the individual element spirals are wound. Fig. 8 illustrates the construction of the "Jackson" plate, but we understand that this is about to be superseded by an improved one, also of the semi-enclosed pattern.

Metro-Vick Supplies, Ltd., is another firm which has adopted the semi-enclosed pattern of boiling plate. The coils are neatly and effectively protected from the unavoidable overflow of liquids, which have a free access through the plate on to the vitreous enamelled crown plate underneath. The protecting bars are of a special non-scaling and non-warping alloy. It is claimed that the watts rating per square inch can be raised to a very high figure ensuring a quick operation and a very high efficiency for this type of plate. The plate installed in the "Cosmos" cooker is made up as a separate circular unit, which is "slipped" into place in the hob plate, and it can be removed by simply lifting it out after disconnecting the leading-in wires. A simple adjusting arrangement is provided for regulating the level of the plates in relation to the hob. The boiling unit is made in two sizes, 8 in. and 6 in. in diameter, and the standard "Cosmos" cooker is provided with one of each size. Each is controlled by a 3-heat switch, for which the elements are suitably wired.

(To be continued.)

When Salesmen Sell the Business.

By A COST CONSULTANT.

There can be little need to emphasise the important place that the selling organisation now holds in modern industry. For many years the selling staff has always been large in certain trades, as, for instance, the garment industry, where the cost of selling is said to be greater than the cost of production, and it would now appear that in many other industries the staff required and the expenditure necessary in order to sell the product are steadily increasing. Very few goods now find their own market, or sell themselves, as it is said. The sales of everything have to be "pushed," either by attractive advertising, capable and persuasive salesmanship, or else by offering some inducement in the form of advantageous prices. When it is proposed to introduce some new article, either in competition with, or to save the expense of some article already on the market, its merit alone will avail its manufacturers little. They must perforce rely upon the skill and originality of their selling organisation to establish their innovation as a popular necessity. Innumerable articles in everyday use, which are regarded as indispensable to 20th Century civilisation would never be used at all had it not been for skilful advertising and selling in the first place; for who would now be without their fountain pen, their safety razor, their Fairisle jumper, or even their wireless?

It is this third weapon of the salesman that it is proposed to discuss in this article, namely, some inducement in the form of advantageous prices. There was a time when prices could be definitely fixed by the manufacturers at their own offices, and their products could only be bought at those prices. This has now become impossible in a large number of cases, and the final fixing of the price has often to be entrusted to the selling staff, with the result that the increased activities of the salesmen have been accompanied by increased responsibilities. It is, however, open to question whether the abuses to which this plant is subject are always guarded against as carefully as is necessary.

The principal charge of the sales staff is, of course, Turnover. It rests almost entirely in their hands to obtain orders for the firm. The whole livelihood of the sales staff depends on turnover, for their commission is based on it; but so does the prosperity of the whole firm, for without an adequate turnover, that is, without sufficient orders, of what avail are the men and machines in the factory? No wonder the entire sales staff, from the sales manager down to the youngest traveller, think and dream of little else but turnover, and regard it as the be-all and end-all of business. No wonder they are inclined to believe that nothing else but turnover really matters very much, and that everything should be sacrificed to attain that end. Some sales managers, in whose charge the final settling of the contract price now rests, are known to contend that even the price must be subservient to turnover. In fact, such is the point of view and the result of the whole training of a salesman, that he is unable to regard any of his responsibilities as greater than, or even as great as, that of obtaining an increased turnover.

Having regard to this outlook on business, it would appear doubtful whether it is wise to give the sales staff too free a hand as regards the price, without taking ample precautions. These are times when many businesses, particularly in the iron and steel trade, openly admit that they are bound to accept work "below the cost of production" in order to keep their staff and workmen together. It must, therefore, frequently be the experience of salesmen acting for firms in this trade to negotiate for work, and sometimes offer reductions without having an opportunity of referring to their head office, and finally to accept work at these reduced prices, even though they know that the firm's original quotation was already below the cost of production. It may at first sight appear strange that any firm can go on accepting orders and carrying out contracts at prices below the cost of production, without either dipping into its reserves, or else heading for the bankruptcy court. Nevertheless, it is being done quite regularly, and it is interesting to examine how such a course can be possible. The explanation is simply this. Every firm has certain establishment charges to meet. They may either be spread over a few orders at a high price, or else absorbed by a larger number of orders at a lower price, and it is the latter alternative which is the only possible one for some firms at the present time.

The broad connection between price and turnover made use of in this explanation is well known and understood, even by salesmen, and it sounds quite simple until it becomes necessary to examine it more closely and to attempt to express in figures the exact price level that corresponds to each rate of turnover. It is profitable to delve beneath the surface and try to find out what this relation is.

It stands to reason, in the first place, that if the price obtained for an order does not recompense the manufacturer for the material he has to buy for the purpose, he will do better to refuse the order. If it does not also pay the wages of the men he has to employ to carry it through, the same remark applies. Besides this the price must also make some contribution towards the establishment charges of the firm, but how much, in order that the order may be worth booking, is not so obvious.

An examination of the items of establishment charges will show that they are divisible into two groups. There is one group including the rent, rates, taxes of the factory, the salaries of the engineers and designers, the works manager's and the foremen's salaries, the cost of keeping the buildings in good repair, and a number of other items which have to be paid for in order to keep the factory in a fit state to accept work. But they will vary very little whether the business has one or a hundred orders in progress. These are known as standing charges. Then there is a group of expenses, such as power, light, small tools, grease, oil, repairs to machines, health and unemployment insurance, the new pensions' scheme, storekeeping, and so on. None of these are incurred until and unless work is being done in the shops. They are known as running expenses.

The running expenses are actually out-of-pocket expenses, in exactly the same way as the material and the wages, so that if the price will not also cover the running expenses, the order is better left alone. But the standing charges have to be paid by the manufacturer whether any orders are obtained or not. The fact that the shops must be ready to carry out orders as soon as received necessitates these expenses, and any contribution towards them will be better, from the manufacturer's point of view, than having to pay them himself.

Any order, therefore, at a price which covers material, wages, and running charges, and contributes something towards standing charges, is better than no order at all. This critical figure at which it begins to be worth a manufacturer's while to book orders is always extremely difficult to estimate accurately, and quite impossible without accurate and reliable costs. At the same time, it does seem most desirable that this critical figure should be worked out, especially for contracts which it is known beforehand are not likely to be let, except at a figure below the cost of production. It would also seem desirable that a salesman, if he has authority to cut prices, should be told this critical figure, as well as the price estimated and quoted by his firm.

Admittedly this is a difficult figure to calculate, and one which cannot be calculated at all without a thorough knowledge of accurate costs, but these are times when orders are difficult to obtain, and in certain trades impossible to book except at figures approaching this critical level, below which it can pay no firm to go. It is, therefore, not only a wise precaution, but a necessity for every manufacturer to provide himself with a method of working out his costs, capable of arriving at this critical figure with a degree of accuracy that can be relied upon.

Only this week one hears of a certain contract for cast-iron pipes, which a well-organised and up-to-date firm calculated could be made for 26s. per cwt., being the total cost of production, and 18s. per cwt. as the bed-rock figure below which it would be better without the order. The order was refused to this firm at 18s. per cwt., because its price was much too high!

Examples such as this, of which many can be cited, make it difficult to believe that firms really know their costs of production accurately, or even realise that there is a limiting figure below which it cannot pay them under any circumstances to cut their prices further. Is the reason of this wild price-cutting (for it is nothing else) simply that salesmen are given too free a hand as regards the price, with the result that they sometimes cut below the economic limit without knowing it, or is it the more serious possibility, that many manufacturers do not know where this limit lies?

In trades where prices below the cost of production are so frequently quoted that they are the rule rather than the exception, too much attention cannot be paid to the calculation of accurate costs (or if it is new work, to estimates based upon accurate costs) so as to be able to find this economic limit. In such circumstances, too, the anxiety of salesmen to increase turnover must be curbed. They should be informed what this limit is, on every contract where there is a possibility of their having to offer a lower price, and warned never to offer or accept a price which is below the economic limit.

Shop-Window Lighting.

Scientific versus Haphazard Methods.

By A. V. HYDE.

The factor that will influence business even more greatly in the future than it has done in the past is the proper illumination of the shop-window. There is a great deal of work to be done by the trade in this important division of lighting. The direct influence for good of scientific illumination upon turnover was proved long ago, and there is not a retailer in any of the variety of trades where goods are sold over the counter, who, if he would keep abreast of competition and see a constantly expanding business, can afford for a moment to ignore the question of correct and adequate light in the window. The average shop-keeper in other trades will dress his window—well, ill, or indifferently—and, after a fashion, light his window also. But, unless he has the benefit of expert advice, the installation will perform only a fraction of its true function—which is to sell the goods—and will fall far short of what it might have been. He must be convinced of the value of light in the window, before he is actually sold an installation.

The field for the further development of creative shop-window lighting is so great and so important from the point of view of revenue to the electrical trade, that the dealer and the contractor must decide upon some way of approach to the individual, rather than wait for the buyer to come to them.

Just as the private buyer will not be interested in the technical description of an electric fire, or an electric cooker, until he is persuaded of the *need* for it, it is not the description of a system of shop-window lighting that the shopkeeper wants so much as in the first place a conviction of its benefits. The rest will follow in due course, for the arguments that can be adduced in favour of modern ideals in window lighting cannot fail to impress any reasonably-minded and progressive retailer. It may be clarifying to see what these arguments are, and to have them at hand for use at any time. Let us call them "The case for more and better shop-window illumination," and list them as follows:—

1. Light is a never-failing source of attraction: to the public it is as the candle to the moth.

2. After sunset one of the favourite pastimes of the public is to "go and look at the shops."

3. People buy where the light is bright.

4. Anything bright is always cheering and stimulating; a well-lighted window puts the passer-by in a cheerful frame of mind. He is then receptive to suggestion and impression. He is in the mood to feel the "desire to possess"; that is a sale half-made.

5. Light, in that it draws the crowds to the window, and a percentage of the crowds inside, is a salesman.

6. It is a salesman that knows no regular hours of working. It will work from dusk to bedtime, and any time during the daylight hours that it is required, for the cost of the energy consumed. It is a silent salesman

Fig. 1.—A typical Shop-window Reflector.

that is worth ten extra ordinary salesmen inside, because it appeals to potential buyers in the place where they are most numerous—in the street.

7. It will work hours after the business is closed—the days when the business of the day had to cease when the shutters were put up are past, thanks to the boon of scientific window illumination. It is in the power of efficient window lighting to make subtle impressions for the morrow.

8. The public, because of the attraction of a centre of bright light to the individual, tends to memorise windows which have attracted it, and to look for the same windows again. Thus light creates goodwill and builds for the future.

9. Correct and sufficient light on the goods adds attractiveness and value to even the best-dressed window. It gives an impression of cleanliness, neatness, and enterprise, to the least discriminating shopper.

10. Window lighting is every whit as much salesmanship as window dressing. Be the selling effort ever so intense, it falls short of maximum productivity if it ignores the potentialities of the window as a creator of business.

11. The finest advertisement for efficient shop-window lighting and the best proof of all the claims made for it, is the use that is made of it by all the leading retail departmental stores, and by hundreds of retailers in various parts of the country. The best salesman for light is light itself.

Present-day shop-window lighting is based partly upon the avoidance of glare, the hiding of the light source, and the concentration of a maximum amount of light diffused upon the display. When the light source is visible, the eye is distracted from the main object and much of the value is lost.

One system of shop-window lighting that has been very widely installed is the "Gecoray" system, which has the reflector principle as a basis. The source of the light is hidden from exterior view by what is known as "top-lighting," by the installation of specially-designed reflectors (fig. 1), hidden by a valance or "pelmet," and placed in the front of the window ceiling. This system provides for the illumination of every size of shop-window—the small, the average, and the high and shallow window. The lamps for which each reflector is designed vary in power according to the space to be illuminated. The system can be adapted to any existing structural contour or type of window decoration, and to cover any area. It is installed quickly and easily, and brings no dislocation of business in the process of installation. It is economical to install and maintain. It includes, as part of the complete system, spotlights for throwing a concentrated beam of light upon any special feature in the window display, and floodlights for the floodlighting of an entire display. Coloured light in the window is in every way the equal of spotlighting and floodlighting; in some cases it may have greater value. Colour lighting has been proved to attract even larger crowds to a display than when ordinary methods of illumination are used. A colour screen equipment is included in this system, red, orange, green, and blue screens being provided for the reflector. A typical example of the use of the system is illustrated in fig. 2.

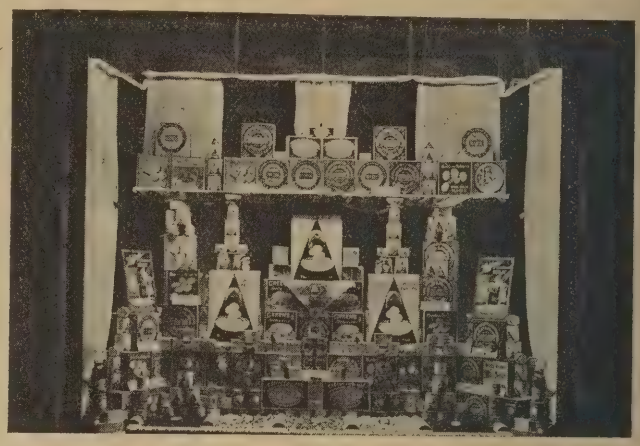

Fig. 2.—An Example of good Window Lighting.

With this description of a popular system, the reader will have received, we hope, some idea of the elements of scientific shop-window illumination, as it is in use to-day, and be in a position to pass over such information to the prospect who comes to him, or whom he himself approaches.

The importance of the trade helping itself towards obtaining the business that is to be done in this branch of more and better lighting is second only to the necessity for a full all-round appreciation of the great opportunities that exist. The fact that they do exist is all to the good of the electrical industry, and it is in the power of one and all to share in the business thus presented.

An Italian Peat-Operated Power Station.—In view of the high cost of coal in Italy, owing to the fact that this fuel has to be imported, much attention has within the past few years been devoted to methods of utilising the deposits of peat which abound in certain parts of the country, for the generation of electrical energy. One of the most recent and important installations of the kind is that which has been established at Torre del Lago, near Lucques, by the Società Torbiere d'Italia. From *Indurstria* we learn that the peat is treated in Mond-type gas producers, the gas being utilised for firing the boilers which supply steam for the turbo-generators. The peat is obtained from a deposit on the banks of Lake Massaciuccoli, where it is estimated that no fewer than 12 million tons are available. The peat, when extracted, contains as much as 85 per cent. of water; it is first allowed to dry in the open air until the humidity falls to about 35 per cent. The air-dried peat is then loaded into barges and transported to the gasification plant about 1¼ miles away. At present six gas producers are in operation, but a further two sets are being added. Each of the producers is capable of gasifying three tons of peat per hour under normal conditions, and four tons per hour when accelerated. When the whole eight sets are in operation it is expected that the plant will yield about 1,412,000 cu. ft. of gas per hour under normal conditions, and about 2,118,000 cu. ft. per hour when accelerated to meet the peak load demands. The gas is piped direct from the scrubbers to the eight Tosi vertical-tube boilers, no gas holder being employed as a measure of economy in installation cost. The electrical plant in which the gas is utilised will eventually consist of three sets of 5,000-kW turbo-generators producing 16⅔-period alternating current at 4,000 volts, 1,000 r.p.m. At present two generating sets are in operation, the output being utilised for traction purposes on the Spezzia-Pisa-Leghorn and Pisa-Florence electric railways. It is estimated that when fully completed the Torre del Lago installation will be able to supply 30 million kWh and produce by-products to the extent of 5,000 tons of tar and an equal quantity of sulphate of ammonia per year.

Electricity Supply in Great Britain.—VI.

Hampshire and the Isle of Wight.

No part of Hampshire has yet been included in an Electricity District, nor up to the present has the County been affected in any way by the Acts of Power Companies.

There are six Local Authorities owning electricity undertakings (excluding the Bournemouth Corporation, which is only authorised to supply for public purposes) and nine Company undertakers, whose areas of supply lie wholly or partly within the County.

COMPANIES.

Aldershot Gas, Water and District Lighting Co.
Andover & District Electricity Co., Ltd.
Bournemouth & Poole Electricity Supply Co., Ltd.
Gosport & Alverstoke Electric Lighting Co., Ltd.
Hindhead & District Electric Light Co., Ltd.
Lymington Electric Light & Power Co., Ltd.
Milford-on-Sea Electric Supply Co., Ltd.
Ringwood Electric Supply Co., Ltd.
York Town & Blackwater Gas Co.

Electricity Supply in the Counties of Hampshire and the Isle of Wight.

The following is the list:—

LOCAL AUTHORITIES.

Aldershot Corporation.
Basingstoke Corporation.
Fareham Urban District Council.
Portsmouth Corporation.
Southampton Corporation.
Winchester Corporation.

The number of units sold annually per head of population in any particular County is not always readily ascertainable, and the method to be used for estimating it is becoming somewhat complicated.

An undertaker who sells in bulk to another undertaker situated in a different County, as Portsmouth Corporation does to Chichester Corporation, is a typical example of the difficulty referred to above. The simplest way is to deduct the number of units sold in

bulk, which means in the case quoted that the County of Hampshire does not get any credit for supplying the energy (neglecting losses) bought by Chichester from Portsmouth.

Again, in the case of an undertaker like the York Town and Blackwater Gas Company, whose area of supply extends into Berkshire and Surrey, it would require a considerable amount of work to allocate the number of units sold per County (assuming that there are plenty of consumers all over the area in each of the three Counties), whilst the "kudos" for supplying the energy in this instance should really belong to the War Office. It should, however, be noted that the output of each of the undertakings owned by the Bournemouth and Poole Electricity Supply Co., Ltd., the Southampton Corporation, and the Portsmouth Corporation, respectively, is rapidly increasing.

With regard to the remaining undertakers, it has been estimated that the total number of units sold by these is less than half the total number of units used for traction at Bournemouth, Southampton and Portsmouth.

The map on the previous page is reproduced from the 1917 Boundary Commission map of Hampshire (by permission of the Controller of H.M. Stationery Office); a list of the topographical alterations since 1917 is added below to bring the map up to date.

The hatched parts which cover about one-third of the total area of Hampshire indicate that statutory powers for the supply of electricity are held or have been applied for in respect of them, leaving the remaining two-thirds of the county to be added to our list of "unoccupied areas." The 1921 Census gives the following particulars for the Administrative County of Hampshire and Associated County Boroughs:—

Acres.	Persons.	Resident families.	Buildings not containing dwellings.
958,896	910,252	206,274	11,220

(1) The Urban District of Aldershot has been created the Borough of Aldershot.

(2) The Urban District of Gosport and Alverstoke has been created the Borough of Gosport.

(3) In 1920 part of the Parish of Cosham was added to the Borough and Parish of Portsmouth.

(4) In 1921 the Parish of Cosham was re-named the Parish of Widley.

(5) The boundary between the Parishes of Headley and Grayshott has been altered.

(6) Part of the Parish of Hound has been transferred to the Parish of Hamble.

(7) The Urban District and Parish of Fleet have been enlarged by the inclusion of part of the Parish of Elvetham.

(8) and (9) The following were added to the Borough of Southampton in 1920:—The Urban District of Itchen, the Parish of Bitterne, and parts of the Parishes of North Stoneham and South Stoneham. The added parts of North Stoneham and South Stoneham Parishes were amalgamated to form the Parish of Saint Nicholas; and the part of South Stoneham not added to Southampton was merged into the Parish of West End. In April, 1925, the Parishes of Southampton, Itchen, Bitterne, and Saint Nicholas were united to form the new Parish of Southampton co-extensive with the County Borough.

Isle of Wight.

The 1921 Census gives the following particulars for the Administrative County of the Isle of Wight:—

Acres.	Persons.	Resident families.	Buildings not containing dwellings.
94,146	94,666	21,308	1,776

The Isle of Wight Electric Light and Power Co., Ltd., and the St. Helens (I.W.) Electric Lighting Co., Ltd., hold statutory powers in respect of all the Boroughs and Urban Districts and part of the Rural District. An application has been lodged by the Isle of Wight E.L. and P. Co., Ltd., to obtain statutory powers over the remaining part of the Rural District of the Isle of Wight, hence the whole of the County is shown hatched. In 1923 part of the Parish of Northwood was added to the Urban District and Parish of Cowes.

Radio Wave-Lengths.

Some Comments and Suggestions.

By W. MOON.

LISTENERS who live near the sea often find it difficult to hear a foreign station owing to ships signalling on the same wave-length as the station. It is therefore advisable to limit both ships and broadcasting stations to certain wave-lengths, or ranges of wave-lengths, so that neither of these forms of transmission shall interfere with the other.

Also in selecting wave-lengths for different stations it is advisable that none of them should be multiples by 3, 5, or 7 of those of other stations, so that harmonics of a near station shall not jam a more distant station.

Now that broadcasting has reached such proportions, it would be interesting to know to what percentage of selectivity the average listener can adjust his apparatus, and also what percentage of selectivity can be obtained as a practical proposition. While the apparatus of the average listener can perhaps select wave-lengths differing by 2 or 3 per cent. when they are of equal strengths, it is too often found that a near powerful station will jam a weak distant station when the difference between their wave-lengths is as much as 10 per cent.

When selecting the wave-length of a particular station reference should be made to a list in which the wave-lengths are arranged in geometrical proportion, so that the wave-lengths can be equally spaced as regards interference with each other.

If 1 to 10, or 10 to 100, or 100 to 1,000, and so on, be divided into 100 geometrical parts, each number will be 1.023293 times its predecessor. In the following list 1 to 10, &c., are divided into 100 geometrical parts, the decimal points being omitted. The numbers are given to four places of figures.

Referring to this list, it will be observed that, while there is duplication of stations on certain wave-lengths, there are other ranges of wave-lengths that are not used. But no doubt the committee now dealing with this matter will arrange to space out the stations evenly, so that there is the least possible clashing in wave-lengths between broadcasting stations; and also that a range of wave-lengths, say, 600 to 1,000 metres, shall be reserved for ships' signalling alone:—

Wavelengths in Geometrical Proportion to four places of figure.

The Electro-Deposition of Cadmium and its Alloys.

Some Notes on the Processes Employed and the Results obtained.

By E. W. LEWIS.

Metals are now deposited by electrolytic processes on a commercial scale, large quantities of metals being produced for the various industries. Electrolytic deposition processes are also employed for covering the more easily corroded metals with films of metals which offer greater resistance to atmospheric conditions and are of a more permanent character, suffering much less oxidation. Some of these processes have found extensive commercial application, cadmium electrolytic deposits being used as the outer resistant film, as it offers protection to iron and steel surfaces, the properties of the cadmium film being intermediate between the metals zinc and nickel. The high resistance of cadmium to chemical action, compared with zinc, renders it suitable where zinc fails or is unsatisfactory; wire and wire ropes are cadmium-coated for resisting sea-water activity and corrosion, also for coating battery terminals and connections for primary and secondary batteries. The field of the electrolytic deposition of cadmium shows promise of considerable expansion.

The electrolytic deposition of the metals follows Faraday's laws of chemical equivalents, the ampere-hour being associated with the electrolytic deposition of a definite maximum amount of metal, which is only realised under the optimum conditions. With an insoluble anode a definite minimum e.m.f. is required to maintain electrolysis. In the case of the electrolytic deposition of cadmium, it has been found that the best results are obtained when the amount of metal deposited per ampere-hour approaches the theoretical, the deposit being white, firmly adherent, finely crystalline, and withstanding burnishing. When the amount of metal falls much below the theoretical, hydrogen gas becomes occluded, and forms crevices in the deposit, leading to a loose and often powdery film and rendering the product unsuitable for commercial purposes. Defective deposition may also be due to excessive current, or to simultaneously deposited hydrogen due to a weak electrolyte or to the deposition of basic cadmium compounds. With an efficient anode solution and a good conducting electrolyte, a p.d. of about 0.4 to 0.6 volt, will maintain a fair rate of cadmium deposition. The electrolytic deposition of cadmium is readily carried out under the same conditions as in the case of zinc. The *Chemical Trade Journal*, August 1st, 1924, states that Borcher found that current densities of 80 to 100 amperes per square metre yielded a good and useful deposit of cadmium. In America, cadmium plating is now being introduced under the patent name "Udylite," and it is found to protect iron and steel against sea-water or atmospheric corrosion in a far superior manner to hot or cold galvanising.

Electrolytically deposited cadmium forms a highly efficient protective covering for aluminium, the difficulties due to the porosity of the commercial aluminium metal having now been overcome by the application of sand-blasting. The aluminium surface is initially sand-blasted, coated with a thin film of iron, again sand-blasted, and then placed in the cadmium bath consisting of either cadmium sulphate and potassium cyanide or cadmium ammonium sulphate and a small percentage of peptone; electrolysis is carried out at 25 deg. C., using cadmium cast anodes, and a current density of 5 to 7 amperes per square foot. The "burning" of cadmium deposits is considerably lessened by the presence of substances in the electrolyte, which exert a solvent action on the basic compounds of cadmium; colloidal substances such as glue or gelatine are highly effective in this respect. Cadmium deposits take well on all metals, no "strike" solutions or intermediate coats being essential; they are superior to those of zinc for many purposes, due to the cadmium being more resistant to chemical action than zinc. Cadmium-plated aluminium has been subjected to the very severe "salt spray" and "water line" tests, with highly satisfactory results; perhaps the only derogatory feature acting against cadmium-coated aluminium is its increased weight. Cadmium-coated steel is becoming of first-rate importance; it gives a hard and pleasing surface, the final heat treatment causing the two metals to form an alloy on the surface. In commercial cadmium electroplating, close adhesion and compactness are of prime importance in order to obtain an article of good finish and receptive of a high polish.

Physical Properties of Cadmium and Cadmium Deposits.

Atomic radius	1.6 angstroms
Atomic volume	12.9
Coefficient of expansion ...	.0000306 at 0—100 deg. C.
Melting point	320 deg. C.
Specific resistance	6.2 to 7.0 microhm per cm. at 0 deg. C.
Specific heat	.05669
Temperature coefficient of resistance	424 at 0—100 deg. C.
Tensile strength	13,660 lb. per sq. inch
Elongation	44 per cent.
Thermal conductivity ...	0.22 gramme-calorie per cu. metre per degree per sec.
Electrochemical equivalent...	2.0955 grms. per amp. hr.
Boiling point	778 deg. C.

Electro-deposited cadmium takes a high polish and is highly resistant to tarnishing when exposed to atmospheric conditions. The colour of electro-deposited cadmium approaches that of silver, but it retains its polish without tarnishing longer than silver or silver alloys. It is superior to tin as a rust-proof agent for iron and steel.

Electro-deposition of Cadmium from Cyanide Solutions.

The electrolyte used for commercial cadmium deposition usually consists of a complex solution of cadmium carbonate in a potassium cyanide solution. The cadmium content may vary from 8 to 40 grammes per litre, with an excess of 5 per cent. of potassium cyanide. The anodes generally consist of pure cadmium, operated at an e.m.f. of 3 volts, and the solution is maintained at a temperature of 35 deg. C. Blaset (*Metal Industry*, January, 1912, p. 13) maintains that freshly precipitated cadmium carbonate should be used, as it gives better results; it is prepared by precipitating the cadmium sulphate with sodium carbonate and washing out the sodium sulphate by decantation, the cadmium carbonate being insoluble. The following quantities are suggested:—

Cadmium sulphate, 2 oz.
Potassium cyanide, 5 oz.
Water, 1 gallon.

All the metal is derived from the anode, which consists of pure cadmium sticks suspended in the electrolyte. The cyanide should be occasionally replenished by the addition of small quantities of cyanide solution. The electrolysis may be conducted in the cold at about 2 volts.

The Udylite Co., U.S.A., has recently patented a process for the cadmium electro-coating of steel and iron articles, edged tools, piano wires, and clock and watch springs, rendering them rust proof. According to the details given in the patent specification, the cadmium is electroplated on to the articles, which are then heat-treated and polished, an iron-cadmium alloy being produced on the surface. The bath used contains a 2.5 per

cent. solution of cadmium, prepared by dissolving the cadmium sulphate in water, just precipitating with caustic soda and re-dissolving in potassium cyanide solution, avoiding excess. The anode is pure cadmium, and a current density of 7 amperes per square foot is used. After deposition, the plated article is immersed in lime and heated at 250 deg. C. for four hours, a treatment which hardens the surface by forming a cadmium alloy, giving a highly desirable and superior surface.

Electro-deposition from Other Solutions.

Mathers and Marble (*Trans.*, Amer. Elect. Chem. Soc., 1914, Vol. 25, p. 297) claim that the properties which are peculiar to cyanide solutions of being able to give smooth cadmium deposits are due to the partial decomposition of the cyanide during electrolysis, forming colloidal substances which function as "additive" agents preventing the formation of rough crystalline deposits. The *rôle* of these "additive" agents has been but little studied, but they appear to play a very important part in electrolytic deposition processes.

Plating with solutions of cadmium other than in cyanides requires the addition of colloidal substances in order to produce a good deposit. The following solution has been found to give tolerable results in cadmium coating: 4 per cent. cadmium sulphate in 4 per cent. fluosilicic acid and 0.1 per cent. peptone at a current density of 3.6 amperes per square foot. Another electrolyte is 4 per cent. cadmium perchlorate in 7 per cent. perchloric acid, with 0.1 per cent. peptone; it gives a bright smooth deposit. Fluoborates or fluorides may also be used, substituting for peptone glue or clove oil.

Cowper-Coles (J.S.C.I., 1904, p. 446) states that cadmium-silver alloys have been deposited on a commercial scale, an alloy containing a small percentage of silver having been employed for coating the bright steel parts of machines, whilst domestic articles have been plated with a cadmium alloy containing 7.5 per cent. silver. Such alloys have been found to withstand tarnishing much better than pure silver or standard silver containing 7.5 per cent. of copper. Very careful adjustment of the concentration of the solutions and the current densities seems to be necessary in order to obtain a definite composition of the electro-deposited alloys, and, moreover, if the bath is to be maintained for any length of time in working condition, the anode must be of the same composition as the deposit required. Any change in composition of the deposit during electrolysis is immediately reflected in its colour and general appearance, both properties being excellent guides to the skilled and experienced operator. Budgen maintains that for every composition of the electrolyte, there is a definite current density to be used so as to produce a good and regular deposit. The ratio of the cadmium and silver in solution is dependent on the density of the solution, different proportions of the two metals being necessary if the solution is very dense. It is, however, desirable to use a strong solution, because a greater current density can be employed, and consequently the alloy can be deposited more quickly. The stirring of the solution permits the use of still higher current densities, but the proportion of the metal must be adjusted accordingly.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

Correction.—We regret that owing to an error in the preparation of the advertisement of the Qualitas Electric Co., Ltd., appearing on Supplement 19, the address of the company is incorrectly given. For Dashwood House, please read Fulwood House.

Anglo-German Trade.—A conference to discuss questions as to the interpretation and effect of certain provisions of the Anglo-German Treaty of Commerce and Navigation was commenced at the offices of the Board of Trade on November 9th.

Increasing the Lighting Load.—The Ohio Public Service Co. has by an intensive "home-lighting" campaign increased its annual revenue per customer by 20.6 per cent. According to the *Electrical World*, it was found that the average wattage used for lighting in consumers' kitchens was 50. It was calculated that a 150-W lamp in a suitable fitting was necessary to give adequate, glareless illumination. Assuming that the lamp in the kitchen was "on" for 1,000 hours—a conservative figure—it appeared that there was scope for the sale of an average of 100 kWh more to consumers. On this basis the increase in the net revenue was calculated at $7 per customer annually. By an intensive "drive," an enormous number of kitchen-lighting units were sold—over 14,000. The company next turned its attention to outlets and table lamps, and then to the improvement of the lighting in various rooms. In these directions more than 10,000 improved lighting fixtures were disposed of, most of which required larger lamps than had been previously used. Finally, the company conducted a "re-lamping" campaign, inducing the customers to fill all empty sockets and replace lamps of inadequate wattage. This, in four months, resulted in the sale of the equivalent of 2,000 kW of lamps.

The British Industries Fair.—Visitors to the British Industries Fair next February will again have the privilege of travelling to and from London or Birmingham at the cost of the single fare and one-third. The concession is the more valuable as there are none of the usual restrictions as to trains or time.

It is reported that the Air Ministry has purchased the buildings and 179 acres of land at Castle Bromwich (where the Fair is held) for £60,000. The place is to be used as an aerodrome—its original purpose.

The Fair authorities state that a large number of applications for space in the London section have been received from radio apparatus manufacturers, and it is hoped to have a very representative display of this equipment. It is further stated that the Fair has the wholehearted support of the National Association of Radio Manufacturers and Traders.

British Empire Exhibition.—The decision to voluntarily wind up the British Empire Exhibition was confirmed at a meeting of the Association held last week, and Mr. J. H. Thomas, Sir J. A. Cooper, and Sir A. E. Whinney, were appointed joint liquidators.

Unemployment Insurance Inquiry.—The Minister of Labour has appointed a committee "to consider, in the light of experience gained in the working of the Unemployment Insurance scheme, what changes in the scheme, if any, ought to be made." The following are the members of the Committee:—Lord Blanesburgh, G.B.E. (chairman), Sir Hugo Hirst, Bart. (chairman and managing director of the General Electric Co., Ltd.), Sir Glynn Hamilton West (chairman of Sir W. G. Armstrong, Whitworth & Co., Ltd.), Miss Margaret Bondfield, Sir James Curtis, K.B.E., Prof. Carless Davis, C.B.E., Mr. J. Hamilton, Mr. Frank Hodges, Mr. A. Holmes, Mr. Laurence Holt, Sir James Lithgow, Bart., Sir William McLintock, K.B.E., and Viscountess Milner. The secretary is Mr. J. A. Dale, of the Ministry of Labour, Queen Anne's Chambers, Broadway, S.W.1

Chinese Notes.—A number of cotton-ginning firms in Hanyang intend to install electrical machinery when the Hanyang electrical plant, now in course of erection, is completed.

The Yen Ming Electric Light Co. is being formed at Kutang, Kiangsu province, with a capital of $10,000.

Radio Traders' Associations.—The Bombay Presidency Radio Traders' Association is the name of a new body lately formed in India to protect the interest of the trade as well as to foster an interest amongst the public for radio by co-operating in making the broadcast programmes more interesting and also by conducting suitable propaganda. Increasing business is being done in wireless apparatus throughout Australia. The New South Wales Electrical Employers' Federation (radio section) which has almost every trader on its membership list, is appointing a high-salaried publicity manager, who is being given full authority to establish offices, and an efficient staff at an early date. His mission will be to "boost" broadcasting among the public, to supply daily and country papers with news on wireless subjects, and to benefit the radio trade in general. By an amendment to the Post and Telegraph Act which recently came into operation in New Zealand, dealers in radio equipment are required to take out a licence with the Minister of Telegraphs and to keep a full record of all sales and the names and addresses of purchasers. Power is given to revoke licences and the penalty for a breach of the provision is a sum not exceeding £50.

The E.L.M.A. Bureau at Glasgow.—At the Scottish Electric Lighting Service Bureau, Glasgow, on November 12th, Mr. H. E. Hughes, district engineer, gave an interesting demonstration and lecture to ladies. He pointed out that it was in Glasgow that Lord Kelvin lighted the first house with electricity, but said that Britain was now strangely far behind America and the Continent in the use of electrical appliances. The difficulty was to make people use light correctly. Examples were given of correct lighting installations for shops and the home.

Lead.—Reporting on November 14th, Messrs. James Forster & Co. stated:—"The present high price of lead, in our opinion, is entirely due to the support afforded to this market by the American position and, should conditions become easier again in that country, it would be quickly reflected in a lower price here." The Board of Trade returns for October were:—Imports, 25,758 tons; exports, 2,676 tons; leaving for home consumption, 23,082 tons.

Trade Announcements.—Mr. A. B. Blakey, A.M.I.E.E., electrical engineer and manufacturers' agent, informs us that his telephone number is "Midland (Birmingham) 3737."

Messrs. P. Adair, Ltd., of London, have opened a branch office and stores at 30A, Change Alley, Sheffield, in charge of Mr. A. Walkington, of Nottingham. Stocks of lamps, cables, &c., are carried. Telephone number: "5151 Central."

Messrs. Heughan & Gilmour, electrical and mechanical engineers, 79, Grant Road, Wellington, N.Z., require agencies for manufacturers of high-class electrical goods. They ask f r catalogues and shipping particulars.

The registered office of the British Aluminium Co., Ltd., is now: Adelaide House, King William Street, London, E.C.4.

Messrs. Robinson & Hands Electrical Co., Ltd., of Birmingham, have opened an office and stores at Station Road, Taunton, Somerset, for trade in the West of England. Supplies are available for electrical contractors and radio dealers. Telephone No.: "495 Taunton."

Messrs. May & Padmore, Ltd., have appointed Messrs. Markes, Ward & Co., Ltd., 30, High Street, Islington, N.1, as their sole electrical agents in London and district for "Maymore" electric fires and heating apparatus, &c., of which they are holding a stock.

Messrs. Electrical Devices, Ltd., have opened new offices, stores and showrooms for extension purposes at Powdene House, Pudding Chare, Newcastle-on-Tyne.

The London Electric Stores, Ltd., has moved to 9, St. Martin's Street, Leicester Square, London, W.C.2. Telephone No.: "Regent 7545."

Catalogues and Lists.—The Midland Accumulator Co., Ltd., 47, Newhall Hill Parade, Birmingham.—A leaflet containing descriptions and prices of high-pressure accumulator batteries for radio work.

Automatic & Electric Furnaces, Ltd., 173-175, Farringdon Road, E.C.1.—Catalogue Section C, describing the company's electrically-heated carburising furnaces. Illustrated.

Messrs. Smith & Ansell, Stockfield Works, Acocks Green, Birmingham.—A priced pamphlet illustrating electric lamps of classic design for suspension from a ceiling.

Messrs. F. A. Wilkinson & Partners, Ltd., Gretton, nr. Kettering.—A priced and illustrated leaflet describing automatic high-speed wind dynamos for battery charging.

Messrs. L. G. Hawkins & Co., Ltd., 30-35, Drury Lane, W.C.2.—A well-illustrated catalogue of ornate domestic electrical appliances.

The Marconiphone Co., Ltd., 210-212, Tottenham Court Road, W.1.—A coloured poster effectively advertising "Mellovox" loud speakers, and a coloured showcard advertising the company's "Ideal" and "Ideal Junior" radio transformers.

Messrs. R. A. Lister & Co., Ltd., Dursley, Glos.—An illustrated catalogue and price list of the company's electric lighting and power sets.

Messrs. Sydney Jones & Co. (London), Ltd., 28, Endell Street, W.C.2.—A trade price list of radio accessories and components.

Fuller's United Electric Works, Ltd., Woodland Works, Chadwell Heath, Essex.—An illustrated booklet dealing with "Sparta" loud speakers, anode supply filters, resistance-capacity and reaction couplings, &c. Priced.

The Wholesale Fittings Co., Ltd., 23-27, Commercial Street, E.1.—An illustrated and priced catalogue of "Supastone" lighting glassware, together with a supplementary list.

Tungsram Electric Lamp Works (Great Britain), Ltd., 72, Oxford Street, W.1.—An illustrated folder containing details and prices of the company's vacuum and gasfilled lamps.

Runbaken Magneto Co., 270, Deansgate, Manchester.—A "repairs and spares" price sheet, containing particulars of dynamos, parts, &c., for many makes of automobiles.

The Albert & J. M. Anderson Mfg. Co., 12, Moor Lane, E.C.2.—A leaflet describing self-aligning racks for power and telephone cables.

W. T. Henley's Telegraph Works Co., Ltd., 11, Holborn Viaduct, E.C.1.—Pamphlet "W.B.A.," advertising "Henley" link disconnecting boxes with teak frames. The prices of frames are given.

Higgs Motors, Witton, Birmingham.—November stock list of d.c. motors and dynamos and a.c. motors.

Caxton Name Plate Manufacturing Co., 11, 13, and 15, Rochester Row, S.W.1.—Pamphlets dealing with the firm's name plates and interchangeable stencils.

Ateliers de Constructions Electriques de Charleroi, 56, Victoria Street, S.W.1.—November stock list of a.c. motors, and d.c. motors and dynamos.

Messrs. J. H. Taylor & Co., Macaulay Street, Huddersfield.—A comprehensive price list of radio apparatus of all makes.

Siemens & English Electric Co., Ltd., 39, Upper Thames Street, E.C.4.—November price sheet of electrical materials, appliances, and accessories.

Mr. Alan Wright, Sentinel House, Southampton Row, W.C.1.—A folder containing illustrations, details and prices of "Inventum" electric fires with plug-in elements.

Messrs. Newton & Wright, Ltd., 471-3, Hornsey Road, N.19.—A series of illustrated leaflets dealing with apparatus for ultra-violet therapy, and diathermy and X-ray equipment. Priced.

The Mullard Wireless Service Co., Ltd., Nightingale Lane, Balham, S.W.12.—A window poster in subdued colours advertising the "Mullard" radio valve.

Bankruptcy Proceedings.—W. G. Conway (Listron), wireless component dealer, 88-90, Chancery Lane, W.C.—Receiving order made November 9th on creditor's petition. First meeting November 26th. Public examination January 27th, both at Carey Street, W.C.

S. Purcell, The Arcade, Goole, Yorks., electrical contractor.—The public examination of this debtor was held recently at the Court House, Wakefield. The statement of affairs showed liabilities of £185, and there was a deficiency of £63. Debtor attributed his failure to bad trade and keen competition. The examination was closed.

W. A. A. C. Robinson (W. A. C. Robinson), electrical engineer, 10, Carnaby Street, Golden Square, W.—Application for discharge to be heard November 24th at Carey Street, W.C.

Griffiths & Hughes, electricians, Whitcombe Street, Aberdare.—Receiving order made November 6th on creditor's petition.

V. Reed, electrical engineer, 10, Chapel Road, Eastville, Bristol.—First meeting November 18th at the Official Receiver's offices, 26, Baldwin Street, Bristol. Public examination November 27th at the Guildhall, Bristol.

G. F. Neal, electrical engineer, 5, Smallgate, Beccles.—Trustee, Mr. H. P. Gould, Official Receiver, 8, Upper King Street, Norwich, released November 9th.

J. Wilson, electrical engineer, late of 70, Ebrington Street, Plymouth.—First meeting November 19th at 11, St. Aubyn Street, Devonport. Public examination December 18th at the Western Law Courts, Guildhall, Plymouth.

J. R. Charnock, cycle dealer and electrical engineer, late of 6, Stonegate Road, Leeds.—Re-opening of public examination November 24th at the Court House, Leeds.

C. F. Lindop (C. F. Lindop & Co.), electrician, late of 62, Dale Street, Liverpool, now of 135, Lark Hill Lane, Liverpool.—Bankrupt's discharge granted subject to consenting to judgment being entered against him by the Official Receiver, trustee, for the sum of £25.

G. A. Morley (A. Whale & Co.), electrician and wireless engineer, 201, Powis Street, Woolwich.—Trustee, Mr. T. Gourlay, Official Receiver, 29, Russell Square, W.C., released November 2nd.

L. Priday, plumber and electrician, 20-22, Somers Road, Southsea, Hants.—Trustee, Mr. C. Hoult, Official Receiver, 87, High Street, Portsmouth, released November 2nd.

M. Breingan, electrical manufacturers' agent, 57, Robertson Street, Glasgow.—Meeting of creditors November 23rd at the Faculty Hall, St. George's Place, Glasgow. Agent, Mr. A. E. Paterson, 180, Hope Street, Glasgow.

S. H. Bardwell, trading as Bennett, Bardwell & Co., 22, Church Street, Basingstoke, electrical engineer.—The public examination was held at the Winchester Bankruptcy Court on November 10th. The statement of affairs showed ranking liabilities of £616 and net assets valued at £266, leaving a deficiency of £350. Debtor attributed his failure to competition in business and heavy private expenses. The examination was concluded.

Company Liquidations.—A. C. Alexandra & Co., Ltd.—Mr. G. D. Pepys, Official Receiver, in a report shows that the total deficiency as regards creditors and contributories was £17,888. Mr. A. C. Alexandra offered a sum of £4,000 for the goodwill (if any) of the company, to procure the annulment of bankruptcy proceedings, and in settlement of all claims against him in the bankruptcy and liquidations, but Mr. Pepys states that only £600 has been received and this amount (of which a part is claimed by his trustee in bankruptcy) will be insufficient to pay the preferential creditors in full.

Middleton Electric Traction Co., Ltd.—Particulars of claims to the liquidators, Mr. T. Bower and Mr. T. H. Underhill, 88, Kingsway, W.C., by December 31st.

Diamond Wireless, Ltd.—A meeting of members is called for December 14th, at 442, Strand, W.C., to hear an account of the winding up from the liquidator, Mr. A. Hart.

Deed of Assignment.—P. R. Andrews, electrician, Town Green, Wymondham.—Particulars of claims were to be sent to the trustee, Mr. W. A. J. Osborne, Balfour House, Finsbury Pavement, E.C., by November 19th.

Dissolution of Partnership.—A. M. Young & Co., manufacturers of radio components and accessories and capstan press products, 52, Bordesley Street, Birmingham.—Mr. J. R. Whitehill and Mr. H. D. Kirk have dissolved partnership. Debts will be attended to by Mr. Kirk, who will continue the business under the same style.

Private Arrangements.—R. L. Johnson, electrician, 239, Rake Lane, Wallasey.—A meeting of creditors was held recently at Liverpool. A statement of affairs was submitted which disclosed liabilities of £405. The assets totalled £95, leaving a deficiency of £310. It was reported that the debtor commenced business at Seacombe about two years ago, with £40 capital. No books of account had been kept, with the exception of a day book, but it appeared that the turnover had been between £650 and £700 for the period. The debtor attributed his position to lack of capital and heavy expenses. It was decided that the deed of assignment already executed in favour of Mr. Parkin S. Booth should be confirmed. A committee of inspection was also appointed, consisting of a representative of the General Electric Co., Ltd., and Mr. John Airey. The following are creditors:—

	£		£
Electric Components Co., Ltd. ...	60	General Electric Co., Ltd. ...	210
Eaton, S., & Sons	30	Welsbach Light Co.	35
Electrolier Co.	25		

Peter Curtis, Ltd., 75a, Camden Road, N.W., manufacturing electrical and radio engineers.—A meeting of creditors was held on November 16th, when a statement was presented showing a deficiency. An offer of 4s. in the £ was made and accepted. Further details will appear in our next issue.

Book Notices.—"Molesworth's Pocket Book of Engineering Formulæ," 29th Edition. London: E. & F. N. Spon, Ltd. Price 6s.—This revised and enlarged edition contains a wealth of information concerning almost every branch of engineering. Commencing with many useful mathematical and mensuration tables, including the many conversion tables which are required at the least expected moments, it proceeds through data of every description, physical, chemical, &c., to the advanced calculus of engineering, civil, mechanical and electrical. Numerous tables of squares, cubes, powers and roots, reciprocals and logarithms, and also specially prepared tables for assistance in ascertaining the circumferences and areas of circles, &c., are included. The steam and hydraulic formulæ are another feature. In the electrical portion a brief explanation is given of most of the electrical terms. Of particular help to the electrical engineer should be the general information and tables concerning conductors and transmission lines and cables. Useful extracts from the I.E.E. regulations will no doubt prove a valuable addition. Several connection diagrams are also given. The contents are fully indexed.

"*Journal* and Record of Transactions of the Junior Institution of Engineers." Vol. XXXVI. Part II. November, 1925. Price, 2s.

"Memoirs of the College of Science, Kyoto Imperial University."—Series A, Vol. VIII, Nos. 5 and 6. August, 1925. Series A, Vol. IX, No. 1, July, 1925; No. 2, August, 1925.

"Transformers for Single and Multiphase Currents," by G. Kapp, revised by R. O. Kapp.—Third Edition. Pp. xi + 391; figs. 229. London: Sir Isaac Pitman & Sons, Ltd. Price, 15s. net.

"Scientific Papers of the U.S.A. Bureau of Standards."—Vol. 20, No. 512; 10 cents.

"Technologic Papers of the U.S.A. Bureau of Standards."—Vol. XIX, Nos. 291 and 293, 25 cents each; No. 294, 10 cents.

"Miscellaneous Publications of the U.S.A. Bureau of Standards."—No. 64, 15 cents.

German Activity in India.—The Berlin correspondent of the Exchange Telegraph Co. states that, following the example of the Siemens concern, the A.E.G. has established a branch in India at Bombay under the name Havero Trading Co. (A.E.G. Department). The Bergmann Electro-Works Co. also proposes to establish an Indian branch.—*Financial News.*

New Swiss Company.—A new company has lately been formed in Berne (22, Spitalgasse) under the style of the Gesellschaft für Radiotechnik, to manufacture radio apparatus.

Transport Cost Reduction.—In the course of a paper which he read recently before a meeting of the Wholesale Produce Merchants' Association, Mr. C. Holmes Waghorn, general manager of Walker Vehicles, Ltd., stated that most wholesale distributors of produce spent from 2 to 5 per cent. of their turnover on transport and delivery charges. It was therefore a sound principle to discover what means of carriage was best suited to each class of distribution. Nine-tenths of the tonnage in produce road-haulage in this country was intensive, *i.e.*, was borne on routes 20 or 30 miles in length with frequent stops. This demanded road vehicles of the largest possible carrying capacity commensurate with the smallest street encumbrance, and the highest possible manœuvring and convenience factors. In the author's opinion the latest developments of the electric vehicle afforded a solution. Although the maintenance of the petrol vehicle was a considerable item, in its own sphere—over distances of between 30 and 60 miles—the petrol lorry was irreplaceable. The economic field of the steam vehicle was now generally understood to be confined to loads of over 10 tons on journeys not requiring long loading or delivery stops or encountering excessive traffic density. The use of horses was on the wane, although for very frequent stops the horse was worth its keep. Only one form of vehicle really met the requirements of intensive transport—the electric vehicle. The author then briefly outlined the virtues of the battery vehicle, mentioning its reliability, ease of control, cleanliness, economy, &c. With modern types of accumulators little trouble was experienced and numerous charging facilities were available. As a proof that the electric vehicle was satisfactory in service Mr. Waghorn quoted the names of firms which employed it extensively.

Turbine Construction in Norway.—Some time ago great indignation was caused in Norway on account of the Government authorities having placed orders with a German firm for turbines for the State hydro-electric works at the Nore, because the German prices were considerably lower than those quoted by Norwegian engineering works. Now that two further turbines are required for the same power station the directors of the Water Power Department have unanimously resolved to recommend the acceptance of Norwegian tenders for the execution of the work, and this proposal has been adopted by the State Labour Department, which has decided that the turbines shall be made by the A.S. Kvaerner Bruk and the A.S. Myrens Verksted as joint contractors.

The French Electrical Market.—The United States Commercial Attaché in Paris, in the course of a recent report, stated that the demand in France for electrical equipment continued strong, with factories receiving a good volume of orders. Prices of electrical apparatus had, however, risen, and the same was the case with industrial machinery.

Russian Foreign Orders.—*Reuter's* representative recently interviewed M. Frumkin, Soviet Assistant Commissary for Foreign Trade, who during the past month has been visiting Berlin, Paris and London, with a view to inspecting the activities of Russian Trade Organisations in those cities and ascertaining the conditions for placing orders, chiefly for machinery, in this country and elsewhere. M. Frumkin said that orders would shortly be placed abroad for machinery for, *inter alia*, the oil, coal-mining, metallurgical, engineering, electrical, timber, paper-making, and chemical industries. The general impression he had gathered was that of the three countries France could offer very favourable conditions on account of her depreciated currency, and machinery could be got there very cheaply. "Germany," said M. Frumkin, "gives us much more favourable terms than Great Britain and, from a technical point of view, is very highly developed. It is, however, in my opinion of great importance that we should have our machinery from Great Britain and we are very keen on getting old British machinery replaced by new. . . . The whole amount at present in view to be spent in Great Britain is about £15,000,000, and for this and other orders we only want the same credit conditions as apply to other countries, such as France, Italy, Germany, Czecho-Slovakia, &c." M. Frumkin referred to the fact that the whole trade turnover with Great Britain had been raised from £15,000,000 in 1922 to £49,000,000 in the present financial year, and it was hoped that, owing to a good harvest and the general economic progress, this trade in the following year would be increased by about 80 per cent.

New French Company.—A new company has lately been formed in Paris (54, Rue de la Boetie) with a capital of 150,000 fr. and the title La Société de l'Energie Hydro-Electrique du Lot, to establish plant to utilise the water power of the River Lot.

American Co-operation in Building European Power Stations.—It is reported from New York that bankers and industrialists in the United States intend to form a syndicate with a capital of $26,000,000 under the title of the American Utilities Corporation, with the object of co-operating with European interests in the realisation of schemes for the establishment of power stations which have been brought forward in Poland, Czecho-Slovakia, and Roumania.

Keeping in Touch.—In the United States sellers of electrical appliances are realising more and more that an article is not finished with when it is sold. If it goes wrong the customer will most certainly return, but if it continues to give good service, which is generally the case, the sale can still be a link between the seller and the buyer. *Electrical Merchandising* quotes a case in this connection. The Nashville (Tennessee) Railway & Light Co. makes it a part of its selling policy to keep an eye on all electric cookers which it sells. Periodically a letter is sent out to the buyers of these appliances asking a number of questions about the customer's experience with her range. It is asked if any trouble has been experienced, whether the company's service has been found satisfactory, how the cooking compares with that done by other means, &c. The final question is: "Can you recommend the range to your friends?" The company finds that over 80 per cent. of these letters are answered in full, and, upon the average, two and a half new "prospects" are discovered with each answer. This is quite apart from the number of other appliances which are sold to satisfied owners of cookers.

The Committee on Industry and Trade.—It was announced last week that the period allotted by this Committee to the hearing of evidence from trade organisations and other bodies and individuals is drawing to a close. The prefatory memorandum which accompanied the Committee's recent "Survey of Overseas Markets" is being published by the Stationery Office in pamphlet form.

Copper, Lead, and Rubber Prices.—Messrs. F. Smith and Co. report, November 17th: Copper (electrolytic) bars, £68 15s., 10s. inc.; ditto, ditto sheets, no change; ditto, ditto wire rods, £77 10s., 5s. inc.; ditto, ditto h.c. wire, 10d., 1/16d. inc.

Messrs. James & Shakespeare report, November 17th: No change in the prices of copper bars (best selected), sheet and rod; English pig lead, £38, 15s. dec.

Messrs. Ed. Till & Co. report, November 17th: India-rubber, Para fine, 3s. 10d., ½d. inc.

One Way to Help Export Trade.—The employés of James Pender & Co., Ltd., a subsidiary of the British Empire Steel Corporation, manufacturing nails and wire, in St. John, N.B., have presented the management with a resolution, expressing their willingness to work overtime without pay, in order to permit the company to compete with foreign manufacturers in export markets. Mr. W. F. Knoll, manager of the company, said that a few weeks ago, word came to him that European firms were underbidding Canadian prices to a great extent on account of the low rates of exchange in some of the export fields, and that difficulty was experienced in marketing the products from this country. The matter was discussed at one of the council meetings between the management and employés of the Pender Company, and a suggestion made that if the cost of production were cut sufficiently by free overtime work, the local firm might be able to compete with the foreign manufacturers. The men asked for a few days to consider the proposition, and returned with the announcement that they were prepared to try the experiment, in order to hold the market for the company, and thus keep the wheels turning in the regular hours of work. The provision is made that should any profit accrue from the export business under this arrangement, it will be shared between the company and the employés on a 75-25 per cent. basis, the big end of the division going to the men. It is planned that for a start the men will put in three extra hours every other evening.—*Journal* of the British Empire Chamber of Commerce in the U.S.A.

The "Canning" Trade Mark.—MESSRS. W. CANNING AND CO., LTD., of Birmingham, have been successful in obtaining registration of the name "Canning" as a trade-mark relating to electro-plating, polishing and lacquering machinery, including the necessary equipment and materials. Some of our readers may be unaware that the House of Canning has been established 140 years. In future the name "Canning" will apply solely to goods manufactured by the company.

The Rating of Machinery.—The Government's new Rating and Valuation Bill, which contains provisions respecting the exemption of machinery from rating, which has been contended for by the Machinery Users' Association for many years, stands committed to the consideration stage and third reading in the House of Commons early in the Session which opened on Monday last.

Wages in the Australian Electrical Industry.—From statistics relating to the wages paid to Australian electrical workers during 1924, reproduced in the *Australasian Electrical Times*, it appears that the wages paid to armature winders, instrument makers, cable jointers and fitters, the highest-paid grades, ranged from £5 3s. per week in Perth to £5 15s. in Sydney. The wages of other grades ranged, in general, from £4 17s. in Perth to £5 7s. in Sydney.

For Sale.—Mr. H. J. Shaw will sell by auction on December 1st at 85, Newington Causeway, S.E., a quantity of wireless and electrical goods, &c. Fuller, Horsey, Sons & Cassell will sell by auction on December 2nd, at Church Wharf, Chiswick, electric motors, circuit breakers, and switchgear. (See our advertisement pages to-day.)

American Industrial Activity.—The *Electrical World* states that all authorities agree that the trend of United States business during September was very satisfactory and that the volume of trade this autumn will be perhaps the largest that the country has ever experienced. Several of the primary industries, however, which exert a large influence upon the operations of the electrical industry are still operating below normal. In September the iron and steel industry was operating at 15.2 per cent. and the textile industry at 2.3 per cent. below normal, but practically all primary industries reported increased operations over August. During September the electrical industry as a whole was operating at 4.1 per cent. below the estimated normal for the month. In August it was operating at 5.6 per cent. (revised), and in July at 4.5 per cent. below normal. Incomplete returns indicate that the electric light and power branch of the industry continued the upward swing which started in June and was operating at 2.8 per cent. above normal during September.

The Czecho-Slovakian Electrical Market.—A recent issue of *Commerce Reports* contained a review of the possibilities for the sale of domestic electrical appliances in Czecho-Slovakia. At the outset it is stated that gas is in the ascendancy owing to its cheapness as compared with electricity. Fans, owing to the mild climate, are not extensively used, but such as are found are of German or Italian make. Vacuum cleaners are gradually finding a market in the country; Swedish makes predominate, although German, English, and American patterns are also used. The only article of laundry equipment which sells well is the flat-iron; it is not thought that the market for washing machines is likely to develop. Electric cookers are not used, as the high price of energy prohibits them, but small cooking equipment, such as toasters, percolators, and kettles, are in fair demand; most of these appliances are German. "Headlight" (bowl) heaters are used quite extensively for incidental heating; the most popular appliances of this type are home products, but German heaters are imported. It is believed that the country presents a good potential market for electro-therapeutic appliances. Prague dealers usually buy direct from the foreign manufacturers, but sometimes they obtain goods from European general distributors. The importation of domestic electrical appliances is subject to import permits issued by the Ministry of Commerce; these, it is stated, are freely granted.

The Dunedin Exhibition.—The *Daily Mail* reports that the Dunedin Exhibition, which is one-third the size of Wembley, was opened on Tuesday last. Although an international display, it is almost purely British in character; the British Court provides a magnificent display.

Electricity in Tin Mining.—Speaking at the annual meeting of the Northern Nigeria (Bauchi) Tin Mines, Ltd., last week, the chairman (Mr. G. Temple Harris) said that the outstanding feature in the company's business during the past year was the completion of the Kwall Falls installation. This hydro-electric works was reported to be very successful and doing all that had been asked of it. Mr. A. R. Canning said that the institution of the Kwall Falls scheme opened up a new era for the company. An enormous amount of work had been put into the scheme since its conception nine or ten years ago. The chairman, in reply to a question, said that the production costs would be cheapened by means of the power now available.

The Parsons Plant at Chicago.—The 50,000-kW turbo-alternator and condensing plant for the Crawford Avenue power station of the Commonwealth Edison Co. of Chicago, which was manufactured in the works of Messrs. C. A. Parsons & Co., Ltd., at Heaton, Newcastle-on-Tyne, was shipped to Chicago in August, 1924. The erection was completed and the plant was ready for service on the day of the opening ceremony, May 26th, 1925. We understand that except for slight preliminary adjustments, which in a plant of this description and size are inevitable, the machine has run more or less continuously, carrying its full share of the load of the station. The pre-heaters for this machine have not yet been installed by the Commonwealth Edison Co., and so far no figures as to steam consumption are available.

Japanese Electrical Notes.—The electrification of the Imperial Steel Works, Mawata, Kyushu, is proceeding rapidly.

The Tenryugawa Electric Power Co. (capital 50 million yen) is to erect six power stations, with an aggregate capacity of 150,000 kW, on the Tenryu River. The work is expected to occupy seven years from next May.

The Keihan Electric Railway is doubling its power-station capacity by installing a 5,000-kW set, which has been ordered from a Japanese firm. Preliminary steps are being taken in connection with the erection of a 2,000-kW station by the Sendai municipality.

The Hamana Hydro-Electric Co. has been formed to erect a station to develop 10,000 kW from the Denoyu River, at a cost of 3½ million yen.

An application for permission to install an electric railway between Mishima and Hakone has been filed. A number of other electric railways are projected. One of the most important schemes is that of a group in Kyushu, which has a capital of 2 million yen.

Unemployment.—The total number of persons registered as unemployed on November 2nd was 1,207,700. This was a decrease of 24,696 on the week, and for the first time this year the figure was below that for the equivalent date of last year. During the following week there was a further decrease of 9,512.

Lighting and Power Notes.

Alston.—PROPOSED ELECTRICITY SCHEME.—A committee has been appointed to consider the question of obtaining an electricity supply for the town.

Ayrshire.—YEAR'S WORKING.—We have received from Mr. W. C. Bexon, engineer and general manager, a copy of his report, together with the statement of accounts, on the first year's working (year ended May 15th last) by the Ayrshire Electricity Board, of the Ayr and Kilmarnock electricity undertakings, formerly controlled by the Ayr and Kilmarnock Corporations respectively. The total revenue amounted to £168,968, and the working expenditure was £77,228, leaving a gross profit of £91,740, to which was added a balance from the previous year of £2,203, making a total of £93,990 available. This was disposed of as follows:—Capital and other charges, £88,598; transferred to appropriation account, £2,250; balance, being profit for the year, carried forward, £3,142. The capital expenditure during the year amounted to £148,879, the largest items being £88,598 for mains and £41,776 for machinery. The sales of electrical energy amounted to 25,780,564 kWh, and the average price obtained was 1.573*d*. per kWh. The maximum supply demanded was 12,500 kW. During the year two 50,000-lb. Babcock & Wilcox boilers were installed, and work was commenced on the installation of the second 12,500-kW turbo-alternator. Additional sub-stations were erected, and the number now in the area exceeds 100. Other work completed during the year included the interlinking of the power stations at Greenock, Paisley, and Kilmarnock.

Brandon and Byshottles (Co. Durham).—ELECTRICITY SUPPLY.—The Urban District Council has decided to support the Chamber of Trade in its endeavours to secure electricity for the lighting of private premises, and has also agreed that the surveyor shall obtain for submission to the next meeting of the Works Committee the scale of charges from Newcastle Electric Supply Co. for street lighting.

Bristol.—ELECTRICITY AGREEMENT.—The Electricity Committee has made a further agreement for a bulk supply of electricity to the North Somerset Electric Supply Co., Ltd., which involves the laying of mains and the construction of a sub-station at an estimated cost of £20,703.

ELECTRICITY SCHEME APPROVED.—The Electricity Committee's proposal to erect a new power station at Portishead, details of which were given in the ELECTRICAL REVIEW of October 23rd, p. 665, was passed by the City Council on November 9th. The Committee has already obtained provisional approval from the Electricity Commissioners to the scheme.

Burnley.—"ALL-ELECTRIC" HOUSES.—With a view to encouraging the use of electricity for domestic purposes, the Corporation is to erect four "all-electric" houses for demonstration purposes.

Cannock.—ELECTRICITY EXTENSION.—Mr. S. T. Allen, electrical engineer, has submitted a report to the Electricity and Omnibus Committee showing that the estimated cost of the proposed electricity extensions to Great Wyrley and Cheslyn Hay is £20,785.

Clayton (Yorks.).—ELECTRICITY SUPPLY.—At a recent meeting of the Urban District Council, a deputation reported having interviewed Bradford Corporation Electricity Committee with regard to the proposed supply of electricity to Clayton. The Corporation agreed to adhere to the charges and conditions laid down in an agreement formerly made between the two authorities, and stated that if there was no opposition to its application for an Order, a supply would probably be available within six months.

Continental.—FRANCE.—The Société de l'Energie Electrique de Rouergue, which owns a 6,000-kVA hydro-electric power station on the River Tarn, is preparing to establish a second plant of 32,000-kVA capacity to utilise the Pinet Falls on the same river.

BELGIUM.—According to the report for the year ended June 30th last, the Société d'Electricité de l'Ouest de Belgique, of Brussels, is now supplying electricity to 74 localities, while negotiations for supplying 24 other communal districts are in progress. During the year 168 miles of new h.p. and l.p. mains were laid, bringing the total up to 708 miles. Other work completed during the year includes the establishment of 50,000-V transmission lines between Renaix and Audenarde and between Swevelghem, Vive, and St. Bavon. The company's plant capacity is now 19,510 kW.

Darley Dale.—INQUIRY.—The opposition of the various local authorities and the residents of Darley Dale to the proposal of the Derbyshire and Nottinghamshire Electric Power Co., to erect overhead power cables from Matlock to Darley Dale was the subject of an inquiry on November 5th at Darley Dale by Sir W. F. Marwood. The company applied for wayleaves over property belonging to Mr. T. Wright and the Oaker Trust. The opposition contended that the cables would depreciate the value of that property and would ruin the beauties and amenities of the valley. Mr. A. D. Phillips, general manager of the company, said that the cable would be similar to those which were being erected in all parts of the country. To take the cable underground would cost an additional £1,750. The Ministry of Transport's decision will be announced in due course.

Glasgow.—PROGRESS DURING SEPTEMBER.—During September 107 houses were wired under the Corporation Electricity Department scheme, making the total to date 1,287 and 470 applications for the hire of fires, cookers, time switches and boilers were received, bringing the total to 7,903.

Gretna and Eastriggs.—ELECTRICITY SUPPLY.—The necessary capital (£4,000) has now been subscribed to enable a local company to take over the lighting of the townships of Gretna and Eastriggs from the Government.

Hastings.—LOANS.—The Electricity Committee is applying for sanction to loans of £7,000 for mains and £5,000 for meters.

ELECTRICITY EXTENSIONS.—The Committee is to extend the mains to supply electricity to Baldslow at a cost of £1,300, and to Grove Housing Estate at an estimated cost of £3,538.

Holbeach.—PROPOSED ELECTRICITY SUPPLY.—The Urban District Council has received a communication from the Boston and District Electric Co. inquiring whether the Council would entertain a proposal for a supply of electricity in bulk. The Council has decided to obtain further details of the proposal.

Iceland.—HYDRO-ELECTRIC DEVELOPMENT.—According to the *Board of Trade Journal*, during the last session the Icelandic Alting passed a law dealing with water power concessions. The law gives the right to private persons to exploit waterfalls within their own holdings of land provided that the power of the water-course does not exceed 500 h.p. The Government may grant concessions to Icelandic promoters for the exploitation of waterfalls where the power does not exceed 25,000 h.p. and where the district council in the area waives its right to make use of them. Concessions of 25,000 h.p. or more to foreign subjects and companies may only be granted by special Act of Parliament. Plants of less than 500 h.p. will pay no State charges. All others will pay to the State an annual sum, the minimum of which is 50 ore per h.p., and the maximum for the first twenty-five years 5 kroner per h.p. The Waterfalls Commission of 1917 estimated Iceland's water power at about 4 million h.p., of which practically none has been utilised.

Inverness.—PURCHASE OF UNDERTAKING.—At a meeting of the Town Council on November 9th it was decided to purchase the undertaking of the North of Scotland Electric Light and Power Co., Ltd., and to apply for a Special Order authorising the Council to supply electricity in its area.

King's Lynn.—YEAR'S WORKING.—The report on the working of the Corporation electricity undertaking (engineer, Mr. C. W. Jackson) for the year ended March 31st last, shows a total revenue of £18,725, as compared with £16,625 in the preceding year. Working expenses amounted to £10,454, as against £8,580, leaving a gross profit of £8,271 (£8,046), to which was added a balance of £4,700 from the previous year, making a total of £12,971 available. This was distributed as follows: Contribution to capital expenditure, £4,057; interest and other charges, £5,291; balance carried forward, £3,623. The capital expenditure during the year amounted to £4,718, and the amount now spent on the undertaking stands at £107,381. The sales of electrical energy increased from 1,056,799 to 1,504,665 kWh, and the average price obtained fell from 3.70d. to 2.89d. The maximum supply demanded rose from 873 to 1,102 kW.

New Zealand.—AUCKLAND.—Preparations will shortly be made by the Auckland Electric Power Board to take electricity from the Arapuni hydro-electric power scheme. Under the agreement with the Government the board will take power by April 1st, 1928, and its officers have prepared a report on the works necessary on the change over from steam-generated power. The scheme most favoured provides for current being transmitted at 22,000 V by underground and overhead cables, and the total estimated cost is £238,100.—*Tenders.*

Northern Ireland.—LETTERKENNY (CO. DONEGAL).—The Urban District Council has decided to ask Mr. Macrory, city electrical engineer, Londonderry, to prepare a scheme for the installation of electric lighting in the town.

Special Orders.—Application has been made to the Electricity Commissioners by the Long Eaton Urban District Council for a Special Order authorising it to include in its area of supply the area recently added to the urban district, and the parish of Toton.

The Commissioners have submitted to the Minister of Transport for confirmation, Special Orders made by them authorising the Bethesda Urban District Council to supply electricity in its area, and the Spalding Urban District Council in the urban and rural districts of Spalding.

Stockton-on-Tees.—EXTENSION OF SUPPLY.—The Electricity Committee is to canvass the Ragworth estate with a view to ascertaining the probable number of consumers, prior to taking any further action on the proposed extension of the cable which it is estimated will cost £5,500.

Stretford.—LOAN SANCTIONED.—The Electricity Committee has obtained sanction to borrow £4,925 for the provision of mains.

Sunderland.—WIRING OF SMALL HOUSES.—The Town Council has adopted a scheme submitted by the Electricity Department for installing electric lighting installations in certain houses of three to six rooms. This decision follows the adoption of a street lighting programme for all streets in the borough. The Council will undertake the cost of wiring houses, which is estimated will range from £5 14s. 7d. for a three-roomed house to £9 16s. 2d. for a six-roomed house. The owner or tenant will have the option of purchasing the installation from the Corporation at any time. The charge to tenants for the hire and maintenance of the installation will be 1s. 6d. weekly for the summer quarters, and 2s. weekly for the winter quarters, and electricity will be charged for at the rate of ¾d. per kWh. The initial outlay is not to exceed £8,000.

PRICE REDUCTION.—The domestic rate is to be reduced to a fixed standing charge of 15 per cent., of the rateable value of all houses (instead of the scale of percentages now in force) and after allowing 4 kWh per quarter per £ of net rateable value, the charge for further energy will be ¾d. per kWh.

Truro.—ELECTRICITY AGREEMENT.—The Town Council has approved a draft agreement with the Cornwall Electric Power Co. for a supply of electricity for the city.

Twickenham.—INQUIRY.—According to the *Surrey Comet*, an inquiry was recently held at the offices of the Electricity Commissioners by Sir Harry Haward and Mr. S. L. Pearce into the electricity charges of the Twickenham and Teddington Electric Supply Co. The inquiry was held on the application of the local authorities who appealed for an Order to vary the present authorised prices charged by the company. Mr. R. M. Montgomery, K.C., who represented the authorities, compared the charges with those of neighbouring companies, and stated that the high rate was detrimental to the property in the area. The authorities suggested a reduction of 3d. per kWh in the charges for lighting, a reduction of from 2d. to 1d. per kWh for power, and of 1d. per kWh for heating. Mr. N. Staniland, borough electrical engineer of Hornsey, stated that the company's charges would have a serious effect in deterring factories and other works from being opened on account of the prohibitive cost of electricity. Protests were also made by business concerns in the area. Mr. Craig Henderson, K.C., for the company, stated that the reduction of the maximum charge to 8d. per kWh, as suggested by the local authorities, would mean a reduction in the gross profit of approximately £10,000, which he contended was not justified at present. The reduction would also limit the company to paying a dividend of 5 per cent., which would prevent any further capital being raised. The Commissioners will give their decision in due course.

Winchester.—LOAN.—The Town Council has applied for anction to a loan of £19,153 for the following purposes :—The nstallation of one 1,250-kW turbo-generator, with condensing lant and pipe-work, £8,100; foundations, £750; connecting ables and switchgear, £650; vee notch recorder, £100; boiler ith mechanical stoker, piping and extensions to economiser, 4,964; foundations, £400; buildings and contingencies, 4,189.

Woolwich.—LOAN.—In connection with the proposed supply f electricity in bulk to Bexley and Erith, the Town Council as decided to apply to the Electricity Commissioners for nction to a loan of £34,446 for transmission lines, switch anels, and transformers.

United States.—ELECTRICAL DEVELOPMENT.—According to *ower*, applications have been filed by the Los Angeles Muniipal Bureau of Power and Light with the California and rizona Water Commissioners and the Federal Power Comission for permission to divert the waters of the Colorado iver near the town of Parker, Ariz. It is planned to conruct a dam at this site which would make available approxiately 1,500,000 acre-feet of water for the City of Los Angeles nd would develop at least 100,000 h.p. of electrical energy.

Officials of the Southern Power Co. announced recently, the ward to the American General Electric Co. of a contract for wo 50,000-h.p. steam turbines for a plant to be built, to afeguard the company against recurrence of the drought of is year. The new plant will be rated at 100,000 h.p., instead f 80,000 h.p., as was originally planned.

Tramway and Railway Notes.

Continental.—SWITZERLAND.—Work is in hand on the elecrification of the remaining portion of the railway between urich and Basle, and it is expected that the Bozberg section ill be completed for electrical operation next month. The ections between Zurich and Brugg and between Basle and ratteln have been electrically operated for some time.

Irish Free State.—LUCAN (CO. DUBLIN).—As the result of a nference at the Government Buildings, Dublin, between the ity Administrative Commissioners and representatives of the ublin United (Electric) Tramways Co., it is understood that n agreement has been reached for the early taking over of the ublin and Lucan Electric Railway, closed down since the eginning of the year, and that the electricity supply to instiitions and residents along the route will be restored. The ne will be connected up at the main gate of Phœnix Park ith the city service, thus giving a through service to the entre of Dublin. The Commissioners have agreed to grant an xtension of the tramway company's lease. The terms of the greement will be published shortly.

Nelson.—NEW CARS.—The Town Council is applying to the linistry of Transport for sanction to a loan of £5,800 for the urchase of three new double-deck tramcars.

Sheffield.—PURCHASE OF TRAMWAY.—The Corporation will ake over from Rotherham on January 1st next 2¼ miles of ngle tramway track between Tinsley depôt and the city oundary at Templeborough. The sum agreed upon for the ack, overhead line work, and eight tramcars is £14,475.

Stockton.—TRAMWAY IMPROVEMENTS.—The Joint Tramways ommittee has under consideration the doubling of the tramay track in Middlesbrough Road at an estimated cost of 13,700.

Stretford.—LOAN.—The Urban District Council is applying or sanction to borrow £11,837 in connection with the Talbot oad and Warwick Road tramway.

United States.—RAILWAY ELECTRIFICATION.—The electrificaon of the southern division of the Pennsylvania Railway, xtending from Philadelphia to Wilmington, Del., a distance 28 miles, will be started soon. The company announced on ctober 29th that arrangements had been completed to begin ie preliminary work necessary in making the change from eam to electric operation.—*Electric Railway Journal.*

Worcester.—RAILLESS CARS.—The Streets Committee will ask ie City Council at its next meeting to apply to Parliament for owers to replace the present tramway by railless cars, which, is suggested, should be confined to the city, and that powers ould be sought to run omnibuses on any routes in the city that the Council may hereafter decide whether to adopt ailless cars or omnibuses, or both.

Telegraph and Telephone Notes.

Canada.—DIRECTIONAL WIRELESS.—The Radio-Telegraph ranch of the Department of Fisheries announces the opening a directional wireless station on Belle Isle, at the northern ntrance to the Gulf of St. Lawrence. The new station will perate continuously on a wave-length of 800 metres, with the all letters "VCM." Belle Isle is the first landfall for translantic vessels traversing the northern route. The station ill be equipped with its own generating plant.—*Reuter* Ottawa).

Germany.—WIRELESS IN AEROPLANES.—The Aero Lloyd announces that, beginning with the winter season, its aeroplanes will be equipped with radio apparatus, which will enable the pilots to maintain constant communication with the aeroplane and meterological stations, and will therefore greatly increase the safety of flying.—*Reuter* (Berlin).

Irish Free State.—SHIPS' RADIO STATIONS.—The Irish Free State is almost unique in more ways than one. There are only two wireless stations—at Malin Head and Valentia—on the Free State coasts to which ships can appeal for help or guidance. Prior to the Treaty of 1921 numerous stations were available for emergency work and effectively watched the coasts of Ireland. When the transition of government took place all these stations were handed over to the Free State, and the majority were dismantled. What a serious matter this is for shipping has been demonstrated by a recent occurrence in Dublin Bay, says the *Irish Times*. Every ship of 1,500 tons registered in the Port of Dublin is obliged to carry wireless, and yet, should she get into difficulties a few miles outside the port, she is compelled to depend on the nearest wireless station, which happens to be Liverpool, 120 miles across the Irish Sea.

Russia.—TELEPHONE CAMPAIGN.—The Soviet Government has started a campaign to familiarise the Russian people with the telephone and its uses. At present the telephone plays a very small part in Russian life, there being less than one telephone to every 1,500 people, but the Soviet Government is said to be prepared to spend ultimately £20,000,000 in bringing the system up to date.

South Africa.—LONG-DISTANCE TELEPHONY.—According to the *British and South African Export Gazette*, the desired linking of Lourenço Marques with Johannesburg and Pretoria by telephone would cost over £25,000.

Radio Notes.

Brazil.—BROADCASTING SERVICE.—The Department of Overseas Trade informs us that the commercial secretary at Rio de Janeiro (Mr. E. Hambloch) reports the following particulars regarding broadcasting : There are 20 broadcasting stations in Brazil, which send daily communications to about 50,000 receiving apparatus. The number of such sets of apparatus in the Federal Capital of Rio de Janeiro is estimated at 20,000. The Radio Sociadade do Rio de Janeiro, with 6 kilowatts, and the Radio Club do Brasil, with 500 watts, send daily messages relative to trade, exchange quotations, meteorological service, and concerts, scientific addresses, &c. The Radio Sociedade also possesses an experimental 10-watt station, and another uses short waves for radio-telegraphy, with 40 watts, which has already succeeded in communicating with Swedish stations. The Radio Club has an experimental 1-kW station, while Mayrink, Veiga & Co. has an experimental 10-watt station. Two stations are working in Sao Paulo—the Radio Club de Sao Paulo, with 10 watts, and the Sociedade Radio Educadora Paulista, also with 10 watts. The latter will, however, shortly use 1 kW. The Sociedade Radio Educadora Paulista daily broadcasts commercial and meteorological information, as well as concerts, &c. There are three stations in Pernambuco, the largest being that of the Radio Club de Pernambuco (in the capital, Recife) of 300 watts. The others are the Radio Sociedade de Garanhuns and the Radio Sociedade Jader de Andrede, at Timbauba. The Radio Sociedade de Minas Geraes, installed at Bello Horizonte, uses 500 watts.

In other states of the Union the following stations are in operation :—Radio Sociedade de Bahia, 50 watts; Radio Club de Petropolis (State of Rio de Janeiro); Escola de Radiotelegraphie do Maranhao; Radio Club Clearense (Cears); Radio Sociedade de Parahyba (Parahyba do Norte); Radio Sociedade Pelotense (Rio Grande do Sul; and Radio Club de Campo Grande (Matto Grosso). It is estimated that more than 200,000 persons receive radio-telephonic communications from such broadcasting stations.

Broadcasting Inquiry.—GOVERNMENT COMMITTEE MEETS.—It is reported that the first meeting of the Broadcasting Committee appointed by the Postmaster-General, Sir William Mitchell-Thomson, was to have been held on November 19th. The British Broadcasting Co. is not represented on the Committee. The management, control, and finance of broadcasting after the expiry of the existing licence on December 31st, 1926, will be the chief subjects discussed. There are ten members of the Committee, the chairman of which is the Earl of Crawford, and, according to *The Times*, its sittings will begin early in December. In order that the Radio Society of Great Britain may be acquainted with the feelings of its members and of those of about 200 affiliated societies, arrangements have been made to hold a mass meeting, representaing about 15,000 persons, on November 26th. After a demonstration of "Talking Motion Pictures," by Mr. C. F. Elwell, there will be a debate on a resolution "That the present system of broadcasting, as represented by a single monopoly, is the best for this country." Prof. W. H. Eccles, past president of the Radio Society, will preside.

Canada.—FIRE INSURANCE.—Fire insurance companies in Canada are endeavouring to ascertain the part played by wireless in homes as a factor in increasing fire losses. American fire insurance companies have already made a slight increase

in premium to offset the additional risk of lightning and short-circuiting household wiring through tampering. Canadian companies, it is believed, will shortly follow suit.—*Reuter* (Ottawa).

Germany.—LICENCES.—There are now 838,904 radio receiving licences in operation throughout Germany. The licences are issued by districts; that of Berlin heads the list with 353,229, followed by Hamburg with 116,263, Leipzig with 102,014, Munich with 88,155, Frankfort-am-Main, 64,271, Breslau, 46,503, Munster, 27,380, Stuttgart, 26,819, and Konigsberg, Prussia, 14,270.

India.—BROADCASTING SCHEME.—The probability that within five years India and Ceylon will be equipped with ten broadcasting stations was suggested by Captain John Eaton Monins, of Burndept, Ltd., in an interview with a *Daily News* representative before his departure for India in connection with a wireless project. "Behind the scheme are four famous English wireless companies," he said. "Indian capital will also be interested. Already application for the requisite licences has been made to the Indian Government. At present India possesses only two small private broadcasting stations, at Calcutta and Bombay. First steps in the scheme will be to convert those into standard stations, and to erect one at Madras. Local relay stations will be set up to serve the different speaking territories."

S.B. Relaying.—NEW SWITCHBOARD.—A new switchboard is being erected at the Savoy Hill headquarters of the British Broadcasting Co. to enable 2LO programmes to be supplied to any of the Company's studios that cares to insert a plug in a socket at its own studio. Between London and Leeds four special lines have been set apart by the Post Office for the use of the B.B.C. Thirty amplifiers, each using three valves, will automatically feed the lines with the London programmes, says the *Daily Mail*, and it will thus be possible for 20 stations to receive the programmes, cutting out when they wish to broadcast their own.

The Philippines.—AMATEUR'S FEAT.—Amongst the recent achievements of Mr. F. A. Mayer, the well-known Essex amateur, was the establishment of communication with the Philippine Islands on November 9th between 2.30 and 4 p.m. G.m.t. This was the first two-way communication between this country and those islands. Mr. Mayer (G 2LZ) worked with Pi-IHR at Manila, which was in charge of Sig. Officer Hayden P. Roberts at Fort McKinley, the operator being Master Sergt. Angel D. Maningas, 12th Sig. Co., of the U.S. Army. Mr. Mayer used about 400 watts at the time on two T/250-type Osram valves, and his signals were reported to be strong and very steady, pure c.w. note, and the Manila signals were also very strong on two valves. The remarkable fact is that the communication took place in broad daylight on the 40-metre band; the signals faded out at sunset.

United States.—NATIONAL RADIO CONFERENCE.—The fourth National Radio Conference, convened by the Secretary of Commerce, Mr. Hoover, met at Washington on November 9th. The prospect that the Conference will determine whether wireless broadcasting is to be brought under Federal regulations, on the grounds of being a public utility, attracted many who would otherwise have stayed away. In his opening address to the delegates, Mr. Hoover indicated how far he was prepared to go in urging Federal legislation, and members of the committees of the Senate and House of Representatives, which will deal with such legislation, have accordingly been invited to attend the conference. The experimental work of the last two years, it is stated, has shown definitely that the limit has been reached in the number of first-class broadcasting stations, and measures will be discussed with a view to the reduction of the number of stations.—*Reuter* (Washington).

According to *The Times*, Mr. Hoover said that there were 578 broadcasting stations in the United States, of which 197 used at least 500 watts. The construction of a good modern station cost over $150,000 (£30,000), while the annual cost of running it, including artists' fees, approached $100,000 (£20,000). Of the new stations constructed this year, 32 used 1,000 watts, 25 used 5,000 watts, two used still higher power. Thus the range of non-interference between stations using the same wave-length was decreasing. With only 89 wave-lengths available for broadcasting, and more than 175 applications pending for new licences, the time had clearly arrived to abandon the policy of freedom of the air. The policing of the ether traffic should obviously be a Federal responsibility, but he would prefer that local communities should decide who was to use the wireless channels, in order that the public might more easily secure the elimination of undesirable features from broadcast programmes. To-day advertising provided the broadcaster's principal revenue, but freedom of speech in the air should not mean licence to individuals and firms to monopolise a listener's set with details about their business and descriptions of their wares. It was in the public interest that the new art should be developed to national advantage.

At a previous gathering the National Broadcasters' Association, reversing completely its attitude of a year ago, adopted a resolution recommending that full authority over the issuing of licences should be vested in the Department of Commerce. It was also resolved that the Copyright Law should be amended so as to fix a reasonable fee to composers for the broadcasting of their compositions and that no limitation should be placed on advertising.

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicate the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Australia. — MELBOURNE. — December 15th. Postmaster-General's Department. Junction apparatus for manual exchanges.*

December 29th. Magnet and resistance wire.*

SYDNEY.—February 1st. Municipal Council. Bunnerong power house equipment. Six 25,000-kW turbo-alternators, 1c 100,000 lb. per hour boilers, &c., and 33,000-V switchgear (November 10th.)

Belgium.—December 3rd. Municipal authorities of La Gileppe. Equipment of a small hydro-electric station. Specification may be inspected at the office of the Distribution d'Eau at Verviers.

December 11th. Belgian Ministry of the Colonies, 7, Place Royale, Brussels. Wireless telegraphy transmitting and receiving apparatus for the Belgian Congo stations. Particulars on application from Cahier des Charges No. 1,049.

Bridlington.—December 7th. Electricity Department. One oil engine, direct coupled to a 275-kW d.c. generator, fuel storage tank, cooling tower, pipework, and pumps. (November 10th.)

Bristol.—November 23rd. Port of Bristol Authority. Electric lighting installation, Dock office extensions. Mr. H. T. Sully, consulting engineer, 28, Baldwin Street (returnable deposit of £2 2s.).

Cheadle and Gatley.—November 23rd. Urban District Council. Switchgear cubicle and transformer and switchgear kiosk. Specification from Electrical Manager, 37, High Street, Cheadle.

Dublin.—December 10th. Great Southern Railways Co. Stores for six months, including electric lamps, &c. Stores Superintendent, Inchicore, Dublin.

Egypt.—December 30th. Inspecting Engineer in London. Queen Anne's Chambers, S.W. Telegraph and telephone material and motor generator and telegraph apparatus.

ALEXANDRIA.—December 10th. Ministry of the Interior. Machinery in connection with the waterworks scheme at Mellawi, consisting of electric motors and centrifugal pumps, control panels, l.p. armoured cable, &c. (C.X. 1,796.)*

Exeter.—December 11th. Electricity Department. One 3,000-kW steam turbo-alternator and accessories. (See this issue.)

Glasgow.—The Corporation Health Committee is inviting offers for the erection of an electrical power station at Bellefield Sanatorium.

Hull.—November 23rd. Supply of 250 or 500 tons of tramway rails, with fishplates, &c. Form of tender from Mr. F. W. Bricknell, city engineer.

Telephone Committee. Bronze wire. (See this issue.)

India.—DELHI.—November 30th. Indian Stores Department. Sub-station equipment for Jaipur (comprising insulators, wire, l.p. cable, switchgear, transformer, &c.).*

London.—METROPOLITAN ASYLUMS BOARD.—December 2nd. Renewal of electric cables, &c., at the Brook (Fever) Hospital, Shooters Hill, Woolwich, S.E.

ISLINGTON.—December 17th. Electricity Committee. One 75-kW a.c. motor and d.c. generator, with starters, switchgear, &c., and three 5,000-kVA Scott-connected transformers, &c. (See this issue.)

H.M. OFFICE OF WORKS.—December 3rd. Electrical accessories.*

Manchester.—November 23rd. Tramways Committee. Iron and steelwork required at tramcar depôt, Birchfields Road, Fallowfield. Particulars from City Architect, Town Hall.

November 25th. Electricity Committee. Constructional steelwork for garage, Polyon depôt, Tower Street, Ardwick. Specification (No. 130) and form of tender from Mr. H. C. Lamb, manager, Electricity Department, Town Hall.

November 30th. One electrical storage testing battery for testing depôt, Polyon, Ardwick. Specification from Mr. H. C. Lamb, manager, Electricity Department, Town Hall.

Marlborough.—Borough Council. Conversion of 62 street lamps from gas to electricity, including connecting up to existing mains. (See this issue.)

New Zealand.—WELLINGTON.—January 19th, 1926. Public Works Department. 50,000- and 110,000-V switchgear and steelwork for the Waikato electric power scheme. (B.X.2,157.)*

January 26th. 50,000-V switchgear for the Waikato electric power scheme; transformers for the Lake Coleridge power scheme.*.

GISBORNE.—Borough Council. Diesel engine, alternators, and auxiliary plant, rotary converter, and switchboard. (November 10th.)

Oldham.—December 5th. Electricity Department. Eight water-tube boilers, with superheaters, chain-grate stokers, steel chimneys, and induced draught plant. (November 6th.)

Peterborough.—November 30th. Electricity Department. Buildings and civil engineering work, pulverised fuel equipment, two boilers and boiler-house equipment, one 6,000-kW turbo-alternator and turbine-room equipment, e.h.p. and l.p. switchgear, &c. (November 10th.)

Southall.—November 24th. Southall-Norwood U.D.C. Overhauling and maintaining the fire-alarm system. (November 10th.)

South Africa.—JOHANNESBURG.—December 14th. Electricity Supply Commission. Plant and material for transmission lines and sub-stations in connection with the supply of electricity in the Cape area rural districts.*

December 23rd. Union Tender Board. Telephone apparatus and supply of telegraph material for the Department of Posts and Telegraphs.*

December 17th. Municipal Council. 2,000-kW motor converter. (B.X. 2,142.)*

CAPE TOWN.—December 3rd. Electricity Department. Three-phase induction voltage regulators.*

Sub-station plant and transmission lines. (B.X. 2,139.)*

FORT BEAUFORT.—December 10th. Municipal Council. Generating plant and materials for electric lighting.*

QUEENSTOWN.—January 7th, 1926. Municipal Council. Extensions to the electricity undertaking.*

Switzerland.—November 28th. Swiss Federal Railway Authorities, Berne. Two 3,000-kVA, 60/15-kV single-phase transformers and switchgear for the Mussaboden transformer station. Particulars for 5 fr. from the Abtheilung für Elektrifizierung, Zimmer No. 166, Dienstgebaude, 43, Mittelstrasse, Berne.

Thornton.—December 13th. Urban District Council Electricity Department. Supplying, laying, jointing, and coupling-up complete of an electricity supply system. (See this issue.)

Uruguay.—MONTEVIDEO.—January 18th. State Electricity Supply Works. 170,000 metres of r.i. cords.*

January 29th. Fuse wire, enamelled lamp shades, cut-outs, switches, lampholders, sockets, &c. (B.X. 2,126.)*

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Australia.—MELBOURNE.—State Electricity Commission of Victoria.—The Commission has accepted the tender of Weymouths, Ltd., for 40 transformers of from 200 to 500 kVA. The value of the contract is approximately £30,000). It has also been decided that Messrs. Weymouths, Ltd., shall supply the Commission's requirements in transformers during the next two years. The accepted tender was 14 per cent. in excess of the next lowest tender—that of a Swedish firm—which was inclusive of 50 per cent. *ad valorem* duty.

Glasgow.—Tramways Committee. Accepted: —
Steel tubing for mains.—Stewarts & Lloyds and Scottish Tube Co., Ltd.
Lead-covered cable.—Western Electric Co., Ltd.
Special trackwork.—Titan Trackwork Co., Ltd.

Irish Free State.—Contracts placed by the Controller of Stores, Department of Posts and Telegraphs, during October, 1925 :—
Batteries.—Pritchett & Gold and E.P.S. Co., Ltd.
Switchboard clocks.—Grimshaw, Baxter, and J. J. Elliott, Ltd.
Conduit and fittings.—Eureka Conduit & Fittings Co., Ltd.
Earth plates.—J. C. McLoughlin.
Switchboard cable.—Peel-Conner Telephone Works, Ltd.
Telephone wires.—McMillan & Co.
—*Irish Electrician.*

Lepton (near Huddersfield).—Urban District Council. Accepted :—
Installing electric lighting, exclusive of two-way switches, in the Council houses (£4 per house).—Electrical Distribution of Yorkshire, Ltd.

London.—UNDERGROUND ELECTRIC RAILWAYS CO. OF LONDON.—The company has placed orders with Cammell, Laird & Co. and the Metropolitan Carriage, Wagon & Finance Co. for 78 new cars required for service on the Morden and Kennington extensions, which will be ready for service next midsummer.

METROPOLITAN ASYLUMS BOARD.—Works Committee.
Automatic telephone installation at the Downs Hospital for Children :—

Commercial Telephone & Electrical Co., Ltd. (Recommended.)	**£748**
E. Shipton & Co., Ltd.	945
V. G. Middleton & Co., Ltd.	1,020
Reliance Telephone Co., Ltd.	1,064
Electrical Contracts & Maintenance Co. (1925), Ltd.	1,334

The following tenders were received for X-ray apparatus for the North-Eastern Hospital :—

Medical Supply Association, Ltd.	£283
Schall & Son, Ltd.	294
Watson & Sons (Electro-Medical), Ltd.	298
A. E. Dean & Co.	316
X-Rays, Ltd.	340
Newton & Wright, Ltd.	387

Manchester.—Tramways Committee. Accepted:—
Tramcar meters.—Chamberlain & Hookham, Ltd.
6-h.p. motor.—Smith & Coventry, Ltd.
5-h.p. motor.—W. T. Ellison & Co., Ltd.
Sample set of motor suspension gear for car trucks.—Brush Electrical Engineering Co., Ltd.

Richmond (Yorks.).—Town Council. Accepted:—
H.p. transmission line, sub-station equipment, and high-pressure network (£6,433).—Johnson & Phillips, Ltd.

Southend-on-Sea.—Town Council. Accepted:—
1,232 electricity meters of varying capacity (£3,097).—Chamberlain & Hookham, Ltd.

Winchester.—Town Council. Accepted:—
New boiler plant for the electricity works (£5,188).—Babcock & Wilcox, Ltd.

Forthcoming Events.

Electrical Trades Commercial Travellers' Association.—Saturday, November 21st. At the Manchester Hotel, E.C. At 7.30 p.m. Whist drive and social.

Nottingham Society of Engineers.—Monday, November 23rd. At the Victoria Station Hotel. At 7.30 p.m. Lecture on "A Factory Equipment," by Mr. M. A. Crosbie.

Shipping and Engineering Exhibition.—At Olympia. November 23rd to December 5th.

Royal Society of Arts.—Monday, November 23rd. At John Street, Adelphi, W.C. At 8 p.m. Cantor Lecture, "Coal Ash and Clean Coal," by Dr. R. Lessing.

Institution of Electrical Engineers.—INFORMAL MEETING.—Monday, November 23rd. At the Institution, Victoria Embankment, W.C.2. At 7 p.m. Discussion on "The Testing of Large Electric Plant," to be opened by Mr. E. E. Tasker.

(North-Eastern Centre).—Monday, November 23rd. At Armstrong College, Newcastle-on-Tyne. At 7 p.m. Paper on "The Engineer: His Due and His Duty in Life," by Mr. T. Carter.

(North Midland Centre).—Tuesday, November 24th. At the Hotel Metropole, King Street, Leeds. At 7 p.m. Paper on "The Engineer: His Due and His Duty in Life," by Mr. T. Carter.

(South Midland Centre).—Friday, November 27th. At the Grand Hotel, Birmingham. Annual dinner.

(London Students' Section).—Friday, November 27th. At the Institution, Victoria Embankment, W.C.2. At 6.15 p.m. Paper on "The Tungar Rectifier," by Mr. A. P. Hill.

(North-Western Centre, Students' Section).—Tuesday, November 24th. At Milton Hall, Deansgate, Manchester. At 7.30 p.m. Paper on "The Automatic Control of d.c. and a.c. Feeders," by Mr. C. Ryder.

Institute of Physics.—Wednesday, November 25th. At Burlington House, Piccadilly, W. At 5.30 p.m. Lecture on "The Physicist in Agriculture, with Special Reference to Soil Problems," by Mr. B. A. Keen.

South Wales Institute of Engineers.—Engineering exhibition at the Drill Hall, Cardiff. November 26th to December 3rd.

Junior Institution of Engineers.—Friday, November 27th. At 39, Victoria Street, S.W. At 7.30 p.m. Lecturette, "The Engineer and His Relationship to the Tea Industry," by Mr. E. Granville-Smith.

Institution of Mechanical Engineers.—Friday, November 27th. At the Institution, Storey's Gate, S.W. At 7 p.m. Informal meeting. Discussion on "The Work of the Mechanical Engineer in Non-Engineering Industries," to be opened by Mr. W. P. F. Fanghanel.

Institution of Engineering Inspection (Inc.).—Friday, November 27th. At the Hyde Park Hotel, London. Annual reception and presidential address, followed by a dance and concert.

Physical Society of London.—Friday, November 27th. At the Imperial College of Science, South Kensington, S.W. At 5 p.m. Ordinary scientific meeting.

The "Electrical Review" Service Department.

INQUIRIES must be accompanied by a stamped addressed envelope.

We should be glad to learn the names of makers or suppliers of :—
SIGLIT signalling lamps.
VAMPYX vacuum cleaners.
LOEWE resistances.

Notes.

Parliamentary.—The autumn session of the House of Commons opened on November 16th. The Prime Minister, in reviewing the programme, stated that it would be impossible to proceed with the Merchandise Marks Bill, and Bills to amend the Factory and Workshop Acts.

Mr. Baldwin informed Mr. Crawford that although the examination of the electricity proposals was proceeding, it had not reached such a stage as to enable him to announce the Government's plans. He hoped that he would be able to make a statement before the House rose. The delay which had occurred was due to the complexity of the subject.

London Traffic Inquiry.—The inquiry into the travelling facilities of North London was continued at the Middlesex Guildhall, Westminster, on November 10th and subsequent days. Mr. C. J. Spencer, general manager of the Metropolitan Electric Tramways, stated that the competition of independent omnibuses had put a stop to schemes for further development in the area served by the company. Mr. E. Pick, assistant manager to the Underground Group, stated that the underground railway at Finsbury Park was not used to its full capacity, and that during the past four years there had been a falling off in the number of passengers carried due to independent buses. There could be no tube developments in London until the surface transport was controlled.

Fatality.—An inquest was held at Dolgarrog on November 12th into the death of Michael Riordan, who was killed, while three other men were seriously injured, during the boring of a tunnel between Eigiau and Cowlyd Valleys, Carnarvon, for the North Wales Electric Power Co. It was stated that a charge failed to explode, but when the men went to examine it an explosion occurred. A verdict of "Accidental death" was returned.

Shipping and Machinery Exhibition.—The committee of the Shipping, Engineering, and Machinery Exhibition invites all visitors from overseas associated with the shipping, engineering, and machinery industries who happen to be in England on December 1st next to apply to Mr. F. W. Bridges, Avenue Chambers, Southampton Row, London, W.C.1, for complimentary tickets for the dinner to be given at the exhibition on that date in honour of oversea guests. Although a great number of invitations has already been issued direct by mail, the management is very anxious that all visitors from the Dominions and other parts abroad who may not have received invitations may do so.

Educational.—French Electrical School.—The foundation stone of the new buildings of the Ecole Superieure d'Electricité was laid by M. Doumergue, president of the French Republic, at Malakoff on November 9th. The old school, which was built in 1893, has become too small for the accommodation of the growing number of French and foreign students, who now number 225, which is the maximum limit. Thanks to subscriptions of 5,000,000 fr. by electrical firms, 4,000,000 fr. by the State, and 2,000,000 fr. by the city of Paris and the Council of the Seine, a total of 11,000,000 fr. has been collected, but an amount of 4,000,000 fr. still remains to be raised so as to provide the school with modern equipment. It is intended to complete the new buildings in 1927.

Poplar School of Engineering.—An Old Boys' Society has been formed for the purpose of bringing together old day students of the Poplar School of Engineering. Further particulars are obtainable from Mr. Thos. L. Farnes, hon. secretary, 140, Mitcham Road, East Ham, London, E.6.

Automatic Control of Railway Engines.—A radio-operated safety device that checks running locomotives automatically when danger looms ahead was recently given a successful demonstration over a 10-mile stretch of Pere Marquette railroad, U.S.A. By means of a system of radio-controlled signal lights installed in the engine cab, it was demonstrated that if the engineer is disabled, the system of control checks the engine's speed and brings it to a halt at any danger point, at any time. The working depends on the propagation of electro-magnetic waves flowing in the track rails with varying wave-lengths which operate on the visual signal device in the engine cab. The Michigan Central railroad has equipped ten locomotives and ten miles of track between Jackson and Rives, Michigan, with the Clark radio control device.—*Reuter* (Detroit).

The Lord Mayor's Show.—One of the features of this year's show on November 9th was the telegraph cable companies' effort to express what communications mean to trade. The great cable companies were represented by two cars. In one a boy messenger lay upon a rock, taking with outstretched arm a message from Neptune emerging from the seas. The other car held a great pasteboard globe with the cable routes traced on it, and at the corners stood a Chinaman, a gold miner, a rancher, and a Colonial sheep farmer, emblematic of Asia, Africa, America, and Australasia. John Bull drove the four horses which pulled the car.

The Finsbury Technical College Old Students' Association.—Annual Dinner.—On Saturday last the annual dinner of the Finsbury Technical College Old Students' Association was held at the Engineers' Club, London; over 100 members and guests were present, including ladies for the first time. Mr. E. S. Conradi, President of the Association, was in the chair. After the loyal toast, Lt.-Col. K. Edgcumbe, M.I.E.E., proposed "The College," and remarking that there was a cloud over it at present, he reviewed the circumstances under which its work had been carried on during the past four years, and paid a tribute to the extraordinary efforts that had been made by the special committee of the Council to secure its continuance. Finsbury owed its greatness to the personality of its professors. The committee had done its utmost and owned itself beaten; but was it not for the best that a great institution should be cut off in its prime, instead of eking out a precarious existence to an inglorious end?

Prof. A. J. Hale, F.I.C., Dean of the College, responded, expressing the feeling that the closing of Finsbury would mean the loss of something well worth keeping. Finsbury had never given degrees, which were so much sought after nowadays, but had trained men to be useful in industry very successfully for forty years; 3,000 students had passed through the College, of whom 2,000 were engineers, and 700 chemists. The Meldola Memorial Fund had provided them with a most useful library, and like the Streatfield and Thompson Memorial Lectures, was due to the Old Students. In view of the threatened closing of the College in its present form there was a strong feeling that it should be converted into a college of chemical engineering and applied chemistry, for which undoubtedly there was scope. That proposal was under consideration and might possibly be put into effect.

Mr. E. R. Bolton, F.I.C., proposed the toast "F.T.C.O.S.A.," and said that the College was a live body with a soul; if it was shut up the Old Students' Association would go on.

Responding, Mr. Conradi, after referring to the severe illness of Captain Wallis-Jones, to whom a telegram of sympathy was sent, described the work done by the Council and Committee, which had brought forth plenty of sympathy but no money. Mr. C. E. Elcock had been of great assistance in putting the facts before the Educational Trusts. Finsbury was going down with its flag flying; it had gained a wonderful reputation, and the Old Students would carry on its traditions. It was proposed that a Finsbury Scholarship should be founded, and he hoped that the Old Students would help in this.

Mr. R. W. Paul, M.I.E.E., proposed "The Guests" in a humorous speech. He did not feel depressed, for if the College did no more work it would live in memory. The College was really the men who had passed through it, and its spirit would continue. They would all do their best to help the Old Students' Association.

Mr. C. E. Elcock, F.R.I.B.A., responded, remarking that that was the pleasantest "wake" he had ever attended. He described his negotiations with the Educational Trusts and urged that the O.S.A. should itself form a Trust to assist technical education. Mrs. Price also briefly responded to the toast.

A capital entertainment was provided, and the President, in conclusion, expressed the gratitude of the audience to the musical director, Mr. L. M. Clark, and the hon. secretary, Mr. Grant, for their arduous and successful labours.

The Streatfield Memorial Lecture will be delivered on December 3rd.

A French 150,000-volt Cable.—The Société Générale de Force et Lumière has just laid an underground cable on the line Moutiers-Lyons of a length of 18 miles and having a service pressure of 150,000 volts to earth and capable of reaching 300,000 volts between the positive and negative conductors.

British Cast Iron Research Association.—We have received copies of the Quarterly Bulletin, No. 10, October, 1925, and the fourth annual report for the year ended June 30th, 1925 of the above Association. An article on "The Influence of Aluminium on Cast Iron" contains some interesting information with reference to high-resistance alloys. The annual report shows that at the end of the year the total membership of the Association was 275, compared with 248 at the end of the previous year. The income for the year was higher than that of any previous year, and for the first time reached the minimum originally stipulated by the Department of Scientific and Industrial Research (£2,500 per annum), as a qualification for the Government grant. Mr. H. B. Weeks, F.I.C., has been re-elected chairman of the Association for the ensuing year.

B.E.S.A. Specification.—The British Engineering Standards Association has issued a specification (No. 215, 1925) for hard-drawn aluminium and steel-cored aluminium conductors for overhead power transmission purposes. It is very similar in general lines to that for hard-drawn copper solid and stranded circular conductors, and gives full details of the number of strands, weight, resistance, tensile strength, &c., of the standard sizes of aluminium and steel-cored aluminium conductors. The standard sizes are based upon the standard sizes of hard-drawn copper conductors, there being an aluminium or steel-cored aluminium conductor of equivalent resistance to each primary standard size given in B.E.S.A. specification 125-1924. Some useful notes are given, explaining how the values in the various tables have been arrived at. One of the most interesting features of the specification is the appendix which gives the British standards of resistance of aluminium for electrical conductors. These standards have been agreed upon by the National Physical Laboratory and the Laboratoire Central d'Electricité, Paris, and constitute the first authoritative data on the resistance of aluminium to be published in this country. They are also being submitted to the International Electrotechnical Commission for adoption as international standards. Copies of the new publication may be obtained from the B.E.S.A. Publication Department, 28, Victoria Street, London, S.W.1, price 1s. 2d., post free.

Lighting Service Bureau Lectures.—On November 9th, at the Lighting Service Bureau, 15, Savoy Street, Mr. Beauchamp, of E.D.A., gave the first of a series of educational lectures which have been specially arranged for women working in the electrical industry and a number of prospective lecturers for the Electrical Association for Women. Mr. Beauchamp traced the journey of 1¾ lb. of coal through its conversion into electricity and eventually into the house of the consumer. The next lecture was to be held on November 16th, and the third will be given on November 30th. All showroom assistants and other women working in the electrical industry are invited.

Illuminated "White Line."—The first illuminated "white line" for the guidance of traffic round dangerous corners was tested on the North Circular road at Hendon, where it joins Golders Green Road. According to the *Daily Mail*, it was visible 200 yards away to motorists, who slowed down when they saw it and kept well on the proper side of the road. The line, which is the invention of Mr. R. F. Brown, a surveyor, of Great Clacton, Essex, consists of alternate pieces of glass and white tile an inch wide inserted flush with the road surface. Beneath this is watertight iron casing through which runs a line of electric light bulbs. The power is supplied from the electric main at the side of the road. The lamps are lit automatically and put out at daybreak.

Cable Ship in Distress.—The cable ship *Lord Kelvin* reached Queenstown on November 10th after an ordeal in an Atlantic gale, as reported in our last issue.

Medical Colour Treatment.—Dr. J. Dodson Hessey, writing in a recent issue of the *Practitioner* on the subject of colour treatment for certain diseases, states that he has had successful results with such treatment. The three most useful colours are green, blue, and orange, and the treatment is given by means of a 1,000-candle-power lamp; the patient wears a minimum of clothing, preferably a white gown.

Fuel Research Board.—The report of the Fuel Research Board (Stationery Office, 3s. 6d. net) for the period ended December 31st, 1924, is the first to be presented since 1920, and it covers the work of the intervening five years. Signed by Mr. C. H. Lander, who succeeded the late Sir George Beilby as Director, the report indicates that, owing to the increased volume of work now undertaken at the Fuel Research Station at East Greenwich and elsewhere, it is intended in future to prepare an annual report to assist those who are interested in keeping in touch with the various developments.

Progress in Electrodeposition.—In the course of an address entitled "Recent Advances in Electrodeposition" to the members of the Sheffield Section of the Institute of Metals recently, Mr. S. Field said the processes of electrodeposition were permeating many industries. New and surprising methods had been introduced, and some remarkably skilful work had been achieved. Organised research work was in progress in a number of laboratories. The scope of this work in this country was, however, much more limited than in America, where organised research on a large scale was in progress. In this country, too, there had been a lack of organisation amongst those engaged in the processes of electrodeposition. Nearing, as we were, the centenary of the enunciation of the fundamental laws of electrolysis, there was at least some prospect of rectifying these omissions and of more rapidly building on the foundations which were so well and truly laid by Michael Faraday in 1833, the pioneer in the realm of scientific electrodeposition.

Steam Pan Explosion Report.—We have received a copy of the report of a preliminary inquiry into the explosion of a steam jacketed pan, which occurred at the works of Messrs. W. T. Henley's Telegraph Works Co., Ltd., in June last. The explosion was violent, but owing to the connecting pipe being well secured to the inner and outer bottoms the steam escaped from the jacket through the annular opening around the top of the jacket without completely ejecting the inner pan. The pan was originally fitted with three screwed stays at the bottom, but these were omitted when a repair was made. Grooving of the weld at the top flange was set up by panting owing to the omission of the stays, and the plate failed ultimately at the wasted part.

Continental Automatic Sub-Stations.—In our issue of October 23rd, in an article on automatic and remotely-controlled rotary converters manufactured by the Metropolitan-Vickers Company, two 1,000-kW automatic sets at Copenhagen were referred to as "the only automatic ones on the Continent of Europe." We are informed that a completely automatic rotary converter equipment was installed by the Swiss Brown, Boveri Co. at Riehen, near Basle, as far back as the autumn of 1919. This equipment, which supplies the local Basle-Lörrach tramways, has, we understand, operated continuously and faultlessly ever since.

World Power Conference.—All the nations which are members of the World Power Conference have been invited to be represented at a sectional meeting in September of next year, in connection with the International Waterways and Hydraulic Power Exhibition. The agenda includes discussions on the application of electricity to agriculture, the electrification of railways, and the exchange of electric power between different countries.—*Reuter* (Basle).

Particulars of the proposed meeting at Basle were given in the ELECTRICAL REVIEW of September 25th, p. 505.

Electroplaters' and Depositors' Technical Society.—A Society with this designation, the latest concerned with technical applications of electricity, was founded at an inaugural meeting held at the Northampton Polytechnic Institute, Clerkenwell, on November 11th, over which Mr. S. Field presided.

The Principal of the Institute having addressed a welcome to those present, the chairman stated that the need had long been felt for a society in London where electroplaters and electrodepositors could discuss their problems and where they could come into contact with those engaged in research work on electrodeposition. Such contact could not fail to benefit both parties. The skilled plater possessed a fund of experience and empirical knowledge with which the "scientific" electrochemist should be acquainted, while the methods and results of the laboratory research worker could not fail to be useful to the practical plater when put to him in language which he could understand. A society of this character already existed in America, and there were local societies in Birmingham and Sheffield where plating problems were discussed.

Mr. F. S. SPIERS, who spoke on behalf of the Faraday Society, said that Society was greatly interested in the movement which had culminated in the present meeting and it was at the instigation of its Council that a Committee had been formed to consider the best lines on which an electroplaters' society should be constituted. It was at first thought that a special plating section of the Faraday Society would serve the purpose, but there were many weighty objections against that course, and the conclusion was reached that the needs of the plater could only be met by the formation of an independent group or society. The Faraday Society was, however, desirous of associating itself with the new body and the Council had agreed to the proposal to nominate representatives on its Committee. The new Society would cover the whole field of electrodeposition, which now included not only metals such as gold, silver and nickel, which were usually associated with the term "electroplating," but also zinc, iron, copper, cobalt, chromium, lead, tin, and other metals, all of which were now being industrially deposited.

Mr. D. J. MACNAUGHTAN, of the Research Department, Woolwich, expressed his belief that the proposed Society would help to break down the barriers at present existing between the practical plater and the research worker, and Mr. W. JAMES, speaking on behalf of the plating industry, endorsed this view. Platers were fully alive to the need for adopting the latest scientific knowledge in the practice of their art. In particular they would respond very heartily to the inspiration which they would derive from association with the name of "Faraday."

The resolution, by which the Society was formally created, was moved by Mr. S. FIELD and seconded by Dr. R. S. HUTTON, director of the British Non-Ferrous Metals Research Association. A Provisional Committee to frame rules and inaugurate the work of the Society was then elected, consisting of Messrs. S. Field (chairman), W. James (treasurer), L. Goring, W. F. Pitcher, F. S. Spiers, J. S. Sunderland, who represents electrotyping interests, and W. E. Harris, honorary secretary. The representatives of the Faraday Society were Mr. Field, Mr. Spiers, and another, who would be nominated later.

The Society will probably hold two types of meetings; those at which papers will be read and discussed and which will be open to visitors, and informal discussions, of which no report will be published, open to members only. It is intended to offer the papers read for publication in a suitable trade journal and consequently a subscription of 5s. per annum, with a reduced subscription for learners and improvers, is likely to suffice to cover working expenses. The first ordinary meeting of the Society will be held on December 9th at 8.15 at the Northampton Polytechnic Institute, when an inaugural address will be given by Mr. S. Field, which is expected to deal with recent progress in electrodeposition.

Appointments Vacant.—Plumber-jointer, for the Great Yarmouth Corporation electricity and tramway departments; assistant sub-station attendant, for Stoke Newington Borough Council electricity department; charge engineer, for the Tunbridge Wells Corporation electricity department. (See our advertisement pages to-day.)

Institution Notes.

Institution of Electrical Engineers.—INFORMAL MEETING.—At the meeting of the Informal Section on Monday, November 9th, Mr. E. S. Ritter opened a discussion on "Modern Developments in Telephone Cables." He had spared no pains in the preparation of numerous charts and diagrams, and these were examined with great interest by a number of those present. His survey was not historical so much as a description of and summary of the results achieved to date, and an illustration of the difficult problems that telephone transmission offers in comparison with those of power transmission. He described the underground line from London to Glasgow, with its five repeater stations along the route, produced samples of the most recently constructed cables, describing their construction, and testified to the skill of British cable makers in attaining and even surpassing the rigorous standards of capacity and deviation prescribed by the Post Office. Fifteen speakers joined in the subsequent discussion and more than one urged the need to co-relate the terminology and adopt standard terms and definitions, now that interlinking with the Continent is in view.

SCOTTISH CENTRE.—Prof. Magnus Maclean, M.A., D.Sc., delivered his inaugural address as chairman of the Centre at Glasgow on November 10th. Dr. Maclean was largely instrumental in getting the Scottish Centre formed, and this is the second occasion on which he has acted as chairman. His address was devoted to the early history of the Centre and its activities.

Junior Institution of Engineers.—NEW OFFICERS.—At the annual general meeting held on November 13th, the following officers were declared elected:—Chairman, Mr. A. J. Simpson; vice-chairmen, Messrs. R. L. Kirlew and C. E. Atkinson; hon. treasurer, Mr. C. O. Hourant; hon. librarian, Mr. T. W. P. Mullings.

National Association of Supervising Electricians.—FORTHCOMING EVENTS.—On Tuesday, December 1st, at the Junior Institution of Engineers, 39, Victoria Street, S.W., Mr. F. Hope-Jones will deliver his lecture on "Electric Time Service," in place of the lecture on "Research in Cable Industry" by Capt. P. Dunsheath, who will give his lecture on April 6th, 1926.

Royal Institution.—CHRISTMAS LECTURES.—The hundredth annual course of Christmas lectures for juveniles will be delivered by Sir William Bragg, on "Old Trades and New Knowledge." "The Trade of the Sailor" is the title of the first lecture on Tuesday, December 29th, and the following five lectures will be on the trades of the smith, the weaver, the dyer, the potter, and the miner.

Institution of Structural Engineers.—EXAMINATION.—We have received a syllabus of the examination of the Institution, which comes into force from January 1st, 1926. It sets forth qualifications which exempt candidates from the examination for the various classes of membership. From January 1st, 1926, admission will be by examination or exempting examinations only, but applications for direct admission from candidates having practical experience can be accepted up to that time.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.)

Captain A. Angers, A.M.I.E.E., F.R.M.S., of Messrs. A. Angers & Co., electrical, &c., engineers, Liverpool, who has been laid up for the past six months suffering from double pneumonia, has sufficiently recovered to be able to leave his room. He desires to thank many friends for their letters of sympathy. Mr. Angers, who has been a member of the Liverpool City Council for the past four years and a member of the Electric Light Committee, stood in the recent municipal election as Conservative candidate in a three-cornered fight and secured a large majority though unable to conduct the campaign personally owing to his illness.

Mr. J. Hillier French, who has for about four years been chairman of the Works Committee of the Maidstone Corporation Electricity Committee, has been presented by the members on his retirement from the Town Council with an inscribed barometer, and by the employés of the electricity works with a silver fruit dish.

Mr. C. E. Wood, who has for some years been chief of the accountancy department at the Stamford Electricity Works, has been appointed manager of the works in succession to Mr. C. L. Holman.

The *Daily Telegraph* states that Mr. Kenneth Belben Anderson, who died at Camberley on Friday last, was a director of the Exchange Telegraph Co. and a grandson of Sir James Anderson, formerly managing director of the Eastern Telegraph and allied companies, and was associated with Sir John Pender in the pioneer work of submarine telegraphy.

The presentation of a gold watch and fob to the general manager, Captain W. Vane-Morland, and of a case of afternoon tea knives to Mrs. Morland, prior to their departure for Walsall, was made by the staff of the St. Helens Corporation Tramways, last week.

Captain F. C. Burstall, of the Liverpool telephone service, has been appointed telephone traffic manager to the Egyptian Government, to whom he has been loaned by the Post Office authorities for a period of three years. Capt. Burstall entered the service of the National Telephone Co. in 1904 and was one of its divisional traffic superintendents.

Alderman Wilfred Turner, chairman of the Bradford Corporation Electricity Committee for many years past, has relinquished the chairmanship for the new municipal year owing to his appointment as Deputy Lord Mayor. The chairman of the Electricity Committee for this year is Councillor J. W. Longley, hitherto vice-chairman, and himself a consulting engineer.

Councillor H. Foulstone, who has been installed as Mayor of Barnsley, has, as chairman of the Electricity and Lighting Committee, done much to assist in the development of the electricity undertaking, and enthusiastic reference to this was made at last week's ceremony.

Councillor W. Tummon has been re-elected chairman of the Sheffield Electric Supply Committee, and Alderman Styring the deputy chairman.

Sir Charles J. Stewart and Mr. H. Morgan have resigned from the Board of Marconi's Wireless Telegraph Co., Ltd., and Sir Frederick J. Barthorpe, D.L., late chief joint general manager of the London County and Westminster Bank, Ltd., and Sir William Slingo have been appointed to fill the two vacancies.

Mr. H. K. Beale has been re-appointed chairman of the Birmingham Corporation Electric Supply Committee.

The South African Power Engineer states that Mr. H. M. S. Muller, of Lindley, O.F.S., has been appointed electrical engineer to the Municipality of Beaufort West, and that Mr. Stakesby Lewis, previously engineer of Frankfort, O.F.S., has been appointed engineer of Aliwal North.

Mr. P. S. G. Redfern has been appointed salesman on the staff of the Birmingham branch of Messrs. Johnson & Phillips, Ltd. For some three years he has been associated with the Telephone Manufacturing Co., Ltd., in the same district. Mr. A. L. Vine, who has for some time been associated with Messrs. W. T. Henley's Telegraph Works Co., Ltd., in North Wales, has been appointed salesman on the staff of the Portsmouth branch of Messrs. Johnson & Phillips, Ltd.

Alderman A. A. Thomson and Alderman G. J. Allen, J.P., have been elected chairman and vice-chairman, respectively, of the Croydon Corporation Tramways Committee.

Obituary.—Mr. A. C. Devey.—Our readers will learn with regret of the death of Mr. Arthur Charles Devey, which occurred about a month ago at Boulogne at the age of 58 years. Mr. Devey, who was the youngest son of Mr. C. H. Devey (late Master of the Vintners' Company and twice Master of the Founders' Company), was born on November 11th, 1866, and was educated at Westminster and Tonbridge Schools. He early became an electrical engineer, and it is said was one of the first to install electric light in a private house. After some time in France, Belgium, and Italy, Mr. Devey joined the British Insulated & Helsby Cables, Ltd., of Prescot, and was with the company for many years, making numerous friends in the electrical world. Ill-health compelled him to retire several years ago, a pension being granted as a token of esteem—a mark of appreciation which he highly valued. During the war he rendered splendid service to the cause in both France and England. Here he was a member of the National Guard, and as in so many other cases where men who had passed the period for most strenuous activity worked on Saturdays and Sundays as well as through the week; he paid the penalty in a complete breakdown of his health. It was while thus suffering that he was suddenly taken with appendicitis and peritonitis. Two operations were performed and he bore these with such fortitude that the Hospital authorities wrote of "*son courage et douce sérénité*," but on the third day he passed away at Boulogne-sur-Mer. His home was at Wimereux, where he had lived for seventeen years. Mr. Devey was a member of the Institution of Electrical Engineers and of the Founders' Company.

Mr. S. Dean.—The death occurred recently of Mr. Samuel Dean, who was the first electrician at Port Sunlight (Lever Bros., Ltd.), when the original installation was set up 35 years ago.

Mr. H. V. Higgins.—Mr. Harry Victor Higgins, who was one of the victims in the flood disaster at Dolgarrog, was an electrical engineer. He was 30 years of age, and served his apprenticeship with Messrs. J. B. Saunders & Co., of Cardiff and Welshpool. Subsequently he became a linesman with the North Wales Power Co., and about a year ago he was transferred to the Dolgarrog power station.

Brig.-Gen. R. Marr-Johnson.—We regret to announce the death of Brigadier-General R. Marr-Johnson, C.M.G., D.S.O., which occurred on November 15th, after a serious illness, following an operation. General Johnson was a director and deputy-chairman of the Radio Communication Co., Ltd. He joined the board of that company after the completion of a brilliant military career in the Royal Regiment of Artillery.

New Companies Registered.

Polar, Ltd. (209,561).—Private company. Registered November 9th. Capital, £100 in £1 shares. Objects are: To adopt an agreement with the Radio Communication Co., Ltd., to acquire the trade mark "Polar" (registered No. 460,152 at the British Patents Office, Trade Marks Branch), and to carry on the business of agents, concessionaires for general or radio engineers, manufacturers and suppliers of and dealers in radio apparatus, &c. The subscribers (each with one share) are:—B. Binyon, Harthorndene, Hayes, Kent, company director; G. D. Cyanue, A.M.I.E.E., Fordcombe, Tunbridge Wells. The first directors are to be appointed by the subscribers. Qualification, £1. Remuneration as fixed by the company. Solicitors: Amery, Parkes & Co., Effingham House, Arundel Street, W.C.2.

Cutting Bros. & Co., Ltd. (209,526).—Private company. Registered November 7th. Capital, £22,000 in £1 shares (10,000 7 per cent. first cumulative preference, 10,000 7 per cent. second non-cumulative preference, and 2,000 ordinary). Objects: To carry on the business of electrical engineers and contractors, electricians, manufacturers of and dealers in wireless apparatus of all kinds, &c., and to adopt an agreement with T. W. Jourdan, C. H. Cutting, and G. H. Cutting. The first directors are:—T. W. Jourdan, Alsabrook House, Tiverton, Devon; C. H. Cutting (managing director), Austin House, Stamford, Lincs.; G. H. Cutting, 8, Rutland Terrace, Stamford, Lincs. Qualification, £300 shares. Remuneration, £150 per annum, divided between them. Secretary: G. H. Cutting. Solicitors: W. A. G. Davidson & Co., Bank Buildings, Acton, W., and Wembley Hill, Middlesex. Registered office: Park Works, Stamford, Lincs.

Hiberian Gas and Electric Investment Co., Ltd. (209,536).—Registered as a private company November 7th with a nominal capital of £500 in £1 shares. The objects are:—To acquire and to receive and hold on deposit as nominees or trustees and deal with shares or interests in any gas or electrical undertaking in Spain, Portugal, and their respective colonies, protectorates and dependencies, &c. Mortgages and charges, £245,000.

John Collier & Co. (Electrical Engineers), Ltd. (174,260). -Capital, £20,000 in 12,000 "A" and 8,000 "B" shares of £1 each. Return ated October 16th, 1925. All shares taken up. £2 paid. £19,998 considered s paid. Mortgages and charges, nil.

Baynes Electrical Co., Ltd. (176,835).—Capital, £2,000 n £1 shares. Return dated October 26th, 1925. 213 shares taken up. £213 aid. Mortgages and charges, nil.

Edward Dewhurst, Ltd. (177,199).—Capital, £20,000 in 1 shares. Return dated September 7th, 1925. 15,672 shares taken up. 1,502 paid. £14,170 considered as paid. Mortgages and charges, nil.

Ayling & Co., Ltd.—Debenture dated October 23rd, 1925, o secure £600, charged on the company's undertaking and property, present nd future, including uncalled capital. Holder: J. W. Heaps, 12, London Road, Clapton, E.5.

City Notes.

Reports and Meetings of Electrical Companies, Dividend Results, &c.

Electric Supply Co. of Victoria, Ltd.

The directors' report for the year ended March 31st last, shows a gross profit of £50,020 as compared with £42,999 in the preceding year. After providing for taxation and reserve for premium on debenture stock, there was a balance to the credit of the profit and loss account of £42,333. To this was added £59,142 brought forward, making £101,475. Debenture and note interest, &c., absorbed £25,105, and it was proposed to deal with the balance £76,370) as follows:—Writing off preliminary and formation expenses, £8,757; preference dividend for the year, £10,500; dividend of 10 per cent. on the ordinary capital, £12,500; carried forward, £44,613. The additional generating sets referred to in the last report have been installed at Ballarat and Benligo, but they only came into full operation in January last. The electricity department recorded a growth in business, but the tramway department showed a decrease in the number of passengers carried. The meeting was held on November 12th.

India Rubber, Gutta Percha, and Telegraph Works Co., Ltd.

In their report for the year ended August 31st, 1925, the directors submit accounts showing, after making provision for doubtful debts and income tax, a net profit of £108,482, plus £21,975 brought forward, making £130,457. The preference dividend absorbs £12,500 and £60,000 is to be added to reserve fund, leaving a disposable balance of £57,957, out of which a dividend of 5 per cent., free of income tax, on the ordinary shares, is to be paid, leaving £20,457 to be carried forward. The improvement in the company's activities referred to in the last annual report continues, and the turnover of the year shows a steady and profitable increase. The work of the Submarine Cable Department and of the company's cable steamer, *Silvergray*, discloses a gratifying increase during the past year. The French factory, notwithstanding the difficulties referred to last year, has produced better results. There is reason for hoping that the improvement will continue. The reserve fund has been increased by £60,000 to £280,000. The directors have considered the desire expressed by shareholders at the last meeting, and have arranged that the warrants for the dividend on ordinary shares shall be payable on December 1st instead of January 1st. Annual meeting: November 26th.

New Issues.

Newcastle-upon-Tyne Electric Supply Co., Ltd.—The company is offering to its shareholders an issue of 550,000 ordinary shares of £1 each at par. The new shares are being allotted in the proportion of one to each six preference or ordinary shares held. They will rank for dividend as from January 1st, 1926. In the circular containing the offer, the company states that there has been a remarkable expansion in its domestic load. During 1924 3,200 new customers were added and a further 5,000 will be connected before the end of the current year. It is anticipated that no fewer than 12,000 new connections will be made next year. The same dividend as last year will no doubt be paid for 1925.

British Insulated and Helsby Cables, Ltd.—The directors propose to capitalise the sum of £333,333 from the reserves and distribute this in the form of ordinary shares to the present ordinary shareholders in the proportion of one new share to each three held. If this proposal is approved, the new shares will rank for the forthcoming final dividend.

Prospectuses.—*Auckland Electric Power Board.*—An issue of 2,500 debentures of £100 each was offered by the Board last week, and letters of allotment have been posted. The price of issue was £98 and the debentures bear interest at the rate of 5 per cent., and are redeemable in 1946 at par. Redemption will be provided for by a sinking fund, and the Board is empowered to raise a special rate, if necessary, to secure the debentures. The proceeds are, in the words of the prospectus, "to provide funds for water-power conversion and general extension purposes in connection with the Board's electricity undertaking in and around the City of Auckland."

Government of Tasmania.—An issue of £600,000 of 5 per cent. registered stock at £98 per cent. was offered early this week by the Government of Tasmania. The proceeds are required for hydro-electric and other public works. The principal is repayable at par in 1975, or, at the option of the Government, at three months' notice, in 1945. The interest will be free of Tasmanian taxes.

Lancashire Electric Light & Power Co., Ltd.—On Wednesday last this company issued a prospectus offering 187,500 seven per cent. cumulative participating preference shares of £1 each at 23s. 6d. per share, and 371,440 ordinary shares of £1 each at 22s. 6d. per share. The proceeds are to be devoted to the repayment of moneys borrowed and expended on the development of the company's system, including the Padiham station and the installation of transmission lines, &c.

Companies to be Struck off the Register.—The names of the undermentioned companies will be struck off the Register at the expiration of three months unless cause is shown to the contrary:—

Anode, Ltd.
Boulton Magnetos, Ltd.
British East Africa Power Development Co., Ltd.
Central Electric (Handsworth), Ltd.
Christian Bergh Electric Co., Ltd.
Hightensite, Ltd.
Lightning Valve Co., Ltd.
Metallic Electrodes, Ltd.
Scott Electrical Co., Ltd.

Stock Exchange Notices.—Dealings in the following have been specially allowed by the Committee under Rule 159:—

South-Eastern Power and Light Co.—$13,668,900 6 per cent. gold debentures, series "A" (bearer) (temporary certificates); 273,378 option warrants to purchase new common stock at $50 per share.

Application has been made to the Committee to allow the following to be officially quoted:—

Shawinigan Water and Power Co.—$2,000,000 capital stock.

German Loan in America.—Last week the Rhenish-Westphalian Electricity Works Co. offered in New York $10,000,000 of direct mortgage 7 per cent. gold bonds, due 1950, at 94. It is reported that the loan was immediately oversubscribed.

Dorman, Long & Co., Ltd.—In declaring a dividend on the 6 per cent. cumulative preference shares for the six months ending December 31st next, the directors state that no dividends are to be paid on the 8 per cent. non-cumulative preferred ordinary and the ordinary shares.

Associated Gas and Electric Co.—The report for 1924 shows a net income of $1,005,757, and after deducting preferred dividends, fixed charges, &c., there was a surplus of $186,079. Material extensions have been made in the areas in which the subsidiary companies operate.

Adelaide Electric Supply Co., Ltd.—A final dividend of 6 per cent., free of tax, has been declared on the ordinary shares, making 12 per cent., free of tax, for the year ended August 31st last, as in 1923-24.

British Electric Traction Co., Ltd.—Interim dividends of 3 per cent. on the 6 per cent. preference stock and of 3 per cent. on the ordinary stock have been declared. Last year's interim ordinary dividend was 2 per cent.

British Thomson-Houston Co., Ltd.—Dividend on the 7 per cent. cumulative preference share capital of this company for the half year ending December 15th, 1925, less income tax at 4s. in the £.

Stocks and Shares.

MONDAY EVENING.

IN most markets of the Stock Exchange, business is much quieter than it has been of late. The remarkable rush of new issues, not only of rubber companies, but in other sections as well, tends to absorb a good deal of the floating supply of capital, though it exercises at present but little effect upon prices of existing stocks and shares. In the electricity departments, material strength is shown by most of the leading shares, and the recent outburst of strength amongst the issues of the equipment companies, cable and electrical, has not caused any particular selling on behalf of shareholders who must now have very substantial profits.

The Bournemouth & Poole company is making a curious offer to its shareholders in the shape of shares in the Richmond Electric Supply Co., Ltd. The curiosity of the offer lies in the manner of its making, and it is obvious that very careful thought has been given to the manner of effecting a distribution of shares in a way that shall be the most economical to proprietors in the companies concerned. Holders of Bournemouth & Poole should on no account miss the opportunity thus offered them for acquiring shares in a go-ahead concern, and at a price which is decidedly tempting. Bournemouth & Poole have risen to 3 ex rights and no doubt the issue of the Richmond shares affords the explanation for the advancing tendency of Bournemouths which has been a feature for the past few weeks. The Richmonds are offered at 24s., and the price is 6s. 9d. premium on the top of this.

In the London group, Chelseas are better at 2 and Kensingtons at 13. Edmundsons ordinary strengthened to 23s. 6d. Midland Counties, which have been quiet for some time past, are better at 22s. 9d. The Lancashire Light & Power Company is making a new issue this week of 7 per cent. cumulative participating preference at 23s. 6d. and of ordinary at 22s. 6d. Here, again, shareholders should see to it that they take advantage of the offer made to them, for the senior shares command a higher price in the market than that at which the new shares are offered, and the latter will be saleable at a premium.

The Hendon Electricity Supply Company is reorganising its capital and offers three new ordinary shares, for every ten held, at 46s. each. The present price of the existing shares is nearly £3. After this offer is completed, the company will make a bonus share distribution of 30 per cent., and the fortunate proprietors are to be congratulated upon the manner in which their company has been conducted to such a high state of prosperity.

The railway market is better, with Districts a feature of strength at 48, being 2 points up on the week. Underground Electric shares have been in demand, and, although the ordinary slipped back to 2⅜ after touching 2⅝, the 1s. shares at 8s. show a gain of a shilling. There is talk, very vague at present, of the long-expected reorganisation of the company's capital. When this is taken in hand, it is expected that some scheme will be formulated whereby both classes of shares may be brought within reasonable sight of a dividend.

The Siemens announcement of an interim dividend of 2½ per cent. led to some disappointment, for many people had been expecting at least 3¾ per cent. The price dropped abruptly to 33s., recovering later, however, to 34s. 6d., at which it shows a shilling fall on balance. The India Rubber Company has declared a dividend of 5 per cent., which also comes as a disappointment, but the company's increased profit figures are good enough to justify the anticipation that next year's report will show improvement in the dividend. The directors could have paid more this time, but have elected to fortify reserves at the expense of immediate return to proprietors. Brush rose 1s. to 25s. 6d., and Cromptons are 1/16 up at 13s. 9d. Electric Construction advanced to 34s. 6d. English Electrics at 20s. 3d. have risen to a slight premium, and Metropolitan-Vickers are better at 26s. 3d., on the announcement of important new contracts having been secured by the company. British Insulated fell back to 3⅝, after their recent very sharp rise. The rest of the shares in this division hold their ground.

New issue success is not confined to rubber companies. Auckland Electric Power Board offered 5 per cent. 1946 stock at 98, and the lists closed in a couple of hours from their being opened. In New York, prompt subscription followed upon an issue of ten million dollars Rhine Westphalia Electric Power 7 per cent. gold bonds at 94 plus interest. In contradistinction to these, it may be mentioned that the irrepressible Southern Counties Electric Light & Power Supply Company announces that the "subscription list is now open" for its preference, ordinary and debentures. The ordinary shares, by the way, are of the nominal value of a shilling, but are offered at 6s. Presumably there must be some people so simple as to apply for Southern Counties Electric descriptions, otherwise the things would not be pushed so persistently.

British Electric Traction went back a point, to 122½, although the interim dividend of 3 per cent. is 1 per cent. better than that of a year ago. Anglo-Argentine Tramways are better: Brazilian Tractions reacted. Mexicans remain rather irregular.

Cable stocks of the Eastern group display a robust tendency. Eastern ordinary, Eastern Extensions, and Westerns have strengthened. Globes hold their rise. Automatic Telephones are better at 51s. 3d., and International Automatics enjoyed a brisk jump to 33s. 6d. On the other hand, wireless shares are dull. Marconis have weakened to 26s. 3d. Two directors resigned last week, and their places are taken by Sir Frederick Barthorpe, D.L., and Sir William Slingo. It will be remembered that Sir William was engineer-in-chief of the G.P.O. during 1912-1919. Radio common gave way to 9¾ and the preferred to 9¼, following upon sales of shares induced by publication of the financial results of last quarter. Canadian Marconis drooped to 6s. 3d. It is semi-officially stated that there is no question of an amalgamation between the Canadian Marconi and the Radio Corporation of America.

With a fresh jump, raw rubber soared to 4s. 6d. per lb., revitalising the rubber share market and drawing fresh attention to the dividend possibilities that this price presages for shares in well-managed rubber companies. Other industrial sections are steady in the main. Babcocks keep hard at 51s. 3d., being regarded as one member of the quartette of sound iron and steel companies which are bound to benefit from any revival in the country's heavy trade.

Exports and Imports of Electrical Goods and Machinery in October, 1925.

A LARGE decline in the value of exported submarine telegraph and telephone cable (£411,820) was again responsible for a reduction in the total value of electrical exports during October. The fall as compared with the September figures was £172,761. Upon the whole, the position improved, for apart from the submarine-cable decrease, all items, with three minor exceptions, showed satisfactory increases. The principal actual improvement occurred in the case of unenumerated electrical machinery, the value of which rose by £89,076. Insulated wires and cables also made an appreciably better showing, being £51,054 above the September figures, and exported telegraph and telephone instruments and apparatus increased in value by £25,524. The best proportional increase was recorded for railway and tramway motors, £16,869. Comparing the figures with those for October, 1924, it is seen that the fall in submarine telegraph and telephone cable was responsible for the bulk of the decline in the total, although other items made large contributions: for instance, "other motors and generators," and telegraph and telephone instruments and apparatus. The only important increases upon the October, 1924, figures occurred in the cases of unenumerated electrical machinery, insulated wires and cables, and glow lamps.

Turning to the import section, it will be observed that only two items were lower in value than in the previous month; unenumerated electrical machinery fell heavily, being almost halved in value. The increases were roughly proportional, unenumerated electrical goods, telegraph and telephone apparatus, and batteries and accumulators being the outstanding items. The rise from the October, 1924, figures was fairly general, although batteries and accumulators were prominent in the list, with an increase of £50,513. The only items which declined to any extent were telegraph and telephone apparatus and unenumerated electrical machinery.

While the re-exports rose in value by £7,248 as compared with the September figures, they were £2,755 lower than in October, 1924. In this section, also, batteries and accumulators showed an increase. This is probably a manifestation of radio activity in preparation for the ensuing winter.

The Trade Position in Greece.

ACCORDING to a report by Mr. R. F. H. Duke, C.B.E., British Commercial Secretary at Athens (Stationery Office, 2s. net), the establishment of Parliamentary Government in Greece has led to a remarkable change, and the year 1924 may almost be regarded as a milestone in the economic development of the country.

As regards British trade, the situation has shown some improvement. The Government is beginning to realise the desirability of facilitating the investment of foreign capital in Greece and the co-operation of British industry in the development of the country. British firms have shown greater interest than was the case during the previous few years in Government contracts, both of a military and civil nature, and in public enterprises generally in Greece. There is no doubt that the Greek Government is most anxious to develop the country, and that many schemes of a productive nature can be undertaken with profit. The numerous public works schemes which were contemplated in 1921 and 1922 did not make much progress in 1923. The proposal of an American group to carry out irrigation drainage, hydraulic power and railway development has not reach a concrete stage. Tenders were invited for the exploitation of the Vladovo Falls on the river Vodo, to supply electric power to Salonika, but the scheme did not come to fruition. Recently proposals were submitted by a British group for the re-organisation of the electric light and power system of Athens and Piræus, including the extension of the Athens-Kephissia and Athens-Piræus railways, and to the Athens and Piræus tramway systems, involving an expenditure of some 3 million pounds. If the British firm is successful in carrying the scheme through, it should add very largely to British industrial prestige in Greece, and bring considerable employment to the engineering and electrical industries in Great Britain. The tender for the electrical distribution and the construction of tramways at Canea has been constantly postponed, and no decision has yet been taken.

The postal and telephone services are stated to be entirely inadequate. A British group in 1923 put forward a scheme for the installation and exploitation of an automatic telephone system which appeared to have prospects of success, but eventually the scheme was withdrawn and nothing more has been heard of it. Further invitation to tender for the supply of certain quantities of apparatus was issued in February last, but no decision has yet been reached. The telegraph service remains quite efficient, but proposals for the installation of general radio services have made no progress, and although a contract was signed between the Greek Government and the Marconi Co. in November, 1923, it has not yet been ratified.

The report recommends British firms to co-operate with merchants or capitalists of high standing in Greece. The complications of contract work, especially with the Greek Government, are such that without the assistance and advice of experienced Greek collaborators, foreign firms can hardly expect either to meet with success.

American Production and Prosperity.

A F.B.I. Report upon the United States.

Col. the Hon. F. Vernon Willey and Mr. Guy Locock, who recently paid a visit to the United States on behalf of the Federation of British Industries, have prepared a report containing a concise review of the factors operating in that country to-day. With regard to the prosperity of the United States it is mentioned that although the population is only 6.2 per cent. of the total population of the world, America produces 71.9 per cent. of the world's petroleum; 70.9 per cent. of the rubber; 60.2 per cent. of the pig iron; 52.7 per cent. of the copper; 57.8 per cent. of the telephone and telegraph material; and 82.7 per cent. of the automobiles.

It is stated that the general trend of business is highly satisfactory, and there is no indication of any slackening in the volume of trade. It is expected that next year will see all records broken, and that a prolonged period of prosperity is in front of the United States. Among the industries particularly mentioned in the report is the iron and steel industry, production in which took an upward turn in August this year. The weather has been generally favourable to the crops, and the prices obtained for agricultural produce are an important factor in the strength of the country's position.

As regards American production, it is reported that partly as a result of the war, enormous plant developments took place, and when the slump came there was widespread overcapacity. A remarkable recovery has been made towards maximum output. Whereas in 1921 the actual output was only 57 per cent. of the productive capacity, in 1923—the latest year for which figures are available—the ratio had risen to 71.8 per cent. and it is believed that since 1923 further progress has been made towards maximum output.

The financial position of the United States is undoubtedly sound, and the banking system established by the Federal Reserve Act has thoroughly justified itself. The position of banks and of industrial corporations is extremely liquid, due mainly to two causes; first, there is now comparatively little capital expenditure on plant, and, secondly, the financial burden of carrying large stocks has been greatly reduced owing to the policy of "hand-to-mouth" buying and direct sales to the consumer. The accumulated wealth of the United States is so great that the country will be driven by the force of circumstances, to follow increasingly a foreign investment policy. A table in the report shows that the United States investment in foreign countries was 1,445 million dollars in 1920—a phenomenal figure. In 1923 it had fallen to 444 million dollars, and in 1924 a rise to 959 million dollars was experienced. The most important American foreign investments are in the Latin-American countries, with Canada and Newfoundland second. So far as Europe is concerned, money has of late tended to flow towards government and municipal issues rather than towards productive enterprises, but the investigators believe that this point is not being lost sight of by American financial interests.

The domestic investment situation in the United States is remarkable for, first, the immense appreciation that has occurred in capital values, which it is considered is likely to be maintained; and secondly, enormous profits are being made in land deals. The increased capital values necessitate increased earnings. Normally it would have been expected that the influx of gold into the United States would have tended to raise prices substantially, but this has not been the case, as the producer found that if he raised his prices he would not be able to sell his products. This failure of American prices to rise, as predicted, is all the more remarkable in view of the enormous extension of the deferred payment system. The underlying explanation of this phenomenon is generally stated to be that the increasing efficiency of production in the United States has stopped a rise in price level, and that producers are holding their position by means of lower percentage profits and greatly increased output.

With regard to taxation, the report states that although it is difficult to accurately compare conditions in this country and the United States, it is probably right to say that American taxation is not more than 60 per cent. of the British, and a considerable reduction in Federal taxation is certain at the end of the present financial year, owing to the substantial surplus which will be shown. It is stated that although the volume of production has increased from an index figure of 200 in 1921 to 285 in 1923, the number of wage earners has only increased from an index figure of 150 in 1921 to 190 in 1923. These figures show clearly the increased output per head, and the improved utilisation of power resources, and are a striking tribute to the efficiency of American production. In the last 10 years the volume of railway freight has increased by 25 per cent., while the number of employés has remained stationary. The reasons generally given for this increased efficiency are (1) the spread of education, both general and technical; and (2) the labour situation, the salient points of which are restriction of immigration, high wages, unrestricted output and the utilisation of labour-saving devices, and the satisfactory relations between employers and employed. The American employer believes in high wages and he pays them. But he also believes in high output, and he sees that he gets it.

Industrial organisation has attained a pitch in the United States which has never been equalled in any other country with the possible exception of Germany. In individual business the tendency is towards the large unit. This tendency is likely to become more and more marked. Apart from the movement towards amalgamation, there is far more readiness in America than in Great Britain for the different firms in one industry to co-operate for their mutual good, and even to go so far as to pool a great deal of their technical experience. The capacity and efficiency of American production are so great that sooner or later the country must domestically reach the saturation point, and there is no doubt that as time goes on the United States will become increasingly a factor in world trade, and we shall meet with increasingly severe competition from it. There can be no doubt that as soon as the moment comes that foreign trade development on a large scale is necessity, a nation of such initiative, energy and organising power, will build up a foreign trade system which will rival our own. Whereas Great Britain is the greatest user of American goods, she is only fourth in the list of supplying countries, in which the first place is taken by Canada, the second by Cuba, the third by Japan, and the fifth by Brazil. A regrettable tendency during recent years has been the falling off in the re-export trade from Great Britain to America, which is now buying direct from foreign countries to a much greater extent. The future trend of the American tariff has of course an important bearing upon our trade with the United States. On the whole it may be said that there would be strong opposition to any further increase in the tariff, but it is unlikely that there will be a revision downwards.

There is unfortunately a general impression in the United States that England is definitely "down and out." All our difficulties are exaggerated, and the progress that we have made towards re-construction is ignored. Not only is this doing the prestige of Great Britain infinite harm, but it is also losing us business. The report earnestly urges that some concerted steps should be taken to bring the real facts before the American public. It is thought desirable that one or more Englishmen of high standing should take an early opportunity of visiting the United States, and in a series of speeches in different parts of the country should correct the harm which has been done to British industries. It is suggested that the F.B.I. should take the initiative in this matter.

The Electrically-driven U.S.S. "Lexington."—The second of the United States Navy's new airplane carriers, the U.S.S. *Lexington*, was launched on October 3rd, at the Fore River plant of the Bethlehem Shipbuilding Corporation in Quincy, Mass. As in the case of the U.S.S. *Saratoga*, of which this boat is a duplicate, the *Lexington* is one of the largest ships ever launched in the western hemisphere, and will excel the first line battleships of this country in propulsion power. This will be the third United States airplane carrier; the only one now in service is the *Langley*, which ship was rebuilt from the old collier, *Jupiter*, the first vessel of the navy to be equipped with the turbo-electric drive. The *Saratoga*, launched this spring at Camden, N.J., is not yet in service; originally, both the *Saratoga* and *Lexington* were to have been battle cruisers, but the modification of the American naval programme, due to the decisions reached at the conference on the limitation of armaments, led to the conversion of these battle cruisers into airplane carriers. As a naval vessel, the *Lexington* (with the exception of her twin, the *Saratoga*) is the longest in the world; her length is 874 ft. and beam 105 ft. The output of the electric generating equipment is 180,000 h.p.—greater than the combined rated output of the six electrically-driven capital ships now in commission, *viz.*, the *New Mexico*, *California*, *Tennessee*, *Maryland*, *Colorado*, and *West Virginia*.

The complete electrical equipment for the *Lexington*, as in the case of the *Saratoga*, was furnished by the General Electric Co., of America. The propulsion apparatus consists of four 35,200-kW turbo-generators, supplying current to eight 22,500-h.p. motors. The turbines are operated with steam supplied by 16 oil-fired boilers. The motors are connected in pairs to each of the four propeller shafts, the total energy thus delivered to each shaft being 45,000 h.p.—sufficient to turn the propeller blades at a rate of 317 r.p.m., and to propel the ship at the rate of 33 knots, or approximately 39 miles an hour. In addition to the propulsion machinery, there are six 750-kW, direct-current, auxiliary turbo-generators which furnish current for all electrical purposes, except main propulsion. Among other uses to which electricity is put is the operation of the steering gear, anchor windlass, ventilation fans, and lighting systems. As in the case of the *Langley* and *Saratoga*, the *Lexington* is completely and specially equipped for radio work. The antenna runs to the deck from a single topmast, which has to be lowered when the boat passes under the Brooklyn Bridge.

A Remarkable High-Frequency Cable.

Inductance Coils made with Multi-Wire Cable.

Among the features of the Government's great radio station at Rugby is a cable of novel construction which forms part of a variable inductance in the high-power radio-frequency communication circuits. Generally speaking, the cable may be

Fig. 1.—The 6,561-wire High-frequency Cable.

compared with the single wire which is wound into a coil for tuning and is familiar even to the wireless tyro.

The cable in these giant inductance coils contains 6,561 wires, each separately insulated with enamel, and connected together at each end to form what is, to all intents and purposes, one conductor, *i.e.*, all the wires are in parallel. The reason for the separate insulation of each fine wire in the con-

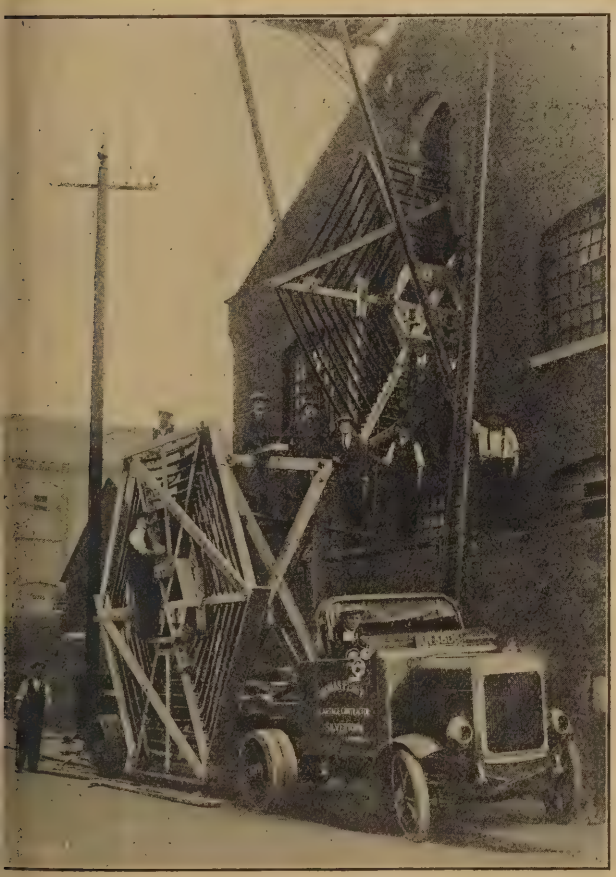

Fig. 2.—Cable and "Spiders" being removed from Works.

uctor is the alternating-current "skin" effect, as it was alled, which becomes of importance when the frequency eaches many thousands of cycles per second, as it does in vireless transmission.

The cable has two characteristics: The first is that, considered as a conductor, it is divided into a number of separate lements or wires, and the second is that the wires are plaited ogether in such a way that every wire over a given length passes through the same phases as every other wire with regard to the neutral axis, so that there is no tendency for a greater retardation, or impedance due to the high frequency, on any one wire more than another. The wires in an ordinary electric cable, although rotating around the axis, always remain at the same radial distance from the axis. In this unique inductance cable, owing to the different distances from the axis of the various wires from point to point, slight differences of potential are generated. If all the wires were bare, there would be short circuiting and the desired result would not be fully attained. To avoid this, the wires have been lightly insulated with enamel.

In the construction of this cable, the insulated wire was first covered with a layer of cotton to protect the enamel; three wires were then twisted together to form a unit, three of which units were next twisted again, and the operation was repeated until 81 wires had been assembled, when they were covered with a coat of silk to give further protection. Three such bunches were twisted again, and the operation repeated until the cable contained 6,561 wires.

The accompanying illustration (fig. 1) of the cable, showing the wires spread out fan wise, gives a clear idea of the construction of the cable, which was constructed in accordance

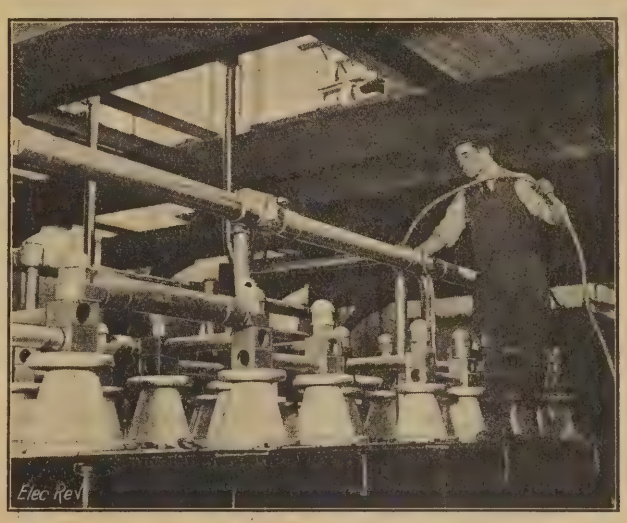

Fig. 3.—Condensers being filled with "Shell" Oil.

with the design and specifications of the British Post Office Engineering Department by W. T. Henley's Telegraph Works Co., Ltd. Its manufacture presented several unique features, which involved the design and construction of special plant and machinery.

The "spiders" shown in fig. 2 are really the complete inductance coils, the wooden framework being the former for the conductor. As they are 17 ft. in diameter, transport by rail was out of the question, and they were transported on special lorries from the manufacturers' works at North Woolwich to Rugby. The route had to be specially selected and surveyed to avoid the possibility of trouble with bridges, &c. In the second view it will be observed that the wall of the workshop had to be partly broken away to get them out. In all, nine of these huge tuning coils are to be used at Rugby.

After many years the theories of Lord Kelvin and Oliver Heaviside have thus found application in a branch of electrical development of which they were not cognisant at the time. Further, the theory and formula evolved by Lord Kelvin mathematically for frequencies of about 100 per second were experimentally proved to be correct 25 years later up to frequencies as high as 5,000 per second, and the frequencies used in wireless transmission are very much higher than this.

It has already been announced that some of the largest Dubilier condensers in the world have been installed at the Rugby radio station, and the third of the accompanying illustrations shows the condensers being filled with "K1" transformer oil supplied by Messrs. Shell-Mex, Ltd.

Lloyd's Register of Shipping.—The report of Lloyd's Register for the past year has been received. It states that the total tonnage of merchant vessels afloat holding the Society's classification is 28,436,965 tons—the highest figure recorded. Motor ships over 100 tons classified number 2,145, representing 2¾ million gross tons, and of these 19 exceed 8,000 tons; two are over 15,000 tons. The demand for double-acting Diesel engines is increasing, there being 25 sets of this type under construction; four sets of six-cylinder, two-stroke cycle, double-acting Diesel engines of 31,000 i.h.p. are being built for the quadruple-screw motor ship *Augustus* of 33,000 gross tons.

A New Design of Water Wheel.

New Jet Arrangement for Medium-Capacity Machine.

In order to meet a need which has been felt in water power work for a turbine having a capacity intermediate between the Pelton wheel and the low capacity reaction turbine, situations having been found where the Pelton wheel ran too slowly, but where the reaction turbine, with its less perfect speed regulation, and rather delicate wearing parts, was unsuitable, Messrs. Gilbert Gilkes & Co., Ltd., have designed a new impulse wheel, the "Turgo," which is claimed to maintain the simplicity of the "Pelton" type. The main difference between the two machines is that in the "Turgo" the jet makes an angle with the plane of the wheel, whereas in the "Pelton" it is directed straight on to the wheel tangentially to its circumference. This difference in the principle of the two methods is shown diagrammatically in fig. 1. The vanes or buckets can be completely enclosed at their outer periphery, allowing the water in passing over the vanes' surfaces to be completely controlled. Higher speeds can be obtained on this wheel, it is claimed, because a much larger jet can be efficiently used with a runner of given diameter. The speed regulation is accomplished by the firm's patent shaft governor.

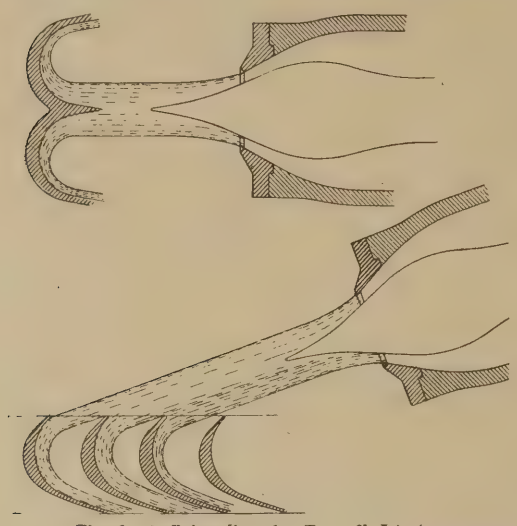

Fig. 1.—"Pelton" and "Turgo" Jet Arrangements.

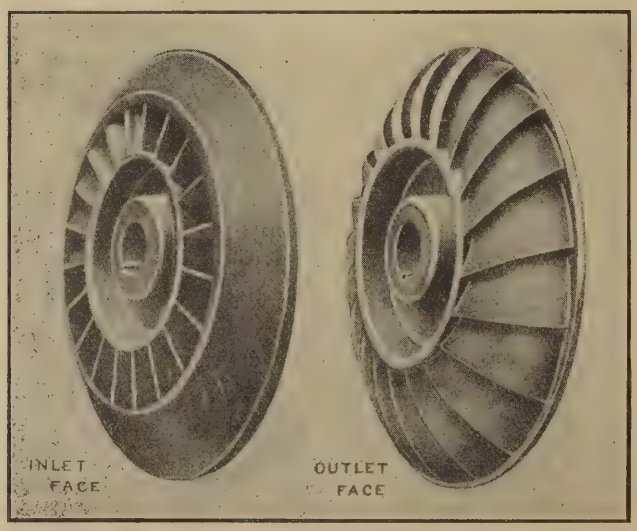

Fig. 2.—Turbine Wheel Faces.

Fig. 2 shows the inlet and outlet sides of a Turgo impulse wheel. The runner is made in one casting, and the water is directed on to the wheel in a jet of circular section through a nozzle exactly similar to that of the Pelton wheel. The plane of the jet makes a slight angle with that of the wheel, and the water enters at one side and passes out at the other. For heads up to 300 ft. the Turgo impulse wheel is standardised. The shaft is carried in ball and roller journal bearings and is located endways by means of a thrust ball bearing. The cast-iron casing is split on the horizontal centre line. Centrifugal throwers of the usual type prevent the escape of water along the shaft. In cases where no economiser is used, a hand adjustable spear rod is used to vary the size of the jet. Fig. 4 shows a complete unit fitted with a shaft governor, designed for direct coupling to an electric generator. The machine can be arranged on a vertical shaft where necessary. Fig. 3 shows a unit with the wheel exposed.

An efficiency curve prepared by Prof. A. H. Gibson, of Manchester University, from the results of tests made by him, on a 125-h.p. 18-in. wheel, shows a maximum efficiency of 83.5 per cent. at about 110 b.h.p.; the efficiency between 60 and 125 h.p. exceeds 80 per cent. and at 25 h.p. a 70 per cent. efficiency is recorded. The output of course varies with the fall of water and the size of the wheel. For an 18-in. wheel working on a 100-ft. fall the output is scheduled at 38.4 h.p., the water capacity being 260 cu. ft. per min., running at 451 r.p.m.

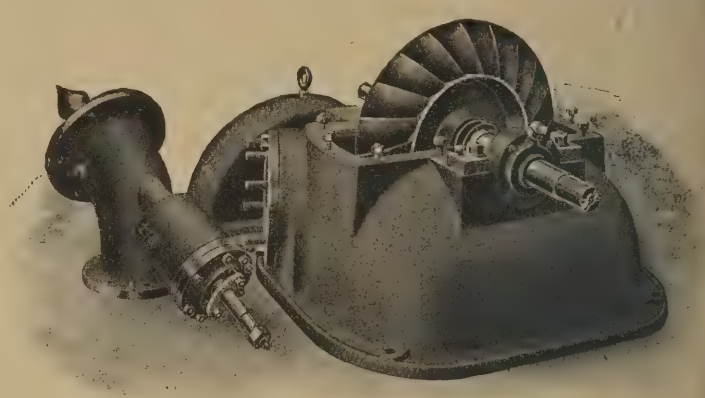

Fig. 3.—Machine with Wheel Exposed.

The Severn Barrage Scheme.—For some time little has been heard of the Severn barrage scheme, but it is gathered that, as the question of electricity supply in Great Britain is now under consideration, the Cabinet has decided that further investigations are desirable. A sub-committee of the Committee of Civil Research has accordingly, says the *Daily Telegraph*, been appointed, under the chairmanship of Lieut.-Col. Moore-Brabazon, Parliamentary Secretary to the Ministry of Transport, and the project will receive examination. It was stated in the House of Commons last May that a preliminary investigation of a very minor kind had taken place, and it confirmed the opinion of Sir John Snell that the scheme ought to be proceeded with. Lieut.-Col. Moore-Brabazon, who was speaking for the Government, said on that occasion that it was hoped "one of these days" to get a 200,000-kilowatt continuous supply out of the scheme. As regards the national electrification scheme, which is before a Cabinet Committee presided over by Sir Douglas Hogg, it is gathered that both financial details and questions of policy, such, for example, as the ownership of the proposed super-power stations, will have to be settled before a public announcement of the Government's proposals can be made.

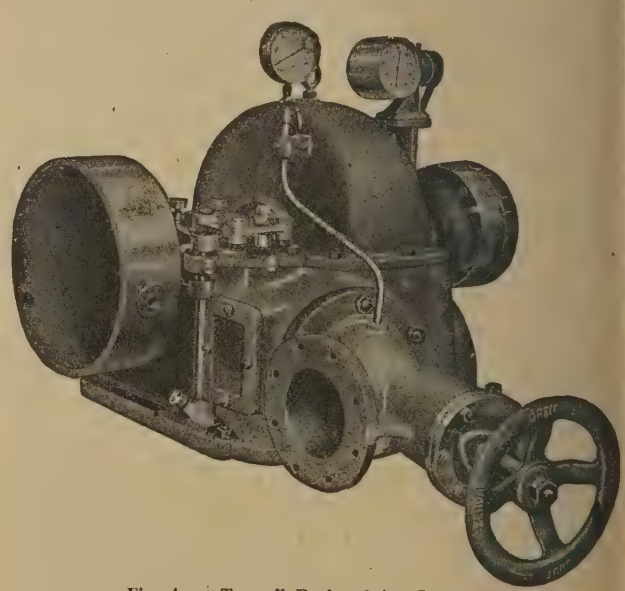

Fig. 4.—"Turgo" Designed for Generator.

Dielectric Problems in High-Voltage Cables.

By P. DUNSHEATH, O.B.E., M.A., B.Sc., M.I.E.E.

(*Abstract of paper read before the* INSTITUTION OF ELECTRICAL ENGINEERS.)

(*Concluded from page 775.*)

HAVING examined the flow of current into an absorptive condenser under a steady unidirectional e.m.f., we will now consider what happens when such a condenser is connected to an a.c. supply.

Fundamentals of a.c. Losses.—The magnitude of the a.c. flowing (see fig. 3, last week) will depend on the current: a charging and geometric capacity; this will be a pure wattless current and comparable with that component of the d.c. ballistic capacity current associated with the charge C E (fig. 7); β flowing through the dielectric entirely by conduction or leakage, and γ into the capacity associated with absorption or the slow charging of component condensers through resistances. Only β and γ give rise to loss, the first to conduction loss and the second to what is usually styled hysteresis loss. This idea of hysteresis, based on a viscous molecular movement, seems to the author to be quite unnecessary, and by the following alternative conception, dielectric losses are considered to be due to currents flowing through circuits having definite resistances, composed in turn of an infinite number of component currents varying in phase relationship with the e.m.f. from zero to quadrature, see fig. 2. Thus a.c. dielectric losses can be considered to be I^2R losses and can be divided into non-cyclical losses, losses due to leakage, and cyclical losses due to absorption. Both presumably have the same origin, but the latter, being due to a current which flows through a condenser in series with the resistance, is thus dependent on the frequency. The value of the resistance in the second case is, of course, experimentally indeterminate.

Interpretation of a.c. dielectric losses in terms of the absorption equation $I_t = I + At^{-n}$ leads us to a definite expression for the a.c. power factor in terms of the d.c. absorption index n, from which values of $\cos\theta$ have been calculated, and the results are plotted in fig. 10 to cover a usual range of power factors obtained on impregnated-paper cables. It follows from the relationship brought to light in this diagram that, *so far as the losses due to absorption* are concerned, the perfect cable dielectric is that in which the index n in the absorption equation equals unity, giving zero power factor, and the nearer this index approaches its maximum value of unity the lower will be the a.c. power factor. The conclusion receives considerable support too from the experimental results which show that the drier and cooler a dielectric the nearer n approaches unity. This is an important conclusion and illustrates the very close connection that does exist between the a.c. and d.c. characteristics of a dielectric. It suggests also a method for the determination of a.c. power factor in which only d.c. tests are applied. The total losses in a given dielectric, however, comprise not only these due to absorption, but a further source of loss due to ionisation of enclosed air. The actual power factor determined experimentally will therefore be some value in excess of that given by fig. 10 by a quantity due to this other cause.

"V" Curve for Losses and Power Factor.—A very important and interesting relationship in the study of cable dielectrics is the variation of dielectric loss with temperature. Over

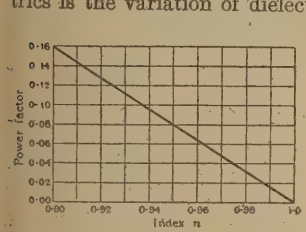

Fig. 10.—Relation between P.F. and Absorption Index.

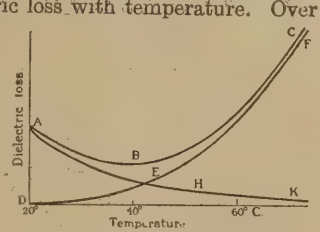

Fig. 11.—The "V" Curve Resolved into Two Components.

a working temperature-range the dielectric loss in most cables falls to a minimum at about 40 deg. C., and then rises again. The variation when plotted is the "V" curve of dielectric loss. The power factor curve is of the same shape owing to the charging currents being practically unaffected by temperature. So far no satisfactory explanation of the shape of this curve has been given.

The I^2R theory of dielectric losses formulated to replace the hysteresis conception seems to offer a better explanation of the "V" curve. Reverting to fig. 2, we recall that the elementary power factors were in each case proportional to the assumed series resistance. Now this conducting path in a dielectric is of an electrolytic nature with a negative temperature coefficient of resistance. If the temperature be raised, the resistance falls and with it the power factor $\cos\theta = \omega CR$. Both falling and rising portions are due to change of resistance with temperature. In the former case the resistance is in series with capacity, in the latter it is in parallel. The point is illustrated by fig. 11, where A B C is the curve obtained experimentally. Curve A H K is the component falling due to the decreasing resistance in series with capacities, and D E F the component attributed to direct leakage.

The author's tests embody one or two unique features illustrating the "V" curve, which may be described with advantage. In most tests high voltages are employed and, in order to explore a new field, it was decided to carry out a voltage/temperature range of loss tests at quite low voltages. The limits adopted were 50 to 110 volts, and the temperatures varied from 17 deg. C. to 85 deg. C. The dielectric losses were plotted against temperature for the different voltages, and the outstanding feature is the existence of the "V" curve. It is of considerable importance to note that it exists at such low voltages.

The shape of the "V" curve obtained from power-factor tests on a high-voltage cable may be deliberately changed by the use of different papers, impregnating compounds, and methods of manufacture. In all cases of impregnated-paper cables, where there is a minimum point in the "V" curve it seems to occur at a temperature about 30 deg. C. to 40 deg. C., but the minimum point can be eliminated entirely by certain treatment. For instance, in fig. 12 cable E was known to be imperfectly dried and the power factor, starting at an abnormally high value at normal temperature, continues to rise with temperature with no attempt at a minimum point. Cable F was impregnated under special conditions and with a special compound, both of which are known to produce a low power factor. In this case the power factor remains independent of temperature from 20 deg. C. up to 40 deg. C. and then only rises very slowly. Our present knowledge is insufficient to explain these curious variations in the "V" curve, but they may possibly be based on some peculiarity in the distribution of the elementary currents assumed in our treatment of absorption. If, for instance, the presence of moisture without actually adding direct conduction loads the system of condensers and resistances towards the conductance end of the series, the effect might be to produce a curve like E in fig. 12, or a curve like F could be produced by a "spreading" of the characteristics over the whole of the series.

Considerable light is thrown on the nature of the "V" curve by plotting the results of dielectric-loss tests taken on a length of cable at two different frequencies. While the 50-cycle loss is approximately double that at 25 cycles, at the low temperature the values run together as the temperature rises and at 150 deg. F. the loss is the same for both frequencies. As the charging current is proportional to the frequency, the power-factor curves have the opposite characteristic—they run together at the lower temperature and separate at the higher; at 50 deg. F. the leakage is negligible and at 150 deg. F. it predominates, but it will be shown in the next section that this assumption is incorrect. Notwithstanding the fact that the 25- and 50-cycle loss curves run together at the higher temperatures, it does not follow that at this temperature the loss is all direct conductance. The evidence is fairly clear that if tests were taken at much lower frequencies than 25, the two curves would separate at 150 deg. F. and for frequencies of the order of a fraction of 1 per second would separate very widely.

Connection between a.c. and d.c. Losses.—Very little information has been published on the connection between a.c. and d.c. losses in a cable dielectric; steady-current tests have been carried out on the cable referred to in the previous section and the connection between the a.c. and d.c. results have been calculated. The results obtained by comparing the d.c. tests just mentioned and the a.c. tests of the previous section taken on the same piece of cable establish several important points: First, the ratio of a.c. to d.c. losses in a paper cable at low voltages varies between wide limits (in this case from 4.350 to 12.3) depending on the temperature and the time of charging under d.c. conditions. Also the duration of the d.c. charge has a more marked effect on the ratio at low temperatures than at the high ones.

The most important result of all is in connection with the "V" curve explanation advanced in a previous section. The view sometimes expressed that at the higher working temperatures of paper cables the greater part of the dielectric loss can be attributed to conduction based on d.c. values seems to be wrong. The results obtained in these tests indicate that at 85 deg. C., which is in excess of normal maximum cable temperatures, the a.c. loss is more than 13 times the value calculated on the d.c. conductance, even on 120-minute d.c. results. As the conductance was still falling at the end of this time the ratio of a.c. to d.c. loss at 85 deg. C., based on final conductance, must have considerably exceeded the value of 13. The results show that around 80 deg. C. by far the greater part of the 50-cycle losses are cyclical. Following up the argument of Section IV, the difference between the ordinates of the upper and lower curves represents the I^2R losses due to the absorption currents flowing through component resistances, and it seems to follow that the absorption losses have definitely in themselves the two components to produce the dipping curve.

Attempts have been made by some investigators to throw light on the relationship between a.c. and d.c. losses by determining the effect of frequency under the a.c. conditions. Addenbrooke showed that, except for frequencies of the order

of 1 or 2 cycles per second, the loss in a large number of different dielectrics was a linear function of the frequency n and that if expressed as watts $= A + Bn$ the higher class of dielectrics gave the lower values of A. The author has examined this characteristic for impregnated-paper cables at different temperatures and at two frequencies. A typical set of results is plotted in fig. 13 for a length of 3-core super-pressure cable subjected to 25- and 50-cycle loss tests while immersed in water at various temperatures from 52 deg. F. to 150 deg. F. The curves show that the characteristic noted by Addenbrooke for different dielectrics is also brought to light by temperature variation in one and the same dielectric.

Rise of Power Factor with Voltage.—"Ionisation" is believed to be due to the presence of air entrapped within the cable dielectric. The results of the low-voltage tests given in Section V show no ionisation on this cable at 110 volts. The losses for these tests plotted logarithmically against voltage justify very exactly an expression $W = PE^m$ where W = loss in watts, E = applied voltage, and P and m are constants (m is found to be equal to 2 very exactly.)

An important factor in any study of the connection between power factor and voltage is the effect of overloading a cable. The tests taken immediately after manufacture may give only a very slight rise of power factor with voltage, but if a heavy current be passed through the cable so as to cause undue heating of the dielectric and expansion of the lead, then the repeat tests carried out on the length after cooling down will give a much sharper rise.

In view of the dependence of power factor on the two variables, temperature and voltage, and the need for a quick method of comparing the results on a number of cables, the author has found it convenient to employ solid diagrams for plotting the results. Four such models are shown in fig. 14. The values of power factor at any one voltage are plotted against temperature and the curve so formed is cut out of 5-ply wood ¼ in. thick. Similar curves are produced for each of the other voltages employed in the series of tests, and when they are assembled the resulting block gives a very useful bird's-eye view of the properties of the cable. In the determinaiton of the effect of some modification in materials, or manufacture,

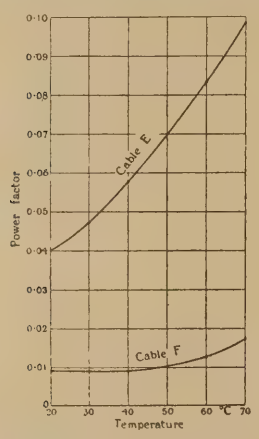

Fig. 12.—Effect of Imperfect Drying on Shapes of "V" Curve.

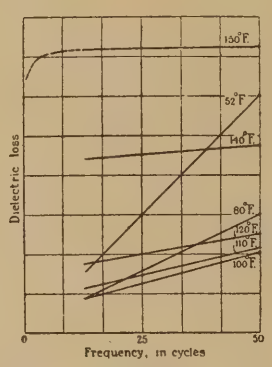

Fig. 13.—Impregnated-paper Cable; variation of Dielectric Loss with Frequency and Temperature.

when carrying out research work on cables, the comparison of two or more such blocks is much easier than the comparison of masses of figures.

Breakdown; Time-Voltage Relationship.—Quite recently the exact relationship between breakdown voltage and the time of application to the cable has called for detailed study. This time effect is quite a new phenomenon and F. M. Clark has shown that if a fibrous insulating material, such as impregnated paper, be subjected to a succession of voltage applications below the value necessary to cause failure, the dielectric being allowed considerable time for recovery between the applications, its power of resisting a straight breakdown test may be very much impaired. This means that indiscriminate high-pressure tests may seriously affect the life of the cable under working voltage, and that a succession of pressure-rises due to surges or lightning on connected open lines, although individually resulting in no failure, may make the cable progressively less able to withstand such voltages.

The author produces time/voltage curves for all cables made under research conditions by cutting a uniform length of cable into six or eight pieces, each 5 yards long, applying a quick breakdown voltage at a definite rate of increase and then applying 90, 85, 80 per cent., &c., of the value so obtained to the remaining pieces in turn. Plotting the results gives a curve that is very steep for short times and gradually flattens out until quite a small reduction in the voltage adds enormously to the time that the cable will stand up under it. As an indication of the order of the figures obtained, a good modern 33,000-volt cable will hold 75,000 volts three-phase at normal temperatures for 50 or 60 hours before failure. Instead of plotting the breakdown voltages against time the values may, as described by Owen, be plotted against the inverse fourth root of time when the points lie reasonably on straight lines. The greatest merit of this method of plotting seems to be that with it one can deduce with reasonable accuracy the probable voltage that a cable will hold indefinitely. It is evident that any precautions that can be taken to control the extent of pressure-rises on a cable system are well worth consideration.

Nature of Cable Breakdown.—Study of the conditions of individual papers taken from different parts of cables both broken down on test and subjected to prolonged pressure test, has led the author to formulate a theory of cable failure differing somewhat from those already advanced. The true explanation seems to lie somewhere between the tangential-stress theory of Höchstädter and the pyro-electric theory of Wagner.

Cables caught before actual failure in a pressure test reveal the following facts:—

(i) In a single-core cable at any point throughout the dielectric between the conductor and the lead sheath there may be a few consecutive papers showing signs of charring.

(ii) The papers above and below those damaged may be in perfect condition.

(iii) The charred condition is restricted neither to the proximity of the conductor nor to that of the lead; it may occur anywhere in the dielectric.

(iv) In a 3-core cable the same conditions hold, but, generally speaking, the charring occurs mostly on the outer core papers and either along the line of contact between cores or towards the centre of the cable.

(v) In a 3-core cable the belt papers rarely (one hestitates to say never, though this would probably be a correct word) show signs of charring.

In the earlier part of this paper it was contended that all a.c. dielectric losses are I^2R losses, the cyclical ones being due to the dissipation of energy when a current charging a condenser flows through a resistance. Now no cable dielectric is perfectly homogeneous; in a single-core cable, if the dielectric were perfect and uniform, the lines of current-flow would be

Fig. 14.—Models Recording Variation of Power Factor.

radial throughout and the current would be a pure displacement current. In a practical cable, however, we have (*a*) a layered dielectric where each layer contains paper fibres which have tiny quantities of moisture and so form electrolytic conducting paths perpendicular to the theoretical direction of the electric field; (*b*) inequalities in the contact between layers which result in a difference of impedance between one radial path and another.

Fig. 15 shows the result that may be expected from such considerations. Suppose that at point P there is a small patch where the two layers of paper are not making as efficient contact with one another as they do elsewhere. This weakness may be due to slackness of the papers, to an impervious spot in the paper preventing passage of the impregnating compound, or to imperfect drying. Whatever the cause, the result is to deflect the lines of flow of the displacement current and in so doing to turn them out of the radial direction. Immediately, the power factor of this part of the dielectric rises as the current flows along the paper fibres, energy is dissipated, and the resulting heat chars the papers and compound.

Further supporting evidence for this theory is given by the shapes of charred holes in single-core cable breakdowns. They frequently emerge on the outer surface in a direction oblique to the radius, as at Q.

A metal inter-sheath just on the inside or on the outside of the weak spot P would reduce the tendency of the weakness to spread, would reduce the I^2R loss and, without any question of the sheath being held at a definite potential for grading purposes, would strengthen the dielectric simply by its presence.

Assessment of Cable Quality.—Attention is being given by cable purchasers to (i) the drafting of specifications and (ii) tests in order to ensure that the cable shall meet all the condi-

tions of service satisfactorily. Apart from fixing the design, or approving a design submitted by the cable maker, there is a good deal to be said for matters under (i) being left to the manufacturer. In considering (ii) it will be appreciated that the tests which are suitable for cables to work on lower voltage are not suitable at 33,000 volts and upwards. The two

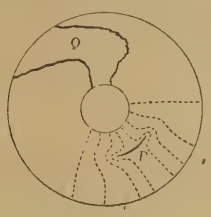

Fig. 15.—Effect of Irregularity on Dielectric Current.

guiding principles which might receive more attention by purchasers in selecting tests for use in accepting high-voltage cables are:—

(*a*) The tests which may shorten the subsequent life of the cable in service should as far as possible be restricted to special test-pieces not to be used afterwards.

(*b*) The object of using high-voltage cables is to lower transmission costs, and this object is partially defeated when the tests are made unnecessarily complicated and expensive, as the cost of the tests must be added to that of the cable. Tests on the thermal properties of a drum length, for instance, are very interesting, but, in view of all the other factors, are of minor importance to-day for acceptance purposes.

Discussion in London.

Mr. S. W. Melsom congratulated the author on having avoided the error of being too assertive, which had been noticeable in several recent papers. Whilst inclined to agree with the author's theoretical treatment of the subject, a good deal more experimental work would have to be carried out before his theory could be finally accepted. The assessment of cable quality needed a good deal of elucidation; it could have been made the subject of a paper to itself, and if the author had confined himself to that alone he would have earned the thanks of both makers and users of cables.

Mr. L. Emanueli, who was visiting this country from Italy, was specially welcomed by the President. While he agreed with several of the author's ideas, unfortunately the physical conception of what happened in a dielectric and upon which a mathematical theory could be built, was incomplete. However, the author's theory was the most probable one. The experimental part of the paper was incomplete, and a very important point in h.p. cable manufacture was the change in power factor caused by lowered insulation. The power factor diminished as the temperature increased, because the compound expanded and filled empty spaces. That part of the paper which dealt with cable breakdown was the most important. He referred to a paper he recently read before the International E.H.P. Conference, in which he described experimnts which showed that ionised air-pockets tended to displace the compound, which was sometimes accompanied by frothing, and in some cases it actually changed chemically. This was the probable reason of breakdown. A cable had been in successful operation in Italy at 130,000 volts for 18 months and it only differed from lower-voltage cables in that air and gas bubbles had been entirely eliminated from the insulation. Concerning inspection tests, he thought the ionisation test was better than the d.c. low-pressure test. To measure the power factor by passing current through the cable was apt to damage the dielectric, and he recommended the use of a constant-temperature bath. He hoped it would not be long before all cable makers would be able to come to some sort of agreement.

Mr. H. A. Ratcliffe explained that his undertaking had some 60 miles of 33,000-volt cable "more or less" in commission; that was to say, he had had his share of the troubles inseparable from a new technical development, but some of that cable had been in uninterrupted operation for six years. The author's explanation of dielectric charging phenomena threw valuable light on what happened inside a cable, and his views on that subject merited serious consideration. Dielectric stress tests should be made on experimental lengths, and not on the cable itself. What the cable user wanted to know was whether a cable could be expected to last for, say, 25 years under ordinary working conditions. He felt that transient phenomena were very much over-rated, and that when they did occur there was generally some definite explanation for them. He had abolished the use of spark gaps and surge arresters on 6,600-volt cables, whilst those installed on 33,000-volt cables had functioned rarely, if ever; the cables themselves provided the best sort of arrester for that sort of thing. The maximum stress theory had little bearing on a cable's actual behaviour; cable makers had rushed to the other extreme, but it was significant that they were now increasing the thickness of core walls again; 3-core cable breakdowns were as often as not due to mechanical rather than electrical causes.

Mr. H. A. Allen inquired whether the author had attacked charging currents from the point of view of the late Dr. Steinmetz, as expressed in his paper on "Cable Charge and Discharge." It provided an accurate method of comparing the qualities of different cables. In connection with fig. 12 it had not been stated which curve was due to the heavier oil. The explanation might be that infinitesimally small air bubbles were occluded in the insulation; the bubbles might exist among, and even inside, the fibres of the paper, but it was uncertain whether they were necessarily deleterious. Supposing that such finely divided air existed, as the temperature increased the oil expanded and compressed the air, so improving its dielectric properties and reducing the loss to a minimum.

Mr. C. J. Beaver, having "taken off his hat" to the first part of the paper, said he must "take off his coat" to the latter half. The I^2R theory had nothing to do with what occurred inside a cable and it did not explain the deterioration of papers during h.p. tests. He had not known that to happen except in the case of material that had been exposed to the air. It was neither electrostatic dispersion nor ionic flow (as had been suggested by Mr. L. Emanueli), but hydrostatic dispersion. The author had initiated another school of thought in this matter; 90 per cent. held the ionisation theory and the remaining 10 per cent. the moisture theory, but the factor that ultimately determined the breakdown of a cable was the amount of energy dissipated into heat per unit volume of dielectric. The statement at the end of the paper attributed to him by the author was incorrect.

Major A. M. Taylor was pleased the author considered that intersheaths improved the dielectric strength of cables. Intersheaths enabled the puckering of the paper to be checked and even eliminated, and their use also made it possible to control more effectively the temperature of the different sections of the cable.

Mr. H. C. Silver suggested that more attention might be devoted to the measurement of resistance and less to the electric strength. Was it possible that the passage of an electric current through the dielectric converted it into a partial conductor by chemical action, which could only take place in the presence of moisture?

Mr. G. W. Addenbrooke pointed out that dielectrics in an even field behaved differently to dielectrics in a cable. Mixing two substances together gave different results and that was the explanation of the dip in the curve of which the author made so much. Much of the moisture in the oil when the cable was tested went into the paper under the influence of heat, and it later returned; that was a part explanation, but an increase of pressure would reduce losses. Pressure had a great influence on resistance, but not on capacity, which was a point not mentioned in text books; it pointed to absorption losses being due to moisture and not to the material. What was needed was a pure physical explanation of what occurred inside a cable.

Mr. W. D. Owen was surprised at the author's admission that the time factor was a new phenomenon. The breakdown value fell with time and not at a constant rate; thus, the breakdown value of a dielectric could not be referred to in terms of a given time. A safety factor was a ratio, but in the case of cables of which two factors?

Mr. P. Dunsheath said he would reply to the points raised in full in the I.E.E. *Journal*.

A Fire-Extinguishing Demonstration.—We recently witnessed a demonstration given by the Total Fire Extinguisher Co., Ltd., of the "Total Fire Extinguisher," a product of the company, designed to deal with incipient fires irrespective of their origin, which is to be manufactured in this country in the immediate future. The apparatus consists primarily of a powder container and a steel cylinder containing liquid carbonic acid. The powder, a special preparation which, when heated, generates CO_2, is expelled from the container to the fire under the influence of the acid in the cylinder which is emitted in gaseous form through a suitable operating valve and nozzle to the powder container. The latter is fitted with a safety valve designed to work at 45 to 60 lb. per sq. in. pressure. The CO_2 cylinder is of seamless drawn steel tested to the standard requirements; it is, of course, suitably connected to the powder container. The apparatus is held in a bracket which protects the operating valve by a cover and also the discharge nozzle by a shoe. When suspended the "extinguisher" is held with the operating valve at the top. Should the apparatus be tampered with the cover opens, breaking the seal, and displays a red-light signal. The principle of the working of the "Total" is to cut off the supply of atmospheric oxygen to the burning object and surround the latter with a dense volume of the mixed extinguishing medium. The force with which the cloud is ejected enables the operator to fight the fire in a confined space. A question of considerable interest to the station engineer is that it is claimed that the extinguishing medium is a non-conductor of electricity, and that, therefore, the apparatus is suitable for fires of electrical origin, or where there is a danger of making contact with live conductors. At the demonstration structures of tar barrels and timber soaked in tar and petrol when burning furiously were dealt with by the "Total" with immediate effective results. The apparatus is manufactured in several sizes, from the small domestic size, which can be conveniently operated and carried by one person, to much larger ones carried in a cradle mounted on a pair of wheels. The largest type of extinguisher used at the demonstration holds 165 lb. of powder.

Notes from New Zealand.

(From Our Own Correspondent.)

Mangahao Inadequate.

The remarkably rapid growth of hydro-electricity in New Zealand may be gauged from the fact that already the Government's huge undertaking at Mangahao is threatened with a permanent overload. When this big project was first completed some eighteen months ago it was confidently expected that it would meet all the requirements of the district for some years at least, and it was even suggested that the Government would have some difficulty in disposing of available current. With the progress of reticulation, however, and the rapid growth of popularity of electricity as an illuminant and power agent, it now transpires that the various Power Boards in the district are anxious to acquire power far in excess of Mangahao's capacity.

The Government is now faced with the immediate necessity of constructing the second Mangahao dam for storage purposes, and the completion of this work will temporarily cope with the situation. The chief electrical engineer, however, has expressed the opinion that at the present rate of increase in demand, even the second dam will be inadequate and the Government will be obliged to push on with the Waikaremoana scheme, a contingency that was not expected to eventuate for some years at least.

Mangahao's present capacity is 24,000 h.p., and it is at the moment the largest scheme in operation in the Dominion. When the Lake Coleridge duplications are completed Mangahao will fall into the second place, but both Waikaremoana and Arapuni projects will cause even the revived Lake Coleridge scheme to fade into comparative insignificance.

Growth of the Electrical Demand.

During the last six years in New Zealand over 50,000 h.p. has been supplied from completed schemes at a cost of approximately £2,200,000, which works out at an average of £45 per horse power. In the case of the Lake Coleridge project the capital expenditure to date amounts to £1,008,491, and the total net profit for the past twelve months amounted to £5,434, thus reducing the total deficiency to £17,738, while works are in progress to raise the capacity of this plant to 27,000 kW. The Mangahao plant has absorbed some £1,493,456 capital expenditure to date, but as this station has not yet had a full year's run it would not be fair to compare it with others. The Horahora scheme has absorbed £522,973 in capital expenditure and the yearly working returns show a final net profit of £21,192, after all outstanding deficiencies have been wiped off. The Waikaremoana plant is only a small development at the moment, the major scheme not having been commenced, but a capital expenditure of £77,314 has already been involved, while as a final result of the year's operations the net loss is £3,295.

So far as the Department itself is concerned, the financial position is fairly sound. During the year its assets were valued at £4,753,248. The net expenditure amounted to £4,373,809, leaving a credit balance at the end of the working year of £379,439. Legislative authority exists for the raising of £4,000,000, and there are proposals to transfer £1,000,000 from the accumulated surplus and to raise another £4,000,000, so that the total available funds will reach £9,000,000.

Licensing of Wiremen.

As a result of accumulated pressure from those most intimately concerned, and partly in view of the large number of fatal and other accidents resulting from inexperienced wiring in some installations, the recent Power Conference in New Zealand has submitted draft regulations for the consideration of the Government covering the licensing and registration of all electrical wiremen. It is the desire of the Power Boards that after April, 1926, no electric wiring shall be done in any part of the Dominion except under the immediate supervision of fully-qualified and experienced men. When one considers the serious liability to fatal accidents made possible by placing electric wiring in the hands of incompetent individuals, it is in the best public interest that some such safeguarding measure should be instituted. In addition to the Wiremen's Act requiring the licensing and registration of all wiremen, it is proposed to set up a Board to administer the Act. This Board will consist of representatives of the Power Boards, insurance companies, the wiremen themselves, and the Government. The functions of the Board will include the providing of an examination for wiremen, maintenance of a register, inspections, and the examination of complaints, endorsement of licences, &c. The necessary appeal Board for the wiremen will consist of a magistrate and two qualified assessors, and provision is also made for the punishment of offences under the Act by fines up to £20. The measure is desired by all sections of the community and particularly by the wiremen themselves.

A New Railway.

An important railway undertaking is about to be launched within sight of the city of Wellington, when the largest railway tunnel in the Empire will be commenced, to link Wellington with the big settlement areas of the Manawatu. This tunnel will enter the hills between the existing railway stations of Kaiwarra and Ngarauhanga and continue in a straight line to the portal near the existing Tawa Flat railway station, a distance of eleven miles. At the present time the Wellington-Manawatu railway line is severely handicapped by the steep and winding grades between Thorndon and Tawa Flat, where the run over this 13-mile section on a 3 ft. 6 in. gauge takes almost 50 minutes, and limits the trailing loads to such a minimum as to seriously interfere with the economic operation of the whole line. The driving of the new tunnel is expected to take a minimum of five years, but it is not expected to complete the work within about eight years at the least. When this work is completed the schedule will be reduced by some 20 to 25 minutes, greater trailing loads will be possible, and it is anticipated that by that time plans will have been completed for the electrification of the whole of the suburban section as far north as Paekakariki at least—33 miles from the city. One important effect of this tunnel will be to bring a large tract of valuable settlement land within easy reach of the city and convert some thousands of acres of first-class seaside residential areas into suburban centres.

Electrical Material.

A large quantity of foreign electrical material has recently found its way into the New Zealand market, and has occasioned some little concern among dealers on account of the unsatisfactory results attendant upon its use. So far as inquiries have shown none of the poor material is of English manufacture, nor has it come through English firms, except in one instance, involving some lamps. Lamps seem to be the main supplies affected as these articles so easily advertise their inferiority, but there are several other lines, especially in radio materials, where the importations have proved unsatisfactory.

The Government is considering the question of setting up a Bureau of Electric Standards with a view to inspecting and testing all electrical apparatus and material imported into the country. At the present time a certain measure of inspection is being maintained by the fire underwriters as well as by some of the local bodies especially interested, but the rapid growth of electrical utilities is such that the matter must be handled on a large and comprehensive scale, and it would seem that the Government is the best authority to undertake the work. Government testing laboratories will be erected probably at Wellington and Auckland, and the supervising body will exert the same powers as a censor in examining all materials and refusing import entry in all cases in which goods fail to come up to the standard requirements.

Electro-Chemistry and Metallurgy.

Some Figures of Cost and Output.

(*Abstract of Chairman's Address*: Mersey and North Wales (Liverpool) Centre *of the* Institution of Electrical Engineers.)

Mr. A. E. Malpas, Wh.Sc., M.I.E.E., delivered his inaugural address as chairman of the above-named Centre of the Institution on November 2nd, choosing as his subject that of electricity as applied to the electro-chemical and electro-metallurgical industries. He briefly outlined the fundamental equations and reactions involved in the manufacture of calcium carbide and its derivatives, the oxidation of atmospheric nitrogen, the electrolytic production of gases, and the extraction of metals, relying principally on a very large number of lantern slides to illustrate the subject.

Pointing out that the largest outlet for calcium carbide was in the manufacture of cyanamide, the author remarked that the capacity of the American Cyanamid Co. at Niagara Falls was 75,000 tons per annum, and other plant in Germany and elsewhere was in operation on a more or less similar scale. The world capacity for the production of cyanamide was estimated at about 300,000 tons per annum, and, although at least 40 different compounds were produced from cyanamide as a raw material, probably the largest product was a nitrogenous fertiliser and in this field entered into competition with Chile saltpetre. One of the Norwegian water-power plants on the Hardanger Fjord, which was extended in 1914, absorbed some 50,000 h.p. for the manufacture of the carbide and some 6,000 h.p. for the conversion to cyanamide. From the Skjaldalsfos waterfall 130,000 was developed. Running at 100 per cent. load factor it was probable that the cost of generation did not exceed 0.04d. per kWh. The selling price metered as h.p. at the works transformer sub-station was 0.07d. kWh on the pre-war contract.

The home of the oxidation of atmospheric nitrogen process was also in Norway at Notodden, where over 400,000 h.p. was installed and 13,000 tons of air were blown through the furnaces every 24 hours. Some £8,000,000 had been spent on the development of the power plant and the equipment of the factories, equivalent to, say, £32 per kW installed. The heat recovered by the steam boilers per kilowatt-year expended in the furnace was equivalent to that of one ton of coal and was sufficient to supply the whole requirements for steam of the chemical processes involved.

Other solutions of the nitrogen problem had been found, more particularly that known as the Haber process and its modifications. Since this reaction was exothermic no great amount of power was required to maintain it once the reaction was started, so that the process was one that could be economically worked without the aid of cheap water power. The mechanical difficulties that had had to be got over in applying the equation in practice, had been solved in different ways by Haber, and later by Claude in France, and by Casale in Italy. The process was also being now worked on a large scale in England.

In connection with the electrolytic production of gases the Knowles cell was to-day probably the most widely used of the many variations, and it was gratifying to note that it was almost a local product in that it was manufactured on a large scale at Chester.

As a result of Sabatier's work on the hardening of oils by means of hydrogen, on which the supply of synthetic butter so much depended, the demand for hydrogen largely increased and was met partly by electrolytic methods and partly by other means, notably the Lane steam-iron process. To-day the electrolytic method appeared to be displacing the other processes. Still more recently, the demand for synthetic ammonia gas increased to such an extent as to necessitate further supplies of hydrogen and plant for producing it. Knowles cells capable of absorbing 20,000 kW and producing eight tons of hydrogen per day were at work, or shortly would be at work, not only in England, but in France, Italy, Russia, Chile, and other countries. Plant was now being erected in the French Pyrenees to absorb 11.250 kW and to produce 70,000 cu. ft. of hydrogen per hour, which would be used in the production of ammonia by the Casale process. Of minor importance, but still of interest, was the fact that there was a small Knowles installation at Bodio, in Switzerland, for the production of synthetic rubies. Oxy-hydrogen muffle furnaces were used, the supply of gases being produced electrolytically. Taking the cost of energy as 1/10th penny per kWh, the cost of hydrogen worked out at one halfpenny per metre cube for the power used.

Other gases than hydrogen were produced electrolytically by using an appropriate solution. The most commonly used was sodium chloride, giving chlorine at the anode and caustic soda and hydrogen at the cathode. The largest installation in the world was said to be the plant put down by the U.S. Government at Edgeware Arsenal, where 3,500 Nelson cells were installed for war purposes to give 100 tons of chlorine per day and the equivalent of caustic soda.

It was said that cells for the production of magnesium had been operated by the Magnesium Co. at Wolverhampton at 5,000 amperes, each taking 5 volts and giving an output of 100 lb. of metal per 24 hours, or 6 kWh per lb. of metal. It was thought that magnesium had a future before it for the production of light alloys and that it might some day compete with aluminium.

The output of aluminium had grown to very large dimensions, the raw materials used being bauxite and carbon. The crude material contained about 60 per cent. alumina and to refine it sufficiently for use required the expenditure of 8 tons of coal per ton of finished metal, which no doubt explained why the manufacture of aluminium had developed to the extent that it had done in England, the ore being first brought to the coalfields for refinement and afterwards treated in electric furnaces at one of the hydro-electric power plants. At the furnace each ton of metal required 25,000 kWh, so that at 1/10th penny per kWh the cost for electricity was £10 per ton.

The two hydro-electric installations in this country producing aluminium were those of the British Aluminium Co. at Kinlochleven, Scotland, and of the Aluminium Corporation at Dolgarrog, North Wales. At the Kinlochleven power house 35,000 b.h.p. was installed. The new installation at Lochaber would bring the total capacity up to 107,000 b.h.p. in a year of average rainfall. The Dolgarrog installation was capable of extension up to approximately 33,000 e.h.p. Both plants together should, when fully loaded, be able to turn out some 36,000 tons of metal per year and thus supply a large part of the world's consumption, which was said to amount to 45,000 tons in the year 1911. From figures published in 1910 it was estimated that the cost of power delivered to the Kinlochleven factories was 1/10th penny per kWh, including all charges from dam to switchboard, and that the cost would fall as the load increased. The cost of the power plant was given as £600,000 at that date and of the chemical plant £650,000, the equivalent of £17 and £18.5 per kWh installed respectively.

It was of interest to record that an installation built during the war at one of the hydro-electric plants in Italy for the production of aluminium had since been shut down and was turning over to the manufacture of synthetic ammonia. It would seem, therefore, that so far as aluminium was concerned, Britain should be able to hold her own, but that in order to foster other electro-chemical industries, everything possible should be done to reduce the cost of power production in this country.

Transmission Line Power Limits.

Mercury Rectifiers as Excitation Adjuncts.

The power limit of transmission lines is a live subject. In the October issue of the A.I.E.E. *Journal*, Messrs. R. E. Doherty and H. H. Dewey point out the essential features to be considered in a study of the problem and call attention to an experimental investigation of the subject. The latter part of their paper discusses the possibility of increasing the limit of power transmission by improving the apparatus and the characteristics of the transmission circuits, and it is pointed out that no great development may be expected from any scheme yet proposed regarding a modification in line characteristics. With reference to the apparatus, it is possible to make some changes in the design of synchronous machines tending to "stiffen" them, such as higher saturation, larger air-gap, &c., but in general no radical improvement of this sort may be expected that does not materially increase the cost and decrease the efficiency of the machine. Attention is turned therefore toward such schemes of regulation, or compensation, of the synchronous apparatus as would increase the maximum power. Among these is the use of reactors for locally controlling power factor and thus too the field excitation of the more important synchronous machines. However, the possible additional power thus obtained is limited, and, as it now appears, other and simpler methods which have greater promise will be resorted to.

Without expressing any assurance of practical application in the near future, it is noteworthy that a very substantial reduction in the effect of armature reaction has been actually obtained in a factory test by the use of the mercury-arc rectifier, as an adjunct in the excitation system. Its function is merely to supply field current in rigid proportion to the armature current, thus compensating for the latter *at the time it occurs*. By the nature of the circuits, and the variation of power factor, the space phase could not, in this particular case, be what was required. Nevertheless, the reduction in effective armature reaction, as evidenced by increased maximum power at the same voltage, under steady state, was of the order of 50 per cent.

Let the significance of this be clearly understood. Two maximum power (steady-state) tests were made on a miniature 250-mile line with a 225-kVA generator supplying a synchronous motor of the same size. One test was made with an ordinary vibrating regulator controlling the voltage of each synchronous machine; the other, with the rectifier as an adjunct. In the first, the power was gradually brought up to 120 kW at 2,000 volts at both ends of the line, 7 amperes on the motor field, 7.5 amperes on the generator field, which was the maximum power the system could carry; a further increase caused it to break out of step. Then the rectifier scheme was tried and the load was brought up to the same point, but this power was *not* the maximum; it was further increased at the same voltage to 154 kW, or an increase of 28 per cent.

This test is mentioned merely to illustrate the principle discussed; the point involved is the difference between the slope of a curve and the value of the function itself. It is not the value of voltage, but the slope of the voltage-power curve that indicates the degree of stability. If a system, controlled by vibrating regulators operating on the exciter is gradually loaded to imminent breakdown, the control can usually be taken over by hand and the same load held. In other words, although such regulators are highly effective in load transients in increasing the excitation as load is thrown on, they, nevertheless, do not significantly increase the steady state ultimate maximum power at normal voltage, over that corresponding to a fixed field current. The reason is that, even with the regulator, the slope of the voltage power curve, in the first moment, is practically the same as if the regulator were not operating; and if it should be different during a sudden transient, it must ultimately return to the steady state and thus to the slope corresponding to constant field. An exciter with a low time constant may expedite the regulation, but as long as the voltage must drop before the regulator contacts close, and the exciter field must be brought up before the alternator field current is changed, the compensation cannot possibly occur at the time the armature reaction occurs.

If this fact is not appreciated, it may be taken for granted that if the bus voltage is regulated, it may be assumed in calculations of maximum power that the voltage is *constant*. This assumption is justified only if $dE/dP=0$. It has even been proposed that by placing automatically regulated synchronous condensers along the line at given intervals, one may consider each of these sections as a unit, and that whatever power it is possible to transmit over one of them at the given voltage, can be transmitted, excepting losses, from one section to the other for a distance of, say, 1,000 miles. Now this would be possible only with infinite generators and also infinite condensers—*i.e.*, such that the slope of the terminal voltage curve against reactive kVA supplied by the condenser is zero. To illustrate magnitudes, the maximum power of a 250-mile line at 220,000 volts, infinite bus at both ends, is about 225,000 kW; of a 500-mile line, 130,000 kW. According to the proposal, with a condenser at the mid-point, it would be possible to transmit 225,000 kW, neglecting losses, over the entire 500 miles of line. Actually, a condenser at the mid-point of, say, 70,000-kVA capacity, would increase the maximum power only from 130,000 kW to 156,000 kW—not to 225.000 kW. This rather indicates what might be expected if the length were extended to 1,000 miles.

It is well to mention that consideration should not be confined to cases of long-distance straight-away transmission only. The problem, to a limited extent, relates also to power lines and networks of moderate distances, and the extent will undoubtedly become greater as the blocks of power to be transmitted continue to increase; or, indeed, to tie connections of central station systems—to any, in fact, in which the power to be transmitted approaches the power limit of the system under the operating conditions.

The progress to date has been little more than the demonstration of the principle in actual test, but it affords sufficient incentive to actively pursue the investigation when it is realised that for distances of transmission much above 300 miles the power limit with present equipment is such as to make such projects questionable from an economic standpoint, while, at the same time, the development of American resources will require the use of lines of this length in the near future.

New Electrical Devices, Fittings and Plant.

(Readers are invited to submit particulars of new or improved devices and apparatus.)

An Improved Draw-out Switchgear.

A new design of switchgear for 3-phase circuits and pressures up to 3,300 V, has recently been developed by Mr. GEORGE ELLISON, Perry Barr, Birmingham. The illustration, fig. 1, shows one of several switchboards supplied to a South Wales colliery. It is made up of eight units for one incoming and seven outgoing feeders. Each one is suitable for 200 A, and comprises an automatic circuit breaker, the necessary instruments and bus-bars. They are joined together by the bus-bar chambers and links. The gear is claimed to be freely accessible for inspection and adjustment, in accordance with the British standard specification No. 116, without resort to compound filling. The breaker element of each unit can be

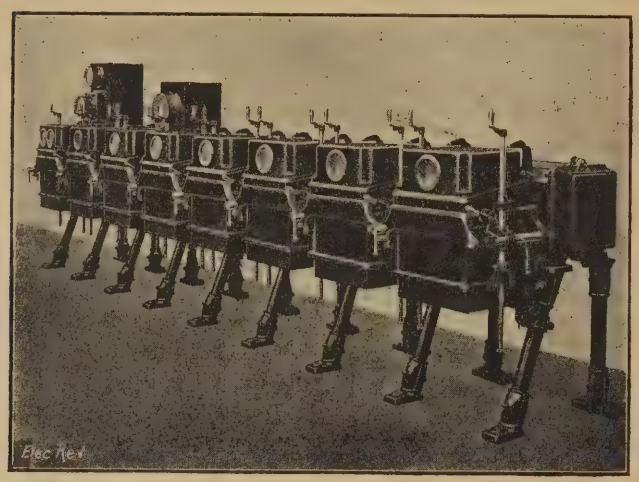

Fig. 1.—Draw-Out Unit Switchgear.

drawn out for isolating and the oil tank lowered without the use of auxiliary apparatus. Interlocks prevent access to current carrying parts unless the breaker is isolated. The trip coils are oil-immersed and the overload coils are direct connected in the main circuit; the breaker is operated by one handle, and easy operation is claimed without complication. The circuit is broken rapidly by two breaks in series, each 3 in. long, and the oil head is 6¾ in. above the points of break, assuring the safe rupture of high short-circuit currents; a welded steel tank is reinforced to withstand the shock of such an occurrence. A breaker may be entirely removed for overhauling and another mounted in its place if desired, or when the breaker is removed the aperture in front of the bus-bar chamber may be closed by a cover which can be locked up. Similar units may be arranged for the control of h.p. induction motors, in which cases the breaker is mechanically interlocked with a standard "Ellison" rotor starter erected in conjunction.

An Electric Sand-Pipe Heater.

The device illustrated in fig. 2, the Universal electric sand-pipe heater, is designed to keep sand pipes on locomotives, street cars and so forth, from clogging at the lower ends, and

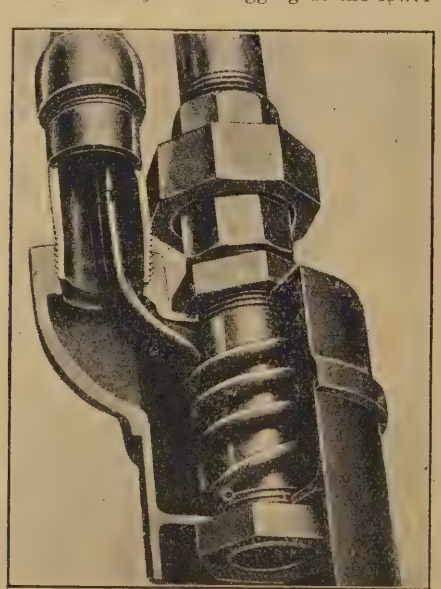

Fig. 2.—Sand-Pipe Heater.

has recently been patented in the United States. In stormy weather, the lower end of the sand pipe is always wet and it is a well-known fact that dry sand will not flow from a wet pipe without part of the sand sticking to the side of the pipe, eventually closing the outlet. The function of the device is to keep the orifice dry, permitting a flow of sand at all times, and thereby insuring full tractive effort and maximum adhesion for braking when needed. The heater is a simple device, screwed on the lower end of the sand pipe, simply making a shell which surrounds the pipe. Inside this shell and touching the sand pipe is an electric heating unit, which is supplied from the headlight generator. The heating element is covered with asbestos lagging, thus filling the space between it and the outer shell as well as retaining the heat.

Two sizes of heaters are manufactured, using 64 and 80 watts; two heaters are used on a locomotive.

Laboratory tests on the device were recently made by a large eastern railroad in the United States. Pipes were set up as on a locomotive and sand box and valves provided for track sanding. Water was allowed to trickle down the pipe and a blast of air equivalent to a cross wind blowing at 30 miles an hour was projected against the end of the sand pipe. Sand was permitted to flow down the pipe every 10 seconds. Without the heater the end of the pipe was closed with a grouty sand in from 5 to 15 min., while with the heater there was no wet sand in the lower end of the sand pipe at the end of 1¼ hours.

At a later date a road test was made. A five-gallon can of water was placed on the running board of a locomotive and a hose extending down to a point near the lower end of the sand pipe was used to trickle water on to the pipe. In making a 50-mile run without the heater on, the pipe clogged up every five minutes, being cleaned out each time. On the return trip, the current was "turned on" and the pipe gathered no wet sand. Again, another test was made in the freezing room of the Penn. Cress Ice Cream Company at Cresson, Pa., U.S.A. The sander was operated at a temperature of zero, with water trickling on the sand pipe. This was continued for two hours, at the end of which period there was nothing in the pipe.

The introduction of the electric sand pipe heater has solved the difficulty of obtaining a dependable flow of sand which arises from sand pipes stopping up, especially from the standpoint of safety. The patent is owned by a locomotive engineer engaged on the Pennsylvania Railroad.

An Electric Automobile-Engine Heater.

With the object of preventing the freezing of the water in the radiator and the engine cylinder jackets of motor vehicles when at rest in frosty weather, MESSRS. TURNCOCKS, Tunion Works, Aston, Birmingham, have recently introduced a simple device known as the Tunion electric automobile heater, fig. 3, which is intended to be placed under the bonnet of the car when the latter is put away for the night. It can be con-

Fig. 3.—Automobile Heater.

nected to an ordinary lampholder on a lighting installation, with a suitable flexible connection. The design of the heater is based on a current consumption of from 50 to 60 W, approximately the same as an ordinary metal filament lamp. The heat developed in the element is diffused over an area of 70 sq. in. of external surface from which to radiate. It is claimed that the working temperature is 200 deg. F. in free air. The heating elements are forced into an asbestos blanket under hydraulic pressure and firmly coated with polished bakelite.

Kaye Forced-feed Oilcans.

We have received a sample of a new "seamless" steel forced-feed oilcan which has been patented by MESSRS. JOSEPH KAYE & SONS, LTD., Lock Works, Leeds, who have recently received an order from the British Admiralty for 2,574 oil feeders made on this principle. Pressure on the thumb button ensures a jet of oil being forced to the spot required; the steel handle is riveted to the body of the can and the spout is double wrapped by a special process and is practically seamless. The top is fastened to the body of the can by means of serrated jointing. Various sizes are made, to hold from 1/16th to 2 pints, in steel and polished copper and brass.

An Appeal to the Student Engineer.

By W. F. MYLAN.

(*Abstract of Chairman's Address*; SHEFFIELD SUB-CENTRE *of the* INSTITUTION OF ELECTRICAL ENGINEERS.)

I WOULD like to make a special appeal to those, who, qualified in every way, are not yet members, to take the necessary steps to become attached in an appropriate grade to this Sub-Centre and thus make it fully representative of the electrical engineering profession in this area. In this connection I address myself particularly to the younger men who are at the commencement of their careers.

The problem of increasing the value of the Sheffield Students' Section has been and is constantly receiving the attention of your Committee, which feels that, however great its efforts and how extensive its plans, the results will not be satisfactory unless a greater number of the younger members will actively take part in, and support by their attendance, the various meetings, discussions, and visits to works that may be arranged; and, more important still, by coming forward with papers to be presented before their fellow members. The Institution grows stronger and of more value to its members each year and to the younger men who have their careers in front of them, active membership can be of the greatest possible help and assistance, no matter on what lines their work may be proceeding or in what branch of the industry it is their intention to embark.

There is no branch of engineering, with the possible exception of aviation, in which recent progress has been so rapid and in which there is such an ever-widening future, and it would be a mistake on your part to assume that because a paper is one which at the moment does not appeal to you, you may miss the meeting at which it is read. Very shortly after you may find that to you the subject dealt with has become one of extreme importance.

The preparation and presentation of a paper is one of the most useful pieces of work the young engineer can undertake. You will not only be doing a helpful service to your brother engineers by presenting to them in a brief and concise form the information you have collected together by reading, investigation and observation, but you will have improved your own knoweldge of the subject dealt with. Try and take a share in the management of the section; don't leave this work to a few individuals. The experience gained as an officer or committee man will be useful in many unexpected directions. If a visit is arranged you should particularly make a point of being present. Quite apart from what you will see and learn of the practical application of electricity, it is a matter of courtesy to show your appreciation of the privilege granted to your section by attending. The young engineer should seize every opportunity of seeing how the many problems met with in engineering have been solved in different ways, and the practical applications of the theories which have been presented before him in the lecture room or in the text book. I feel that some apology is necessary to the senior members for dealing with these matters in a somewhat elementary form; but the student of to-day is the associate member or member of to-morrow, and if we are to see the Institution of Electrical Engineers maintain its true position in the engineering world, too much encouragement and assistance cannot be given to the younger element.

The matter is of greater importance still since we as a nation must keep in the van of progress, and to do so we must see that our young engineer is given every help and encouragement to fit him for the battle of life. Twenty to twenty-five years ago it could be said with some justice that in many branches of electrical engineering our competitors were greatly in advance of us, not only in excellence of design, efficiency of operation and performance, but also in the skilful application of electricity. Furthermore, their prices were usually lower than ours. To-day, thanks to that characteristic of the British as a nation, never to admit defeat, it would be difficult to point to one important branch of the electrical industry and profession wherein we are not at least equal to, and in many instances vastly in front of, our competitors and able, given equal economic conditions, to compete with them on price. To keep this position we must continue to advance, and to do so must ensure an adequate supply of fully trained workers equipped in every direction. I believe we are just verging on the period which will be known in after years as the electrical age. Some countries are much nearer to it than we are. Several nations are consuming two, three, four, or even five times as many kWh per head of population as we are. This may be only a very rough method of comparison, but it certainly would appear that there is ample scope for the electrical industry, especially when it is remembered that we are still a great manufacturing country, although perhaps not quite holding the predominant position that we did in the past. To retrieve that place should be the aim of all, and electrical engineers can here perform a very great part. It behoves we senior members, therefore, to do our share in helping on the young electrical engineer, and I would suggest to all of you, who are in close contact with the young men of our profession as friends and employers, to use your influence to get them to take an active interest in the work and meetings of this Institution. Five years ago we had 36 students attached to this Sub-Centre, to-day we have 52. Many of the original 36 will by this time have passed forward to other grades of membership, but there must be still a large number of young engineers who ought to be members of the Students' Section, and I suggest that a little active personal propaganda work on the part of the senior element would soon result in our Students' Section becoming a very live and useful body.

This country is passing through very trying times. Many of our industries are struggling for their very existence, and whilst the electrical industry is perhaps more fortunate than many others, we all have to face the intense foreign competition. Much of this is unfair, much of it is due to unequal economic conditions; practically none of it due to the superiority of the article offered. To all of you, I make an urgent appeal; be your purchases little or great, make sure above all, whenever you can, that you are buying British goods. Whether a product of the home trade or of our Colonies do insist that it be British throughout.

Correspondence.

***Correspondents should forward their communications* at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

Is the Contracting Industry Degenerating?

In reply to Mr. T. Critchen's letter, I do not suggest that the regulations be slackened—what I would like to see would be the rule and regulation makers taking a few years' holiday and letting us get on with our work.

Had they taken their holiday in 1917 we should still be working on the Institution rules of that date, which are good enough for Mr. Fennell, of the Northwich Supply Company, and for many other members of supply companies; the mischief lies with the corporation supplies and the urban and rural districts, who each have their own book of rules, which in most cases they cannot enforce.

As an instance of the difference between 1917 and to-day, on a new job, the vacuum cleaner, iron, and radiator must be earthed (I have used all these things for eleven years without earthing them, without fatal or any other results, with three children growing up in that period). Once, however, the job is passed, it is open to the consumer to go to any shop or store and buy electrical devices, such as curling tongs, hair driers, violet-ray machines, radiators, &c., in many cases taking delivery over the counter; we, or any dealers, are not interested as to where they go so long as the sale is made. None of these items has an earth wire attached to it by the makers, and I am quite sure the dealers do not put one on, so that on a new job, we get some portion earthed and the later stuff not earthed; and if it is so dangerous, why are not the papers full of the accidents, fatal and otherwise, caused by unearthed apparatus?

Our only difficulty is to find out what the voltage is and if a.c. or d.c. is required, and that brings us to another difficulty, because in our area we have Altrincham 100 and 200 volts, Manchester 200 and 240, Salford and district 220 and 200, Ashton 240, Trafford Park 250, St. Annes 230; and it is only by careful cross-examination of the customer and knowing which is the new system and which the old, that we can fill an order.

I have sold many grosses of electric irons, hundreds of vacuum cleaners, radiators, kettles, &c., over the counter, having no further interest in the goods sold (unless they went faulty, when of course we heard about it); in this respect, why should we? We are competing with all the big stores in the country who are not contractors, but just purely salesmen.

I suppose the stores have the same sources of supply as the contractors, and in no single case is a piece of apparatus delivered to us with an earth wire—not even a washing machine, which most certainly should be earthed!

I am in entire agreement with Mr. Fennell and Mr. Critchen as to registration, and the sooner it is compulsory the better; at present the contractor is competing with wiremen and others working from private houses, carrying no stock, not helping the trade in any way, and probably out of business in a few months.

Manchester, *November 9th*, 1925. **E. O. Walker.**

Rural Electricity Supply.

In connection with this correspondence, it is interesting to note that the I.E.E. Informal Meetings Section, in its discussion on "How can the cost of Distribution be Cheapened?" elicited the fact that the Shropshire, Worcestershire, and Staffordshire E.P. Co. is erecting overhead distribution lines at about £400 per mile. This is much lower than the cost in many other parts of the country. However, it would be interesting to know why the cost could not be further very considerably reduced. In Sweden, as one instance, the cost of a line for a similar purpose is only about £100 per mile. What modifications should be made in this country to get somewhere near this figure without sacrificing public safety? It is not essential, for rural work, to provide an absolutely uninterrupted service; this fact enables costs to be reduced.

I know of lines in this country that have cost but little more than the Swedish example—but they have been erected without official sanction. However, I have constructed one at a similar cost, for which I have had the informal sanction of the

Electricity Commissioners. Hence it is not this body that stands in the light. It is further claimed in this correspondence that it is not the I.E.E. regulations or the P.O. Telephone Department, that put any really serious difficulties in the way.

It is a matter of very great importance to this country that the cost of overhead lines should be reduced; have any readers of the ELECTRICAL REVIEW any concrete suggestions that will facilitate the attainment of this end?

R. Borlase Matthews.

East Grinstead, *November 14th*, 1925.

The Cost of House Wiring.

Referring to "Inquirer's" letter under the above heading in your issue of the 13th inst., this we read with interest, and we would like to give our experience that as regards house wiring we find our keenest competitors are members of the E.T.U. who, when working on their own behalf, will complete a seven-point job in about 9 or 10 hours, but when taking 1s. 10d. per hour from us for their labours, our experience is that they take nearer one week; hence the impossibility of such competition for this class of work.

Heath Pritchard, Ltd.

London, *November 14th*, 1925. S. E. GRUBB, *Director*.

Legal.

Metropolitan-Vickers Electrical Co., Ltd., v. British Thomson-Houston Co., Ltd.

THE Court of Appeal, consisting of the Master of the Rolls and Lords Justices Warrington and Sargant, on November 11th reserved judgment in this case upon the appeal of the plaintiff company from the judgment of Mr. Justice Lawrence in the Chancery Division, holding that Rosenberg's patent for improvements relating to synchronous dynamo-electric machines, of which the plaintiffs are the owners, had been anticipated by Tesla's U.S.A. publication, but that if it had been valid it would have been infringed by the defendants, the British Thomson-Houston Company, Ltd.

Radio Instruments, Ltd., v. Super Radio Co.

IN the Chancery Division on November 10th, a motion in an action by Radio Instruments, Ltd., against the Super Radio Co. was mentioned to Mr. Justice Tomlin.

Mr. BOUSFIELD, for the plaintiffs, said it had been agreed to treat the motion as the trial of the action and the defendants would submit to a perpetual injunction with costs.

Radio Instruments, Ltd., v. Lesadd & Sons.

IN the Chancery Division on November 13th, Mr. Justice Tomlin had before him a motion by Radio Instruments, Ltd., for an injunction restraining Lesadd & Sons, Ilford, from infringing its patent in relation to radio instruments by selling them below the stipulated price.

Mr. BOUSFIELD, for plaintiffs, said that the defendants were prepared to treat the motion as the trial of the action, to submit to a perpetual injunction, and to pay two guineas as damages and 20 guineas as costs.

His LORDSHIP made an order accordingly.

Postmaster-General v. Ford.

THE adjourned summons obtained by the Postmaster-General against Mr. Robert Moffatt Ford, Albert Gate, S.W., came before Mr. Mead at the Marlborough Street Police Court on November 12th. The charges were that the defendant had established a radio station, installed apparatus, and worked the latter without a licence. Mr. Ford pleaded "Not guilty," and conducted his own defence. Evidence was given by Post Office officials of the discovery of the apparatus in defendant's house. Mr. E. H. Shaughnessy, assistant engineer-in-chief of the G.P.O., said that the apparatus found had been tested and ascertained to be capable of receiving messages, when a "cat's-whisker" and telephones were added. The witness said that any combination of apparatus which would receive radio signals constituted a "station," and unassembled parts were "wireless apparatus."

As defendant said that his closing statement would occupy some time, the magistrate again adjourned the case for a fortnight.

Consolidated Electrical Co., Ltd., and Allen & West v. London Woollen Co., Ltd.

IN the King's Bench Division, on November 12th, Mr. Justice Avory gave judgment in favour of the plaintiffs in this case, holding that they were induced by misrepresentation to take up certain shares in the defendant company.

False Pretences Charge Dismissed.

AT the Marlborough Street Police Court on November 13th, the Magistrate discharged Hyman R. Spinney, electrical engineer, who was charged with obtaining by false pretences telephones valued at £412 10s., the property of the General Radio Co., Ltd.

Trade-mark Applications.

THE following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from November 11th. In the case of foreign applications, the names and addresses of the British representatives are also given.

Superselectodyne. No. 460,255. All goods in Class 8. No. 460,257. All goods in Class 13. Supertetradyne. No. 460,258. Superpentadyne. No. 460,259. Superhexadyne. No. 460,266. All goods in Class 6.—Société Française Radio-Electrique, 79, Boulevard Haussmann, Paris. (Marks & Clerk, 57-58, Lincoln's Inn Fields, W.C.2).

Audalion (lettering and design). No. 457,674. Class 8. Loud speaker devices and telephonic receiving instruments.—Lee de Forest, 220, West 42nd Street, New York, U.S.A. (Frank B. Dehn, 103, Kingsway, W.C.2).

Kathodofone. No. 460,426. Class 8. Philosophical and scientific instruments and apparatus for useful purposes.—Die Tri-Ergon Gesellschaft, 7, Tiefenhöhe, Zurich, Switzerland (A. M. & W. Clark, 53-54, Chancery Lane, W.C.2).

Kenmac. No. 461,327. Class 8. Apparatus for use in radio-telegraphy and telephony.—Kenmac Radio, Ltd., 2a, Dalling Road, Hammersmith, W.

Davreach. No. 461,928. Class 8. Radio-telephonic apparatus.—E. H. Millington, 5, Vaughton Street South, Birmingham.

Hitensite. No. 462,558. Class 8. Paper-insulated electric cables. Kalanoid. No. 461,068. Class 50. Electric insulating material composed of a mixture of levigated earth, oil, waxes, and bitumen. Emfinite. No. 462,775. Class 8. Electric cables.—Callender's Cable and Construction Co., Ltd.

Milliwatt. No. 458,202. Class 11. Electric heating cushions and pads.—Richard Heilbrun, 27 28, Lindenstrasse, Nowawes, Germany (Mathys & Co., 52, Chancery Lane, W.C.2.)

Musikon. No. 460,466. All goods in Class 8.—Will Day, Ltd., 19, Lisle Street, W.C.2

Phonalion. No. 461,296. Class 8. Philosophical and scientific instruments and apparatus for useful purposes.—The G. & L. Electrical Supply Co., Ltd., 1, Warwick Court, High Holborn, W.C.1.

Music Master (lettering and design). No. 460,969. Class 8. Receiving sets, sound reproducers and amplifiers, all for use in radio-telephony, and electric batteries.—The Music Master Corporation, 128, North Tenth Street, Philadelphia, U.S.A. (F. W. Golby, 3, John Street, Bedford Row, W.C.).

Published Specifications.

Compiled expressly for this journal by Patent Agents.
The name of the applicant's patent agent, if any, will be found on the printed specification.
The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

The Weir Report Foreshadowed.

SELDOM has even a Beama dinner proved so fruitful of material for thought and discussion as that which was held by the British Electrical and Allied Manufacturers' Association on Thursday last week. The speeches reached a high level of interest and significance, and covered a wide range of subjects.

The most notable pronouncement was no doubt that of Lord Weir of Eastwood, chairman of the Committee of Inquiry into the electrical situation appointed by the present Government, which presented its report to the Minister of Transport on May 20th, 1925. Lord Weir professed to forget the famous report, which is still kept secret, and to give his own personal opinions; but Lt.-Col. Wilfrid Ashley, responding to the toast, said that Lord Weir had laid bare "its minutest details," and whilst we must make allowance for the badinage of an after-dinner speech, it cannot be doubted that the main principles of the report will eventually be found to correspond closely with the substance of Lord Weir's "personal views." It is important, therefore, to examine his remarks with care.

To begin with, he emphasised the fact embodied in the first paragraph of our leader last week—that continued uncertainty as to the future policy of the Government was most unsettling, and highly detrimental to electrical development. No doubt, as the Minister of Transport assured his audience, the matter is receiving the daily attention of the Cabinet. No doubt, too, as he indicated, and as we surmised in the same leader, it is the question of finance that blocks the way; but whatever the reason, it cannot be too strongly urged that the hands of the Electricity Commissioners and of the electrical industry in general are paralysed by the sense of impending changes which prevails, and the impossibility of making rapid progress so long as the intentions of the Government remain unknown. As Lord Weir said, such conditions "breed lack of confidence, and irresolution, and they stultify progress." Unfortunately, it is no new thing; repeatedly in recent years the electrical industry has been subjected to a similar trial of its patience, and might say with Mercutio to Parliament: "A plague o' both your Houses!"

Returning to Lord Weir's speech, he said he was sure "that effective and efficient development of our national resources will be ruined if it becomes either a political issue or is studied from a narrow or parochial stand-

point." Here we have the two horns of the dilemma with which the electrical industry is confronted; indeed, it appears likely to be impaled upon both of them. The Electricity Commissioners complain that the existing undertakers will not surrender their parochialism, and, on the other hand—that which we have often anticipated in these columns with dread—there is only too great a danger that electricity supply will become the plaything of politicians. These are the two great dangers by which we are threatened. On the one hand some of the schemes of the Electricity Commissioners have already been wrecked on the rock of parochialism, and now we see the rest in danger of being sucked into the whirlpool of political machinations.

Naturally we welcome Lord Weir's emphatic declaration that we must look to electricity as the provider of motive power for industry; but no less cordially we approve of his denunciation of the illusion that British industry can be restored to unbounded prosperity by the adoption of electric power. As we have already pointed out, under existing conditions, with few exceptions, the cost of power forms but 3 or 4 per cent. of the cost of the finished product, and even if electricity were given free to manufacturers they could not appreciably reduce the selling price of their goods.

The real need of the moment is not to cheapen electric power—with all respects to Lord Weir it is already cheap—but to utilise it to far better purpose. That is to say, our manufacturers should adopt every available means of increasing the use of power in their works, by substituting power for manual labour in every process where it is possible, as has been done in the United States, with the result so often quoted that there the consumption of electricity per head of population is more than twice as great as in this country. This was the case when the report of the Ministry of Reconstruction was issued in 1918, and since that date the ratio has been increased.

Turning to the question of providing an ample supply of electricity, Lord Weir rightly rejects the idea of erecting giant power stations at the pit-heads in conjunction with plant for the low-temperature carbonisation of coal. The pit-head plant scheme has been with us for a quarter of a century, and has been repeatedly shown to be uneconomic, but we are glad to see that he is full of confidence as to the future pre-treatment of coal, and that he regards it as essential that any new electricity scheme shall be so devised as to enable coal pre-treatment to be dovetailed into it with facility when the time is ripe. We also welcome his statement that every effort must be made to utilise to the best advantage the enthusiasm, enterprise and energy which the great municipalities and power companies have hitherto displayed in developing the supply of electricity. The most contentious passage in his speech was that in which he declared that the standardisation of frequency must be carried out at the earliest possible moment, even if it involved a heavy outlay. There is much to be said on both sides of this thorny question. Apart from the merits of the subject, we are inclined to attach considerable weight to the cat which Col. Ashley let out of the bag in his reply, namely, that finance is vitally important, and it is not easy to see where the money is to come from to pay for such standardisation.

To sum up, Lord Weir advocates the generation of electricity from "waste heat," and the provision of "an open market" for it—which means a network of mains; the development of large existing undertakings; legislative facilities for the construction of transmission lines; and the standardisation of frequency. Hence he puts forward no new or revolutionary propositions; all these questions have been discussed, and the first two items are already recognised as sound practice (within reasonable limits—we do not regard the interlinking of distant power stations as reasonable). The demand for relief in the matter of wayleaves and regulations for overhead lines is insistent, and we hope we shall see it satisfied. The standardisation of frequency and the erection of interconnecting mains appear to be the items involving financial assistance from the State, and we cannot profess to be enthusiastic in support of either of them.

The Human Being in Industry.

The presence of the Prime Minister, the Minister of Labour, and a prominent member of the late Labour Government, at the dinner of the National Institute of Industrial Psychology on November 12th, taken in conjunction with the evident revival of interest in the "new spirit in industry" shown by numerous writers in *The Times* and other papers lately, is a gratifying indication that the human side of organised industry is once more attracting that attention which is its due.

It will be remembered that during the strenuous conditions and the scarcity of labour that prevailed during and immediately after the war, much attention was given to the question of co-operation between the two, or three, parties constituting the modern industrial machine. The several Whitley Reports, the Garton Foundation Memorandum, and the inauguration of movements in the direction of the organisation of brain workers, will be within the recollection of our readers.

While attention was given at that time to remuneration, hours, and conditions of labour, the last of these three terms was usually taken to mean the general policy and control of industry, or at least of industrial concerns. The question whether individual workers were comfortable or otherwise at their particular jobs was not yet prominent in the minds of those who were thinking about the matters involved. The study of the efficiency movement had made some progress, and process specifications, some of which caused more irritation than they were worth, had been prepared by many zealous and well-meaning persons.

It must have been, as we understand, about half-a-dozen years ago that a few people, realising that, while the whole is greater than its part, the whole is made up of its parts, came together and founded the National Institute of Industrial Psychology. They resolved to begin the study of mass problems by studying the individuals of whom the mass is composed. They understood (and it is, of course, obvious when attention is drawn to the fact) that it is not sufficient to see to it that Bill Jones works for eight hours only, and is remunerated for so doing at standard rates. If he has to work in a cold, ill-lighted, or inconvenient shop, he will be as inefficient, as discontented, and as difficult to handle as if he is under the thumb of a tyrannical and grasping employer.

The methods upon which the Institute proposed to work commended themselves to many thoughtful persons. Amongst the foremost of these was the Right Hon. the Earl of Balfour, who consented to become, and still is, President of the Institute. These methods have proved so right, and so practical in every sense, that within six years of the Institute's birth we see, as we began by saying, Mr. Baldwin, Sir Arthur Steel-Maitland, and Mr. J. H. Thomas as the principal speakers at its annual dinner.

Such an Institute as this ought to be properly housed, to have an adequate library, and abundant facilities for research into its problems, which concern us all very intimately. Any firm can become a member and receive the *Journal* for the sum of £1 per year; any individual can become an associate for five shillings a year.

Several leaders of the electrical industry were present.

The Electrical Purification of Water.

Elsewhere in this issue a description is given of an interesting electrical process for the purification of water, which deserves more than passing notice. For many industrial processes distilled water is a necessity, and in some electricity works the make-up feed water for the boilers has to be purified by distillation, entailing a considerable expenditure of fuel. If the inventor's claim that the electro-osmotic process costs only one-fifth as much as distillation with coal is substantiated, it seems probable that the system will prove useful not only to the users of distilled water, but also to electricity supply authorities as an ideal type of off-peak load. It is true that it may not assume any great magnitude, but every aid to the improvement of load factor should be welcomed.

Electrical Gifts for Christmas.—I.

Some Notes and Suggestions.

We sincerely believe that British sellers of electrical appliances have not yet fully awakened to the possibilities presented by the observance of "times and seasons." It is regrettable that we should have to refer to the United States again, but we are compelled to say that things are ordered much better there in this direction. Dealers in that country not only realise that popular festivals can be made to bring business to them, they actually institute "seasons" for the purpose. For instance, they discovered that there were more marriages in June than in any other month; accordingly during May and June every retailer of electrical appliances advertises, each in his own way, presents for "June brides." Remarkable reports have been received of the results of this particular "stunt." Then, in addition to the religious festivals, which Americans celebrate in common with ourselves, they have a number of civil commemorations, *e.g.*, "Thanksgiving" and "Independence" Days, all of which are turned to good account by the pushful American dealer.

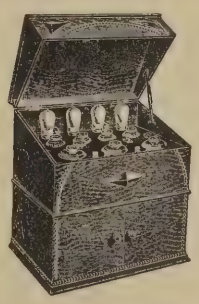

Fig. 5.—A 4-valve Radio Set.

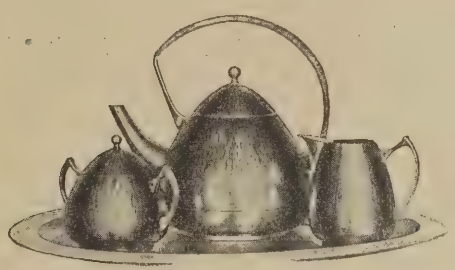

Fig. 6.—An Electrical Tea Service.

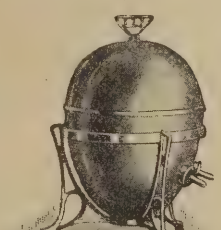

Fig. 7.—An Egg Boiler.

Fig. 8.—The "Eutherme" Toaster.

Fig. 9.—A Bed Warmer.

Fig. 10.—An "Electric" Toilet Mirror.

Fig. 11.—A "Juniorlite" Adjustable Lamp.

Fig. 12.—A Table Lamp.

While we believe that much more might be made of these special seasons, we realise that at Christmas, at least, British electrical dealers do make efforts to impress the public with the value and utility of electrical gifts. We think that utility should be the first consideration stressed, for in these days of money scarcity a useful gift is worth many times one that is merely a token. Next to utility we would place decoration, as this is an attribute of a great deal of electric lighting equipment. If the two can be combined, as is so often the case with electrical appliances, so much the better.

Apart from domestic appliances, no doubt radio apparatus will be in great demand this Christmas. As in the case of household devices, radio sets and components offer a wide choice. This year, therefore, in our suggestions for Christmas gifts we have included a few examples.

While novelty is no doubt a *sine quâ non* to many purchasers of Christmas presents, the standard electrical lines possess sufficient attraction for the majority. Therefore, although we have endeavoured to include as many new ideas in this article as possible, we have also introduced a number of familiar appliances to give an indication of the many directions in which Christmas gifts can be, and will be, sought.

We must not neglect to remind dealers of the opportunities which are open to them of arranging seasonable and effective window displays. Electrical traders must not be behind in this respect, nor, indeed, is there any excuse for them to be. Practically all of the large manufacturers of domestic appliances are willing to provide material for these displays, and the British Electrical Development Association exists to offer suggestions and suitable "literature" to drive home the idea of electrical Christmas gifts. There is still ample time to make the necessary arrangements for this display and publicity matter, for, generally, existing stock can be put forward as suitable presents.

The British Thomson-Houston Co., Ltd., considers that its small transformers are suitable Christmas presents. One of them, the "All-Nite-Lite" transformer (fig. 1) is certainly a useful gift. This device plugs into the ordinary lampholder and steps down the voltage for the purpose of supplying a 6-V bulb which is connected in the secondary winding. It is made for primary voltage ranges of 100/150 and 200/250, and is thus available for practically any a.c. supply. Another form of transformer is that illustrated in fig. 2, which is designed for the operation of electrical toys (such as railways), or other purposes for which low-voltage alternating current is required. The "Tungar" transformer-rectifier (fig. 3) is a very familiar device, and is very useful for home battery charging.

Messrs. Ward & Goldstone, Ltd., suggest two extremes (from the expense point of view). A simple and cheap device is the heating (or soothing) pad depicted in fig. 4. For those with longer purses the 4-valve cabinet receiver shown in fig. 5 is a gift which would be greatly appreciated. In the Jacobean style, the set is a handsome addition to the furniture of a room as well as an efficient radio set.

Some beautiful appliances are turned out by the British B.A.G., Ltd. Among them is the tea service illustrated in fig. 6. This consists of an electric tea-pot (2 pints, 450 W) in hammered antique brass, accompanied by a cream jug and sugar bowl to match, all on a tray of the same material. The egg boiler (fig. 7) is rather novel. It is itself egg-shaped, and contains a holder for four eggs; the material is nickel-plated brass and the loading is 225 W. Fig. 8 shows the firm's "Eutherme" toaster. This also has a nickel finish, and two most ingenious bread holders are provided which can be easily reversed without danger to the fingers. The loading in this case is 400 W. Another useful appliance is a bed warmer (fig. 9), a nickel-plated device on the lines of the antique warming pan, a 30-W element taking the place of the live coals.

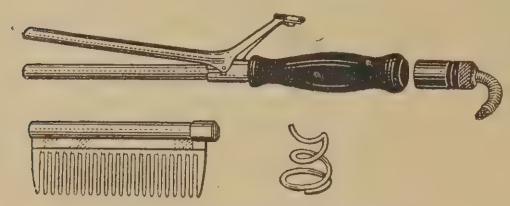

Fig. 13.—Hairdressing Equipment.

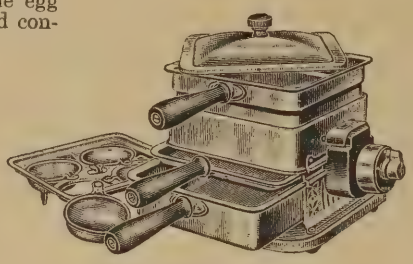

Fig. 14.—A Table Cooker.

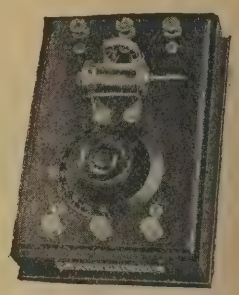

Fig. 15.—The "Junior" Crystal Set.

Fig. 16.—An Electric Massage Vibrator.

Fig. 17.—The "Handilite" Pocket Lamp.

Fig. 18. A Travelling Iron Equipment.

Messrs. Berry's Electric, Ltd., have introduced a new form of their toilet mirror (fig. 10). This is intended to stand on a table and a small electric lamp behind a lens projects a beam of light on to the face. The lamp also prevents obscuration of the mirror by the condensation of the breath.

While it may be said that most domestic appliances are gifts for ladies, that illustrated in fig. 13 is undoubtedly of this class. Not only can the device be used as curling tongs, a special form of comb can be fitted, as well as a little addition of whose object we are ignorant. This and the articles shown in figs. 12 to 14 are supplied by Messrs. L. G. Hawkins and Co., Ltd. Fig. 12 is a decorative but serviceable table lamp; and fig. 11 is a "Juniorlite" adjustable lamp. A table cooker is shown in fig. 14. This appliance is capable of performing more than its size (6¾ in. square) would suggest; it has a 650-W loading.

As was to be expected, the General Electric Co., Ltd., has a number of lines which are suitable for presentation this season. The company has a wide selection of radio apparatus, elaborate and simple, and an example of the latter class is the "Junior" crystal set shown in fig. 15. Electric massage is becoming very popular and it can be applied at home by means of the vibrator set depicted in fig. 16. A very handy equipment is the travelling electric iron outfit (fig. 18); an adjustable connector permits the iron to be used on 100/125-V or 200/250-V circuits and the set weighs only 2½ lb. The short-lived flash lamp battery can be dispensed with by the employment of the "Handilite" pocket lamp illustrated in fig. 17.

The development of table appliances has reached such a pitch that the kitchen need not now be relied upon to provide breakfast. With the equipment shown in fig. 19, a table plate made by the Jackson Electric Stove Co., Ltd., the morning meal can be prepared "sitting." The hob surround into which the actual cooker is fitted can be omitted if desired, but it forms a useful addition. The loading can be either 800 or 1,300 W as required, and a three-heat switching arrangement (as illustrated) can be fitted.

An electric kettle is another useful table appliance. Only electric kettles can properly be boiled at the meal table, for spirit stoves are prone to emit odours and incur accidents. Fig. 20 shows a kettle made by Premier Electric Heaters, Ltd. A "table" appliance of a different order, made by the same company is the iron illustrated in fig. 21, which, it will be observed, has a thumb-rest which relieves the strain on the hand, and a strong connector and flex guard.

Fig. 19.—A "Jackson" Table Cooker.

Fig. 20.—An Electric Kettle.

Fig. 21.—A "Premier" Iron.

American Christmas Gift Expenditure.—*Electrical Merchandising* calculates that the average American family expends $100 upon Christmas gifts, basing its estimate upon information gathered by department stores. Our contemporary says:—"With dozens of different useful and attractive articles in stock—with merchandise that appeals to the Christmas buying spirit, beyond all others—certainly the electrical merchant is in a strong position for the Christmas market ahead. It is up to him and to the aggressiveness of his selling during the next few weeks as to how much of each $100 Christmas appropriation will be rung up on his own cash register."

While it cannot be said that the average English family can afford to spend £20 upon Christmas presents, the rest of the above-quoted note may be applied to English conditions. Particular attention should be paid to "aggressiveness" of selling for only by this means will maximum results be obtained.

Modern Electric Cookers.

A Review of the Recent Improvements in Electric Cooking Stoves.

(*Continued from page* 810).

We illustrate in fig. 9 the construction of the element unit of the "Cosmos" boiling plate, to which reference has already been made. It is covered by a slotted metal top plate arranged so that the slots come between the element spirals. The General Electric Co., Ltd., is now supplying only the open type of boiling plate in its latest cookers. The "Magnet" plate, fig. 10, consists of spirals of nichrome wire wound on and held in a

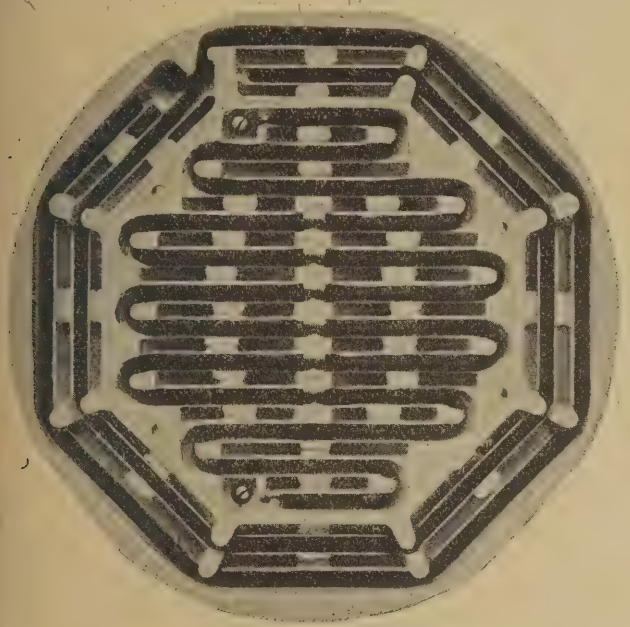

Fig. 9.—Semi-enclosed Plate.

specially constructed fireclay base. It is contained in a metal frame which can be easily removed by releasing four screws and the terminal bolts.

A particularly interesting design of the enclosed pattern of boiling ring is that adopted by Messrs. Belling and Co. in their latest production, the No. 6 "Belling" cooker. The makers have incorporated a new design of element unit, known as the "Honeycomb" (fig. 11). It is built entirely of fireclay, nickel chrome, and cast iron. The element spirals are threaded through holes

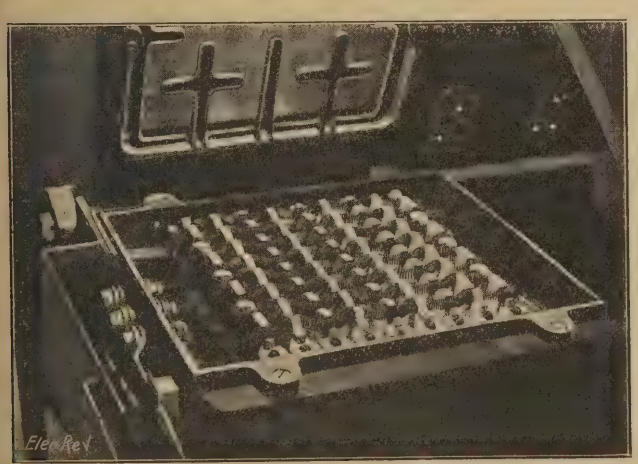

Fig. 10.—Open Plate.

in rectangular bars of fireclay, the holes being so placed that the bars are brought flush with one another, thus presenting a flat surface direct to the cooking utensils. In this way the spirals are fully protected by the fireclay in which they are housed, it being claimed that the sections are packed so closely that any spilt liquids cannot possibly reach the wire. The bars are made of fireclay with good heat-conducting properties at red-hot temperatures. The spirals are made off at plug-in terminals, and the whole is contained in a metal frame, so arranged that it may be "slid" into position in the cooker on rails or guides specially provided; plug sockets are suitably placed in the cooker framework to receive the plug terminals. The principal interest in this plate is that, while it is claimed to be of the fully-protected pattern, only the fireclay, in which the elements are contained, intervenes between the spirals and the cooking utensil. The insulating material is made in sections to accommodate contraction and expansion and to assist in radiation. The "Honeycomb" plate is arranged so that it may be used at both the top and bottom sides, hence being suitable for both boiling and grilling operations. Deflector

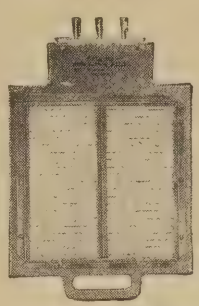

Fig. 11.—Closed Plate.

plates are arranged at the top and bottom of the unit, so that if only one side is required, the other side may be covered, and the whole of the heat from the elements deflected in the direction necessary. The spiral ducts are arranged very closely in the "Honeycomb" plate, and a large quantity of heavy gauge wire is used, giving it a claim to longer life than in the case of a short fine wire, also that in relation to the current density in the wire a higher temperature is obtained. It is also claimed that oxidisation is largely reduced owing to the wire being practically excluded from contact with moving air.

Generally speaking, the developments in the griller have followed closely those of the boiling plate as far as the complete electric cooker is concerned. An important improvement adopted in several makes is that where, while the bulk of the heat from the grilling elements is directed downwards to the crown plate, pro-

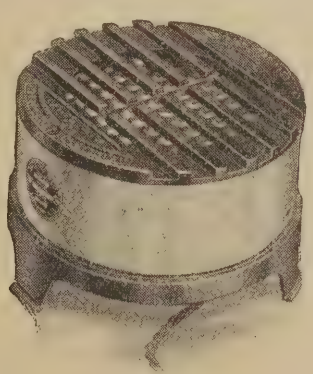

Fig. 12.—Boiling Ring.

vision is made in the hob plate above the elements for utilising the upward or otherwise waste heat for warming operations. In the more recent "Jackson" cookers, the grilling plates are attached direct to the hob plate. In the latest "Xcel" cookers, the grilling unit is composed of parallel fireclay bars through which nickel chrome spirals are threaded. Plug-in contacts are employed, as in the case of the boiling plates, 3-pin plug terminals being provided. The elements are wired so as to give 3-heat regulation, and a damping plate is provided so that the unit can also be used as an additional boiling plate. The damping device will slide underneath the

griller if it is desired to use it for boiling only; or, if it is used as a boiling plate while grilling operations are in progress, the damping plate will, of course, be removed altogether.

Apart from the boiling plates incorporated in the construction of the usual cooker, several firms are placing

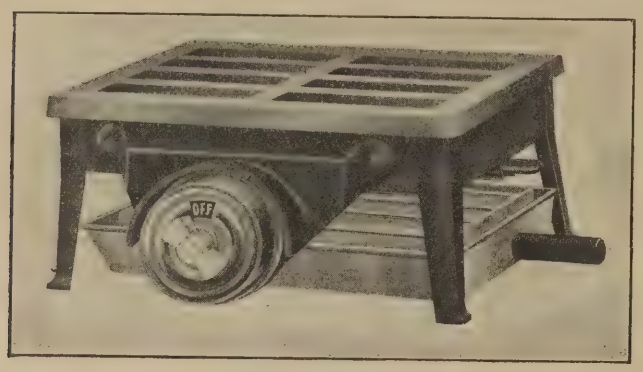

Fig. 13.—Table Plate.

on the market separate portable boiling and grilling units. These have necessarily to be made more substantially than in the case of the stationary unit, and probably to gain this end, something in the way of cooking efficiency has to be surrendered. Nevertheless, a strong portable cooking plate proves of great value in many cases. Fig. 12 shows such an apparatus made by Messrs. Belling & Co. It is described as the No. 7 boiling ring, and is of the open type. The frame is of fine-grain cast-iron, and the whole device is constructed to stand rough kitchen use. The Arora Co. has also produced an interesting boiling plate unit. It is of the open type, contained in a cast-iron frame, and consists of three sector-shaped elements of 500-kW capacity each. It is provided with a 4-heat control. The table plate shown in fig. 13 is an apparatus of this description, made by the Jackson Electric Stove Co., designed for both grilling and boiling.

It is a widely supported claim that cooking by means of electricity results in the nutritive value of the foodstuffs being retained in them in a manner superior to that in the case of other methods of cooking. It is in the oven that the general support to this claim is usually found. There are, in the main, two schools of thought also with reference to the position of the heating elements in the oven. On one side it is declared

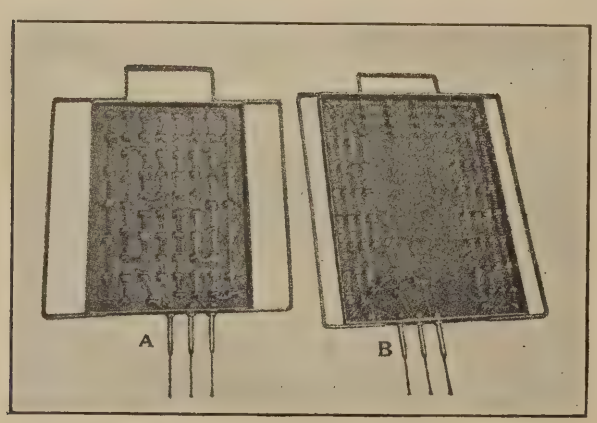

Fig. 14.—Oven Elements.

that the best results are obtained if the elements are placed at the top and bottom of the oven, it being maintained that a better heat circulation is produced. On the other hand there is the view that an even distribution of heat is necessary throughout the oven and that this can only be obtained with the elements placed at the sides so that the greater amount of heat is emitted near the bottom. In the "Universal" cookers the elements are placed at the top and bottom. The top element, which is of the open or exposed variety, is intended to be used for grilling purposes other than for heating the oven. Both units are employed to bring the oven quickly to the desired temperature, when the upper one may be "switched off."

Fig. 14 illustrates the construction of the oven elements, A, top, and B, bottom. They are arranged on the plug-in principle and are suitably connected for 3-heat regulation. The broiler element has a maximum loading of 1,500 W, and the consumption of the lower unit is 2,000 W.

Horizontal parallel side elements are adopted in the "Xcel" cooker. These are of 350-W capacity, and are standardised to fit on to standard busbars, and, as is the modern tendency, are so located as to give a maximum bottom heat, with two element bars nearer the top for browning. These are all protected by sheet-steel gate linings arranged on hinges so that they may be readily cleaned or removed altogether. It is claimed that the cooking temperature is reached in approximately 18 minutes from cold, and that with the switch then in the low heat position the cooking temperature will be maintained. The arrangement and housing of the elements in the Jackson cooker are very similar to those in the last-mentioned apparatus. The horizontally-arranged elements are attached to vertical solid bars by means of lugs and bolts. An extension of the lug is taken along the back of the clay giving it a stiffening. The clays are of a special mixture of fireclay and are

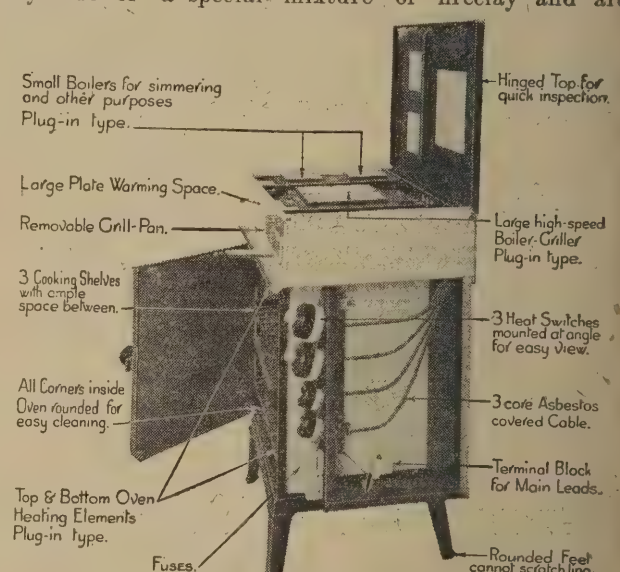

Fig. 15.—Construction of Cooker.

standardised. They are made up of three pieces to allow for expansion and easy replacement. The spirals, which can be obtained separately and rewound on the clays, are made off under nickel washers. They are wound in grooves in the clays, in which are provided small pips, which are gripped between the coils, holding the latter in position when they are subjected to abnormal heat expansion. As in the case of the boiling plate, the elements are interchangeable throughout 14 sizes of cookers. Fig. 1, p. 766, affords an excellent idea of the construction of the modern "Jackson." The side oven elements are spaced so as to radiate the bulk of the heat at the bottom of the oven. In the smaller ranges three elements are provided on each side, two at the bottom and one in the centre; in the larger sizes four elements are provided spaced out on the same lines.

Messrs. Belling & Co. adhere to the practice of installing the elements at the top and bottom of the oven. They have adopted the plug-in element similar to the arrangement in connection with the "Honeycomb" elements for the boiler and grid plates. The sockets are held in porcelain bushes in the back of the oven, and the element is slid into position on rails or guides. Fig. 15 shows the general construction of the new No. 6 "Belling" cooker.

All the general cooking in the oven of this cooker is done by the bottom heater only, which, with its heat-dissipating and protecting shutters, results, it is claimed, in an even cooking temperature throughout the oven without any burning. The top heater, which is used to give a quick initial "heating-up" and for the final browning, can also be used for grilling purposes.

(To be concluded.)

Electricity Supply in Isolated Villages.

An Interesting Installation in Norfolkshire.

The possibilities of supplying outlying villages with an efficient service of electricity for lighting and power purposes are being tested with very successful results in the village of Brundall, which lies about seven miles to the East of Norwich, in Norfolk. The village is exceptionally well served with transit facilities by two railway stations on the L.N.E.R. system, and a frequent service of motor-'buses to and from Norwich and Yarmouth. It has also the additional advantage of being pleasantly situated on the north bank of the River Yare. In 1921 the population of Brundall amounted to 633, since when it has probably increased by 50 per cent., as extensive building operations have been going on for some years, and are still in progress. It had been felt for a considerable time by some of the residents that an adequate supply of electricity was essential in the absence of gas or any other form of lighting or heating supply. So on February 25th, 1924, a company was formed with a capital of £4,000 to carry out an agreement made with the Norwich Corporation, by which energy would be purchased in bulk and distributed by the company from its own mains. Application was then made to the Electricity Commissioners for a Special Order, to give the company distributing powers in the parishes of Brundall, Blofield, and the surrounding area. Work was commenced in October, 1924, and on December 24th the first three consumers were connected to the system. At the end of August, 1925, about 60 consumers had been connected up, and 13 electric cookers and various motors for pumping and general purposes installed. Of these consumers, seven had private installations, which have been entirely replaced by the company's supply. Under its agreement with the Norwich Corporation, the company receives three-phase current, at 6,000 volts, 50 cycles, in a transformer house situated in the centre of the village. At this point it is transformed down to 400 volts for power, and 220 volts for lighting.

The main cables from Norwich are laid underground, but distribution throughout the village is effected by overhead bare copper wire, carried on poles as shown in fig. 1. After transformation, the current passes to a main switchboard in the transformer house, where the supply is divided into two sections, one supplying the east side and one the west side. The capacity of the transformer is 50 kW, with a present maximum load approaching 36 kW. The overhead mains consist of 0.04 sq. in. bare copper phase wires with split neutral 0.0125 sq. in. The main line is about 1½ miles in length, along which all three phases are taken with single- and two-phase distributors over roads branching from the main, fig. 4. The straight-line pole fittings are well shown in fig. 2, the top cross arm carrying the split neutral, and the two lower arms the three phase wires, with a spare insulator for a switch wire in the event of street lighting being required, fig. 3, which undoubtedly will be the case in due course. This arrangement will permit street lighting to be controlled from the transformer station, where the energy can be separately metered, and it will avoid the expense of employing men for lighting and extinguishing lamps. Near each pole a guard wire encircles the live conductors, as can be seen in the illustrations. The main street in places was heavily wooded, and a great deal of tact and trouble was involved in pacifying frontage owners when obtaining permission for the very small amount of cutting away that was actually undertaken. The Post Office, as usual, being first-comers, occupied the clear runs with

Fig. 1.—Distribution Line.

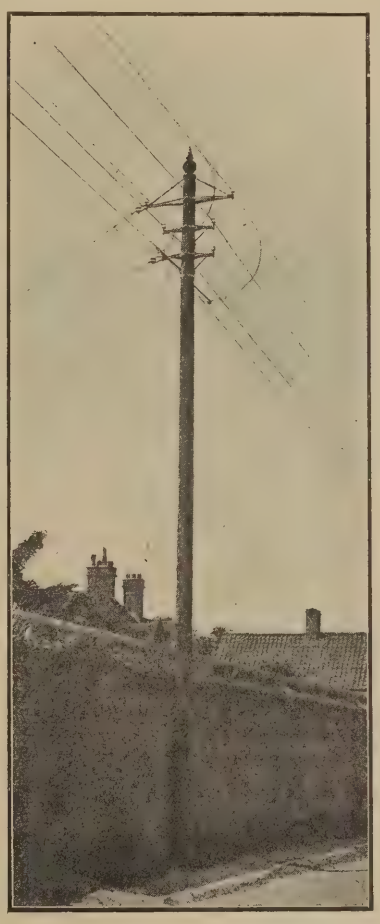

Fig. 2.—Straight-Line Pole Fittings.

Fig. 3.—Public Lighting Connection.

poles carrying 18 or more pairs of wires. Special guarding was undertaken to comply with the P.O. requirements, and in this respect fig. 5 shows clearly the "cage" erected, consisting of bare copper horizontal wires in line with the split neutrals. Below them the two sets are joined up at the sides and bottom by cross members. Some such arrangement, although probably entirely unnecessary from a safety point of view, is held to be compulsory, and the difficulty at once arises as to the possibility of the "cage" shorting the phase wires under the pressure of strong winds. To overcome this difficulty, special insulated stay pieces are connected in at proper intervals, between the phase wires and the guards, which have the effect of preventing the 'cage" swinging more than a few inches.

the gross rateable value, in addition to 1½d. per kWh wiring costs are simplified, only one meter is required, and the final cost per kWh becomes more favourable as the consumption increases. The carrying-out of this installation throws an interesting light on the difficulties to be overcome in supplying such rural areas. The pious hope expressed by various Ministers, that schemes of this kind would be helped and encouraged in every possible way, is not borne out in actual practice. Nearly every frontage owner discovers that his trees are exceedingly valuable, and a blank refusal to allow them to be trimmed is generally followed by permission, subject to payment. The payment for wayleaves is a very serious item in a small distribution system, and it would appear quite time that a definite decision should be

Fig. 4.—Branch Line.

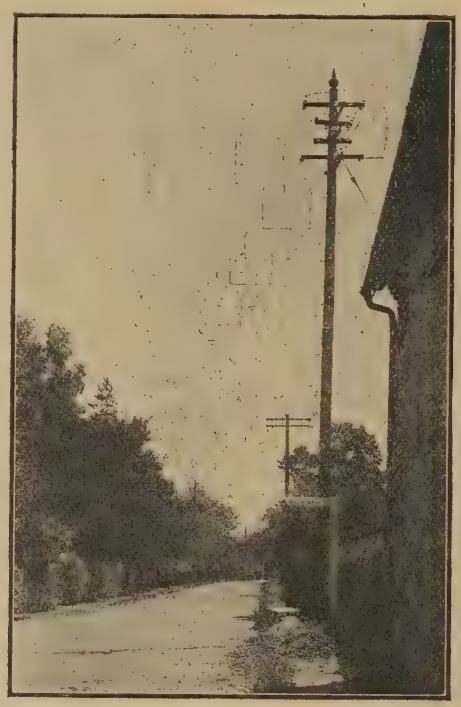

Fig. 5. - Special Guarding Arrangements.

Fig. 6.—Supply Service.

Fig. 6 shows the arrangement for the three-phase supply to the Brundall pumping station. Consumers' services are also carried overhead, being jointed in the copper bridges with special mechanical connectors; either bare or "P.B.J." wires are employed, according to the position. In certain cases, as shown in fig. 1, the split neutral has been bridged across the top where the supply wires run under the G.P.O. conductors. As it is the company's intention to encourage the use of electrical energy for purposes other than lighting, the "Norwich" method of charging has been adopted, and the terms are 25 per cent. on

obtained as to the actual rights of frontage owners who have trees growing within their boundary, but the branches of which overhang the highway from 3 to 12 or 15 ft. Such difficulties would not arise with underground mains, but the capital cost would at once increase the price of energy, and every service from an underground cable would cost at least four times the amount for a similar overhead service. The contractors for the whole of the overhead work, transformer house, switchboard, &c., were Messrs. W. T. Henley's Telegraph Works Co., Ltd., London, and the consulting engineer was Mr. G. T. Redgment, of Norwich.

The Electro-Osmotic Softening of Water.

A Method of Purification Much Cheaper than Distillation.

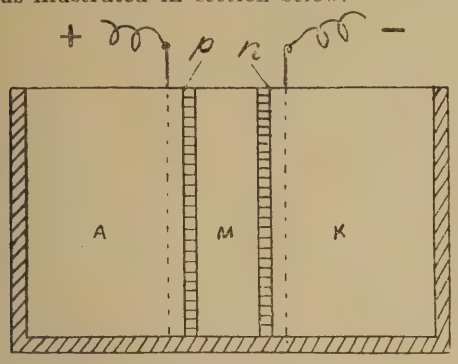
By W. G. RUMBOLD.

In *Elektrotechnik u Maschinenbau* of October 18th, Dr. Erwin Mayer contributes an interesting article on the above subject.

The following is an abridged translation of the article, which states in a simple manner the method of obtaining either practically pure water comparable to distilled water, or a soft water of a less degree of purity by means of the electro-osmostic method.

It is a fact long known that salts which are electrolytes dissolved in water are dissociated into positively and negatively charged ions known as cations and anions. The metals and hydrogen form cations and the acid radicles the anions. This property of electrolytes was first suggested by Arrhenius, and is now generally accepted as the true explanation of certain phenomena associated with the behaviour of these salts in water.

Under the influence of the electric current, as in electrolysis, the anions are attracted to the anode and the cations to the cathode.



Taking a water which is hard, due to the presence of calcium sulphate in solution, the action of the electric current is that indicated in the following equation :—

$$CaSO_4 \underset{\longleftarrow}{\overset{\longrightarrow}{}} \overset{++}{Ca} + \overset{--}{SO_4}$$

The Ca ion is attracted to the cathode and the SO_4 ion to the anode. In consequence of secondary action, the Ca is converted into calcium hydroxide and the SO_4 to

sulphuric acid according to the equation: $Ca + 2HOH = Ca(OH)_2 + H_2$ and $SO_4 + HOH = SO_4H_2 + O$. Other salts usually found in natural waters behave similarly.

Under the influence of the electric current, the decomposition products are not removed, but remain in the water. In order, therefore, to obtain a pure water, these decomposition products must be eliminated. This can be successfully accomplished by separating the electrodes by suitable diaphragms which will permit the passage of the ions, but not that of the water molecules. This can be carried out in a so-called three-cell apparatus illustrated in section below.

Three-cell Apparatus.

The middle space M contains the water to be purified, and this is separated by two diaphragms *n* and *p* from the electrode spaces A and K. As explained above, the ions are attracted to the respective electrodes, with the result that the water in M gradually loses the dissolved salts by the passage of the ions through the diaphragms to the electrodes, becoming first softened, but in course of time entirely freed from dissolved salts. It is obvious that the degree of purification is a matter of choice, and depends upon the duration of the passage of the electric current. It is further obvious that this method of purifying water is an alternative to distillation.

With a single three-cell apparatus the purification process is an intermittent one. In practice, however, it is usual to make it continuous by using a series of these, usually ten, arranged very much like a filter press. The water to be purified is introduced into the middle space of the first of the series and by an automatic arrangement is conveyed to the corresponding space in the second, and so on through the series until it leaves the last either in a completely purified condition, or at the degree of purity it is desired to reach. The electric pressure is regulated for each one, being least in the first, and being gradually increased up to the end. This regulation depends upon the fact that resistance to the current increases as the salts are removed from the middle space.

The expenditure of energy for purification is governed on the one hand by the degree of hardness of the water and on the other by the degree of purification sought. For complete purification of a Vienna water of 10 degrees of hardness, about 1.8 kWh is necessary per hectolitre (22 gals.), while for a water of 20 degrees of hardness about 2.5 kWh is necessary. Treatment down to 2 to 3 degrees of hardness would require from 0.4 to 1.2 kWh for waters with an original hardness of from 10 to 25 degrees.

In all cases the production of pure water by the process is cheaper than distillation. The author states that under ordinary conditions the cost is about one-fifth that of distillation by coal fuel, or one-tenth when gas is used as the fuel.

In comparing the cost of softening boiler water by the electro-osmotic process with the chemical methods used for the purpose, the cost of electricity is the deciding factor, but the electro-osmotic process can be successfully used in the cases of certain waters which cannot be softened successfully by any other known method.

The process works practically automatically, requiring the minimum of attention. It can be advantageously worked during the night when the rate for energy is lower.

The extensive development of hydro-electric power in Austria has made it desirable to widen the basis of power application, and for this reason alone, the introduction of the electro-osmotic method of water softening is welcomed as furnishing a new use for electricity, if only in a subordinate degree.

Notes on Induction Motors.

The Influence of Connections on the Resultant Magnetic Field.

By S. W. SWANN, B.Sc. (Eng.)

The following notes on the influence of the connections of the windings on the resultant magnetic field in a three-phase induction motor may be of some interest. Three cases arise, *viz.*:—

(*a*) Any two phases interchanged.
(*b*) One phase reversed.
(*c*) One phase omitted.

Case (*a*).—The effect of this is to reverse the direction of rotation of the resultant magnetic field without altering its magnitude. This is a well-known result, and may easily be demonstrated by resolving the three alternating magnetic fields into their equivalent rotating components, paying due attention to the various phase relationships.

Case (*b*).—The vector diagram of the magnetic fields for this case is shown in fig. 1, where phase three has been reversed. Assuming the sequence of phases to be 1, 2, 3, the disposition of the various equivalent rotating fields at the instant when the current in phase 1 is a maximum is as indicated in fig. 1, where the rotating fields 1 and 2 are equivalent to the alternating field of phase 1; 3 and 4 refer to phase 2, and 5 and 6 to phase 3. We see that the rotating components 1 and 6 continually neutralise one another. If ϕ_m denote the maximum flux due to each alternating field, then components 2, 5, and 3 unite to form a single rotating field of magnitude ϕ_m and coincident with component 5 at the instant under consideration. The resultant magnetic field is therefore as indicated by

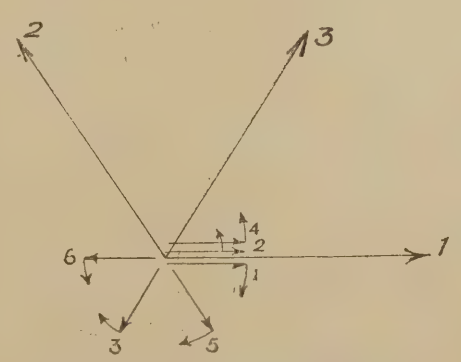


Fig. 1.—Vector Diagram of Magnetic Fields.

the vector diagram of fig. 2. Obviously, the two components coincide in direction along the dotted line OX. It is most convenient to decompose the rotating vectors into components along the rectangular axes OX, OY,

taking the zero of time at the instant when both vectors lie along ox. We therefore have —

$$x_1 = \tfrac{1}{2}\phi_m \cos\omega t,\quad y_1 = \tfrac{1}{2}\phi_m \sin\omega t,$$
$$\text{and } x_2 = \phi_m \cos\omega t,\quad y_2 = -\phi_m \sin\omega t,$$

paying attention to the opposite angular velocities, the suffixes 1 and 2 referring to the vectors $\phi_m/2$ and ϕ_m respectively. Combining these results we have—

$$x = x_1 + x_2 = 3/2 \cdot \phi_m \cos\omega t$$
$$\text{and } y = y_1 + y_2 = -\tfrac{1}{2}\phi_m \sin\omega t$$

for the rectangular components along ox and oy of the resultant magnetic field at any instant. From this we obtain— $x^2/(3/2 \cdot \phi_m)^2 + y^2/(\tfrac{1}{2}\phi_m)^2 = 1$.

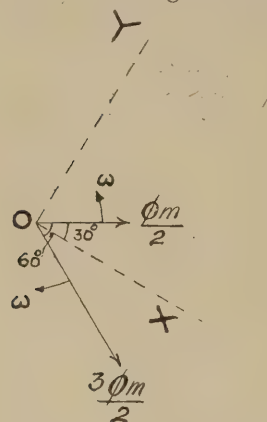

Fig. 2.—Vector Diagram of Resultant Magnetic Field.

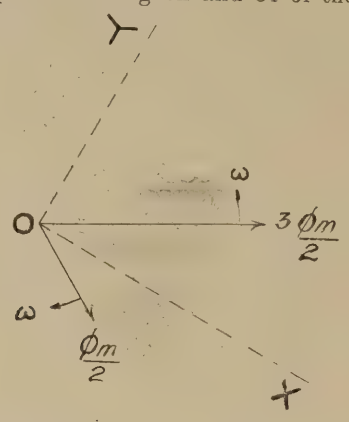

Fig. 3.—Rotating Vectors.

Therefore, the locus of the extremity of the vector of resultant instantaneous flux is an ellipse whose axes lie along ox and oy. The orientation of these axes is symmetrical with respect to the vectors 1, 2, and 3 in fig. 1.

In this case, therefore, the field is not constant in magnitude, but varies from $\phi_m/2$ to $3\phi_m/2$.

Case (*c*).—Supposing phase 3 to be open-circuited, it is easily seen that the system of rotating vectors is as shown in fig. 3. This is the same as fig. 2, except that the vectors ϕ_m and $\phi_m/2$ are interchanged. The detailed investigation of this case may be made in the same manner as for case (*b*). It will be found that the locus is the same, *i.e.*, an ellipse of semi-axes $\phi_m/2$ and $3\phi_m/2$. Also, at any instant, reckoning the epoch zero when both vectors lie along ox, the resultant flux vector is of the same magnitude in each case, but not in the same direction. In fact, the inclinations to ox of the vectors of resultant flux are given by—

$$\tan\omega t = -3\tan\theta \text{ (case (}b\text{))},$$
$$\tan\omega t = 3\tan\theta^1 \text{ (case (}c\text{))},$$

so that the angles θ, θ^1 are equal and opposite in sign. Of course, this is due to the fact that the vector of resultant flux rotates in opposite directions in the two cases, the direction of rotation being the same as that of the predominant rotating component in each case.

The torque produced under the circumstances of cases (*b*) and (*c*) is naturally irregular, and a characteristic pulsating sound issues from the motor.

Electrical Power Development.

A Review of the Electricity Supply Industry in Great Britain.*

STUDENTS of human progress have long recognised that the enthusiasm of the few is far more potent in effecting changes than the needs of the many. The vague desires of the multitude for betterment have to be concentrated on some definite scheme which promises an increase in wealth or comfort, and not until this has been done can the inertia of the mass opposing change appear as an irresistible force to bring it about. The public in this country, and the politicians who represent them, have at length been aroused to some appreciation of the advantages which would ensue from a more energetic development of electricity supply, and the appointment of the Electricity Commission after the war was an outward and visible sign of awakened interest. The enthusiasts have so far succeeded in converting the nation that every political party now places electrical development in the programme, and no public speaker would dare to depict a millennium in which electricity did not flow in the land like milk and honey.

This state of affairs, gratifying as it may appear to those who have laboured for the recognition of electricity as one of the essential factors of modern civilisation, is by no means free from danger. The mantle of prophecy has descended from the shoulders of the instructed few to those of the uninstructed many. The labourers of the eleventh hour are tempted to make up for their earlier aloofness by exuberant manifestations of energy, promising an immediate crop of impossible fruits if only they are allowed to manage the garden their own way. Now that public interest in electrical development is definitely aroused, it is more than ever important that public opinion should be correctly informed. A good case is merely weakened by exaggeration, and the best object in the world may be frustrated by trying to obtain it in the wrong way. It is only by propaganda that public opinion can be directed, and all who hope for the national benefits from a cheap and abundant supply of electricity are in duty bound to see that the economic effects to be expected are accurately stated and that political ideals are kept distinct from questions of engineering.

That the propaganda in favour of electricity in general has brought about a most welcome change in public outlook is undeniable, and we would not like to see it diminished. Hence the appearance of a book dealing with the national aspects of power development, written in such a way as to appeal to the educated layman, is to be regarded with pleasure.* The author, Mr. Hugh Quigley, has collected many of his contributions during the past few years to the technical and lay Press, and expanded them into a well-written and interesting volume of over 150 pages. A foreword by Mr. D. N. Dunlop, Director of the B.E.A.M.A., expresses the view that "Electricity is one of the fundamentals which will modify in the near future our whole industrial complex," and suggests that the book should be considered from this point of view. This, indeed, appears to be the underlying idea of the author, who shows by numerous diagrams and statistics what has been accomplished so far towards bringing nearer the state of affairs which he desires.

The book is extraordinarily free from any taint of political prejudice. Credit is given fairly to both municipalities and power companies in the main industrial areas for "having co-operated in advancing the cause of electricity through reasonable rates and effective service," and nowhere in the book is a partisan spirit observable. Controversial points, however, are to be found in plenty. The policy of interconnection, for example, is strongly advocated, though the author, like all other supporters of this policy, fails to show exactly how the presumed improvement of load factor is to be brought about by it. The inhabitants of every town in England have much the same hours of work and sleep. They all want power and heat during the day, light during the evening, and very little electrical energy of any kind from midnight till morning. The

*"Electrical Power and National Progress," by Hugh Quigley; with a foreword by D. N. Dunlop. Pp. 160; 18 figs. London: George Allen & Unwin, Ltd. Price 8s. 6d. net.

aggregate load factor of a number of towns is therefore substantially the same as the load factor of any one of them, and there is nothing to be gained by interconnection, except possibly a greater security of supply and a reduction of stand-by plant. The latter benefits are quite enough to justify the interconnection of near-by stations, but the idea of materially improving load factor or cheapening electricity by general interconnection on a national scale appears to be a pure myth.

More than once the author shows a certain want of appreciation of technical considerations. It is true that his statement that "the place for the electric power station . . . is in the heart of the coal-field" is somewhat negatived by a warning later in the book that "in this country the insistent advocacy of pit-head stations using coal at the place of extraction has tended to divert attention from the realities of the case." With the latter sentence we cordially agree. If the people who so glibly advocate pit-head stations could be got to understand that for every ton of coal burned in the furnaces six hundred tons of water at least has to be pumped through the condensers, less nonsense would be talked on the subject. Coal can be, and is, transported cheaply to any spot in the country, whereas water, in the immense quantities required by a modern power station, is only available in the places where Nature has provided it. In this connection it is not at all clear what Mr. Quigley means by his statement that "there is no water supply available in this country to provide condenser cooling water . . . for stations above 200,000 kilowatts, and it is extremely doubtful whether an average of 80,000 kilowatts can be exceeded even under the most intensive electrification." Why an island, of which no point is more than 50 miles or so from a sea or ocean, should be short of condensing water is unexplained, nor does the author tell us how the Gennevilliers station at Paris will manage to deal with 340,000 kilowatts, if we cannot exceed 200,000 kW in this country.

"The progress of supply in Paris since the conclusion of the war," he states, deserves careful examination, "since it supplies a clue to the immense improvement in the industrial and economic prosperity of France." This, of course, is special pleading of the worst kind. It would be equally true and equally false to state that the reorganisation of the Paris electricity supply has prevented France from paying her allies for money lent, has reduced the franc to the value of two-pence, and has brought the country to a financial crisis of extreme seriousness. If this is industrial and economic prosperity, France, we think, would be better off with a little less prosperity. The cause of electrical development is not served by statements which are obviously absurb.

One does not like to criticise the arguments in a book with the objects of which every sensible man is in agreement, but central-station engineers will be a little surprised to learn that "A motor working on a power factor of 0.8 is working out of phase . . . with the result that a high percentage of the total power sent out from the station has no earning value." This sentence might perhaps be passed as a loose mode of expression, were it not amplified by an illustration which shows a curious idea concerning the effect of bad power factor. It is stated (with reference to a 100,000-volt overhead line, 132 km. long) that "at 0.9 power factor 84,000 kilowatts can be transmitted to Berlin, while phase adjustment up to unity power factor increases this to 127,000 kilowatts." This point is elaborated by calculations to show that a 90 per cent. power factor increases the selling price of electricity by 50 per cent., and then we read: "the Berlin investigation illustrates on a large scale what is taking place in every part of Britain through low power factor; the capital and maintenance costs of transmission are at least 50 per cent. more than they should be with a proper system of supply at unity power factor." Most engineers, we think, would be glad enough to get even a 90 per cent. power factor on their feeders, and if this involves a 50 per cent. loss we wonder what the author would calculate the losses to be on a certain Continental system we recently inspected where the power factor was usually between 60 and 65 per cent.

In dealing with electrical development in Great Britain, the author has drawn largely on the valuable statistics published this year by the Electricity Commission, and by a judicious selection has brought into prominence many points of interest. Why, for example, have the costs of the generating plants of six large power companies ranged from £38.6 per kW installed, in the case of the South Wales Power Co., to £15.5 in the case of the Clyde Valley Co.? Turning to London, the municipal plants of Stepney and West Ham cost £17.1 and £19.1 per kW installed respectively, whereas the Charing Cross Co.'s plant cost £27.5 and that of the City of London Co. as much as £34.9 per kW installed. As regards the price of electricity, the variations are even more striking. The average price obtained by the Newcastle Electric Power Co. in 1923-24 was only 0.74d. per unit, and the Clyde Valley, Lancashire, Yorkshire and Mersey Companies all sold at an average price of less than a penny. In the London area the average consumer on the County of London Co.'s system has to pay no less than 3.93d. per unit, while his neighbour, who is supplied by the borough of Stepney, only pays 1.48d. on the average. Recent correspondence in *The Times* has shown the dissatisfaction which is rightly felt as regards the prices charged by the London companies, and it is to be hoped that the effect of the recently-formed Joint Electricity Authority will be to bring about a more equitable state of affairs. Whatever views one may hold about municipal trading, it is undeniable that some of the London boroughs have set an example in economical generation and cheapness of supply which the large companies would do well to emulate.

In conclusion, one would like to suggest to the author and to all other propagandists in favour of electricity that much industrial load might be obtained by a more detailed treatment of typical cases than seems ever to be given. If the advocates of main-line electrification, for example, would analyse the traffic between, say, London and Birmingham, showing what it costs now in capital charges, labour, fuel, and maintenance, and then give a corresponding estimate under electrified conditions, they would do much more to further their cause than by pointing out the progress of railway electrification in countries with no coal mines. Similarly in manufacturing questions: what, for example, is the actual cost of power per yard of calico in a steam-driven weaving shed, both actual, and in relation to total costs, and what would be the effect on the latter of reducing the power costs by purchasing electrical power? The case for electrification of all factories in which power is a significant item in the total manufacturing costs is unanswerable, but the benefit must be expressed in shillings and pence if conviction is to be brought home to the manufacturers.

Scholarships in Engineering.—The Council of the British Electrical and Allied Manufacturers' Association (Inc.) has recently granted the following scholarships, tenable for one year, each of the value of £100, together with the payment of college fees:—In Electrical Engineering: John Greenville Jackson, tenable at Faraday House; Felix Samuel Naylor, tenable at City and Guilds (Engineering) College, South Kensington; Frederick James Pepworth, tenable at the College of Technology, Manchester; William Raymond Shepherd, tenable at the College of Technology, Manchester. In Mechanical Engineering: John Stanley Clark, tenable at Birmingham University. In Electrical and Mechanical Engineering: Edward Norman King, tenable at Armstrong College, Durham University. The following scholarships have been renewed:—John Tempest Birtwell, tenable at the College of Technology, Manchester; John Charles Burke, tenable at the College of Technology, Manchester; Arthur Bernard Everest, B.Sc., tenable at Birmingham University; George Emil Gregson Foden, tenable at the Victoria University, Manchester; Isaac Herdman Hedley, tenable at Armstrong College, Durham University; Percy James Maggs, tenable at the City and Guilds (Engineering) College, South Kensington; Harold Giles Richards, tenable at the City and Guilds (Engineering) College, South Kensington.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

E.D.A. Activities.—In our article upon "Electrical Gifts for Christmas," which appears elsewhere in this issue, we mention the aid which the British Electrical Development Association proffers retailers of electrical goods. We have received specimens of the literature which the Association has prepared for the season. One sheet reproduces pictorial advertisements, electros of which can be purchased. These leave ample space for local matter and are very effective. A number of booklets are also available: one, entitled "Christmas Presents," sets forth the arguments for electrical gifts in a very attractive manner.

Employment during October.—The monthly review of employment conditions in the *Ministry of Labour Gazette* states that employment in the engineering trades during October continued bad on the whole, but showed a slight improvement except in the marine engineering section which experienced a marked decline. Employment in the electrical branch was fairly good. The general unemployment figure for the engineering industry was 11.3 per cent., a decrease of 0.2 per cent. In the marine section it was 25.5 per cent., while the electrical branch made the best showing with 5.5 per cent., an increase of 0.2 per cent. There were slight improvements during October in the electrical wiring and contracting, and electrical cable, wire and lamp manufacturing industries.

Unemployment.—The total number of registered unemployed persons on November 16th was 1,196,200, representing a decrease of 1,926 during the week and 12,799 during the past year.

Commercial Electrical Travellers.—The Electrical Trades Commercial Travellers' Association held a successful whist drive and social at Manchester Hotel, Aldersgate Street, on November 21st. The attendance was disappointing, only about 80 members and friends being present, although some 300 invitations were issued. Despite this slight set-back, a very enjoyable time was spent, and the prizes, which were presented to the winners by Mrs. Joyce, wife of the chairman of the Association, were really handsome. The evening was concluded with an excellent musical entertainment provided by Miss Beale and Mr. Bidwell (vocalists), and Mr. Boxall and Mr. Montague (entertainers). The entertainment secretaries and others who were responsible for the programme are to be congratulated upon the arrangements made; their efforts were deserving of much better support.

The British Industries Fair.—The Department of Overseas Trade announces that Canada and East Africa have notified their intention of participating in next February's Fair. Special sections are being organised in London to display Canadian and East African products.

The Shannon Scheme Dispute.—It is reported that the Irish Labour Party and Trade Union Congress have "blacklisted" the Shannon hydro-electric scheme, *i.e.*, they have called upon their members not to take employment under the contractors, the Siemens-Schuckertwerke. The position is that the firm offers labourers 32s. per week, whereas the unions demand 1s. 1d. per hour.

A "Siluminite" Blotter.—THE SILUMINITE INSULATOR CO., LTD., has sent us a blotter (of the rocking type) the parts of which are made of its insulating materials.

Local Exhibition.—BLACKPOOL.—Organised by the Corporation Electricity Supply Department, an electrical exhibition was opened at the Winter Gardens, Blackpool, on November 18th, and will remain open until December 12th. The Department has over 300 cookers on hire and is confident that as a result of the exhibition this number will be greatly augmented. Recently an "all in" tariff for the supply of current for domestic purposes, was introduced whereby a fixed charge of 12½ per cent. per annum on the net assessment for rateable value purposes, is paid quarterly, in addition to a charge of 1d. per unit for the current consumed. The principal exhibitors are:—The General Electric Co., Ltd., "Magnet" electrical appliances, including ovens, restaurant grillers and fryers, irons, cookers, toasters, hot plates, pedestal heaters and radiator fires, washing machines, &c.; Messrs. J. W. Fielding & Co., Blackpool, shop and house fittings, electric fires, vacuum cleaners, &c.; Messrs. R. Darbyshire, Ltd., Blackpool, the "Lightfoot" tubular electric heating system, "Exide" batteries, "Crypto" motors, "Hoover" vacuum cleaners, &c.; Mr. George Morrison, Blackpool, heating and cooking apparatus; and Messrs. Jones Bros., Blackpool, numerous applications of electricity in the home and workshop.

Maintaining Supplies during an Emergency.—In order to protect the public in the event of an industrial dispute which may result in the cutting off of supplies of essential commodities, the Government has organised a skeleton system to ensure that all such essentials shall reach the public. The arrangements include means of maintaining coal supplies, and regulations will be made whereby local authorities may place restrictions upon the consumption of gas and electricity in their areas.

Patent Application.—Application has been made for the restoration of Patent No. 174,744 of 1920, granted to Miles Walker for "An electric harmonic analyser."

Parliamentary Notices.—A number of applications whic are being made to Parliament for electrical powers appear i the *London Gazette* for November 20th and following issues We shall refer to the applications in the usual form when th collection is complete.

Trade Announcements.—MESSRS. SUPERADIO, LTD., of Pau Street, E.C.2, ask us to state that they have no connectio with Super Radio Co., the defendants in the action referred t on page 840 of our last issue.

THE ELECTRICAL SUPPLIES (LIVERPOOL), LTD., ask us to state in order to put an end to certain confusion that exists, tha they are not connected with the E.S. Company, Ltd., of Lon don and Machester, now in liquidation, or with any other busi ness trading under a name similar to their own.

MR. F. P. FRY, electrical engineer, of Newport, Isle of Wight has removed his business to larger premises at 80, Pyle Street

THE CURTIS MANUFACTURING CO., LTD., Paddington, W.2 informs us that it has no connection whatever with Pete Curtis, Ltd., a company which is mentioned under "Privat Arrangements" in this issue.

Catalogues and Lists.—THE BENJAMIN ELECTRIC, LTD. Brantwood Works, Tariff Road, Tottenham, N.17.—The "Benjamin Reflector," containing notes on poster lighting, office and shop-lighting equipment, automobile accessories, &c.

MESSRS. NEGRETTI & ZAMBRA, 38, Holborn Viaduct, E.C.1.—Lists Nos. C6 and C9, containing particulars and prices o various forms of distance thermometers.

RADIO INSTRUMENTS, LTD., 12, Hyde Street, New Oxford Street, W.C.1.—A descriptive pamphlet dealing with the company's new h.f. reactive anode unit.

METROPOLITAN-VICKERS ELECTRICAL CO., LTD., Trafford Park Manchester.—A series of new and revised leaflets dealing with the company's productions, including switch- and fuse-gear, motors and motor-controlling equipment, arc-welding plant, &c.

METRO-VICK SUPPLIES, LTD., Trafford Park, Manchester.—An electrical fittings catalogue (244 pp.), beautifully illustrated by the photogravure process. The fittings include bowls, brackets, lanterns, electroliers, and many other kinds of electric lighting equipment. Fully priced.

MR. HARRY MOSS, 82, Leeds Road, Bradford.—Pamphlets advertising "Kohler" lighting sets, "Benjamin" reflectors, and "Whitecap" washing machines.

MESSRS. A. V. WILLMOTT, SON & PHILLIPS, St. John's House, Minories, E.1.—A number of pamphlets dealing with "Formica" insulating material and laminated bakelite products, with price list.

ELECTRICAL UTILITIES, LTD., Tudor Works, Park Royal, N.W.10.—Leaflet H.C./2, containing illustrated particulars of "Utility" electrical heating and cooking apparatus. Priced.

MESSRS. L. G. HAWKINS & CO., LTD., 30-35, Drury Lane, W.C.2.—Two illustrated pamphlets dealing with the "Silverlite" all-metal reflector.

BIRKBYS, Liversedge, Yorks.—A mailing card advertising "Elo" synthetic resin insulation.

THE HOTPOINT ELECTRIC APPLIANCE CO., LTD., 24, Newman Street, Oxford Street, W.1.—A price list of "Hotpoint" electrical appliances and a folder illustrating the company's electric irons.

THE BRIGHTON LIGHTING & ENGINEERING CO., LTD., St. Martin's Place, Lewes Road, Brighton.—An illustrated leaflet describing a new "Tell-tale" switch-fuse unit.

AUTOMATIC & ELECTRIC FURNACES, LTD., 173-175, Farringdon Road, E.C.1.—An illustrated catalogue of "Wild-Barfield" electromagnetic steel-hardening furnaces.

THE RICHARDS THREAD MILLING MACHINE CO. (1918), LTD., 222, Strand, W.C.2.—A priced pamphlet dealing with thread-milling machines for tube manufacturers, &c.

MESSRS. W. H. ALLEN & CO., LTD., Queen's Engineering Works, Bedford.—Catalogue No. 112a, describing the "Allen" heavy-fuel oil engine. Illustrated.

THE CARPAX CO., LTD., 312, Deansgate, Manchester.—Illustrated pamphlets advertising "Homcharger" battery-charging apparatus; "Sangamo" fixed condensers; and various forms of receiving sets and accessories. Priced.

THE ALTON BATTERY CO., LTD., Alton, Hants.—An illustrated leaflet describing the "Alton" battery installed at the Fenny Stratford telephone repeater station. Mention is made of other large contracts carried out by the company.

THE BRITISH THOMSON-HOUSTON CO., LTD., Mazda House, Newman Street, Oxford Street, W.1.—An illustrated folder dealing with "Keldon," "Ace" and "Trojan" lighting fittings, and a device advertising "Mazda" lamps.

MESSRS. T. HARDING CHURTON & CO., LTD., Atlas Works, Leeds.—Circular No. 620, describing the company's induction motors, with performance curves.

MESSRS. RANSOMES, SIMS & JEFFERIES, LTD., Ipswich.—Two priced catalogues, giving full particulars of the company's d.c. motors and dynamos, and induction motors respectively.

THE GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, W.C.2.—The November "Osram Bulletin," containing notes and articles on the manufacture, sale, and installation of "Osram" lamps and radio valves.

Bankruptcy Proceedings.—T. ROBERTS and J. TAYLOR, rading as Roberts & Co., electrical engineers, 61, Old Town Street, Plymouth, and Fore Street, East Looe. These debtors were to have attended for their public examination at the Plymouth Bankruptcy Court on November 20th. Only the latter put in an appearance, and he Official Receiver said he did not anticipate that Roberts would attend and he might have to make an application with egard to him later. TAYLOR stated that Roberts suggested a partnership, each of them to contribute £150 capital. The witness contributed his share, but Roberts did not do so and made various excuses right up to the time he left. The Plymouth business progressed very well for the first six months. Then they contracted to light the town of Looe with electricity, and opened a branch establishment there, to which debtor attended. Roberts supervised the business both at Looe and Plymouth. The Looe contract was undertaken within a month of their starting business at Plymouth. While debtor was at Looe, Roberts, without consulting him, bought for £1,300 on the instalment system, a plant for supplying ice to the fishing boats. That plant had never been used or even erected. They also started a power station, and laid the cable in certain parts of Looe, but the street lighting had not actually been carried out. They had supplied light to private customers. Taylor, after stating that his partner had absconded, said that he consulted his accountants and at a meeting of the creditors which was convened he made an offer of 12s. 6d. in the £, which was not accepted. Debtor said the intention was to turn the concern into a limited liability company. The statement of affairs showed liabilities for dividend amounting to £3,223. As regarded his own private affairs, the liabilities were £19, and he had no assets. The Registrar adjourned the examination until January 1st.

VERNON REED, 10, Chapel Road, Eastville, Bristol, electrical engineer.—The first meeting of creditors was held on November 18th, at the Official Receiver's Offices, Bristol. The statement of affairs showed liabilities of £334, against assets of £11, leaving a deficiency of £323. Debtor attributed his failure to illness, loss of stock through defalcations of a former employé, and loss through delay in laying cables. He commenced business in December, 1922, as an electrical engineer with £100 capital, his savings. The business was fairly successful for the first six months, when, following a serious illness, he was unable for about 12 months to attend to it. In order to carry on he engaged an assistant but the business gradually diminished. He had several contracts to install electric light in certain houses; he completed the wiring and drew all the monies due for the work done, but could not complete the contracts owing to the delay in the laying of the cable, which was only put in a month ago. He was then unable to complete the contracts owing to lack of capital, and arranged for them to be taken over by another electrician. He became aware of his position about 12 months ago. The case being a summary one, was left with the Official Receiver as trustee.

The following are creditors:—

	£		£
Cottrell, E.	45	Sloan & Co., Ltd.	74
Sutton & Bridgman, Ltd.	150	Devening, —.	35

JAMES WILSON, electrical engineer, 70, Ebrington Street, Plymouth.—A meeting of creditors was held on November 9th. The statement of affairs showed gross liabilities of £637 and assets estimated to produce £412. The Official Receiver said that debtor commenced business in 1919, without capital. In October, 1923, he executed a deed of assignment. A friend purchased from the trustee the stock-in-trade, fixtures and fittings. Debtor stated that trade was satisfactory between 1923 and 1924, but he then had a struggle against ill-health. He was aware of his financial position in the early part of this year, but continued trading in the hope that his health would improve and he could put matters right. The public examination was fixed for December 18th.

W. K. COXON and E. R. WEARE (Western Mfg. Co.), Nursill, Lydney, Glos.—Trustee, Mr. C. Latham, 78, New Oxford Street, W.C., appointed November 12th.

H. C. PERRY, building and electrical contractor, 206, Mount Pleasant, and Birchfield Road, Headley Cross, Redditch.—Trustee, Mr. T. Easton, Official Receiver, 191, Corporation Street, Birmingham, released November 11th.

R. EMMOTT, electrical appliance merchant and contractor, 1, Manor Street, Bradford.—Trustee, Mr. W. Durrance, Official Receiver, 12, Duke Street, Bradford, released November 11th.

F. H. P. HOOLAHAN (Holloway Bros.), electrical engineer and instrument maker, 16, The Hale, Highams Park, and 299, Holloway Road, N.—Last day for proofs for dividend December 2nd. Trustee, Mr. E. Parke, Official Receiver, Carey Street, W.C.

W. K. M. WILSON, electrician and wireless apparatus dealer, 1, Mount Street, Heanor, Derby.—Last day for proofs for dividend December 2nd. Trustee, Mr. L. A. West, Official Receiver, 4, Castle Place, Nottingham.

F. P. CRAWLEY (New Central Garage), electric, radio, and motor engineer, 30, Mincing Lane, Blackburn.—First and final dividend of 5s. 8d. in the £, payable at the offices of Mr. T. T. Eaves, 47, Mosley Street, Manchester.

Dissolutions of Partnerships.—BELL CRYSTAL CO., 108, Dale End, Birmingham.—R. Withers and C. Campbell have dissolved partnership. Mr. Withers will attend to debts and continue the business at the same address.

WYATT & MAYO, electrical engineers, 46, Laygate, South Shields.—Mr. N. W. Wyatt and Mr. J. Mayo have dissolved partnership. Mr. Mayo will attend to debts and continue the business under his own name.

TINGLE BROS., ironfounders, mechanical and electrical engineers, and gasfitters, Bilson Foundry, Cinderford.—Messrs. W. and A. E. Tingle have dissolved partnership.

H. VINCENT THOMAS & Co., mechanical and electrical engineers, 5, Richmond Terrace, Swansea.—Mr. L. V. Thomas and Mr. H. W. Vincent have dissolved partnership. Mr. Thomas will attend to debts.

Company Liquidations.—ARTHUR LANGHAM & SONS, LTD., merchants, Holborn Viaduct House, Holborn Viaduct, E.C.—The statutory first meetings of the creditors and shareholders of this company were held on November 17th at Carey Street, W.C., before Mr. J. Barwick Thompson, Official Receiver. The statement of affairs showed liabilities of £10,730, against assets of £91, leaving a deficiency of £10,642 as regarded the shareholders, the issued capital being £4. The chairman reported that the company was registered as a private company on December 28th, 1923, with a nominal capital of £10,000, and was formed to carry on business as general merchants, importers of articles of Continental manufacture, and exporters of British goods. No established business was acquired, but the real object was to deal in electrical goods, household utensils and radio components. Immediately after the formation of the company, Continental purchases amounting to about £30,000 were made. In May, 1924, the company arranged for the purchase of 10,000 radio headphones; the total purchase price was £4,375, and 14 bills of exchange were accepted in respect thereof. No goods were received and it was ascertained that the manufacturers had gone into bankruptcy and could not execute the order. The company thereupon demanded the return of the bills but without success; they appeared to have been negotiated on the Continent. The circumstances in which the bills had been negotiated required further investigation. The failure of the company was attributed to its inability to obtain delivery of goods from abroad, but contributory causes were insufficient working capital and the bill transactions, which placed the company in serious difficulties. In the opinion of the Official Receiver the failure was due also to lack of proper business methods, extravagant expenditure and mismanagement. The liquidation was left in the hands of the Official Receiver.

REGENT RADIOPHONE CO., LTD.—Winding up voluntarily. Meeting of creditors at the offices of the Liquidator, November 27th. Particulars of claims to be sent by December 31st, to the Liquidator, Mr. E. H. Palmer, Bentinck Buildings, Wheeler Gate, Nottingham.

PORTA RADIO, LTD.—A meeting of members is called for December 21st at 39, Lombard Street, E.C., to hear an account of the winding up from the Liquidator, Mr. M. A. Heyburn.

GENERAL WIRELESS CO., LTD.—A meeting of members is called for December 17th at 31, Budge Row, E.C., to hear an account of the winding up from the liquidator, Mr. R. C. W. Clarke.

DE MARTIS ACCUMULATORS, LTD.—A meeting of members is called for December 21st at Adelaide House, King William Street, E.C., to hear an account of the winding up from the liquidator, Mr. C. A. Firth.

BRITISH EMPIRE EXHIBITION (1924), INCORP.—Winding up voluntarily. Liquidators, the Rt. Hon. J. H. Thomas, M.P., Sir J. A. Cooper, and Sir A. F. Whitney, 4b, Frederick's Place, Old Jewry, E.C. Meeting of creditors was called for November 26th, at Winchester House, Old Broad Street, E.C.

Private Arrangements.—PETER CURTIS, LTD., 75a, Camden Road, N.W., manufacturing electrical and wireless engineers.—As briefly reported in our last issue, a meeting of creditors was held on November 16th. A statement of affairs as at October 31st was presented, which showed liabilities of £16,190; the Paragon Rubber Co., Ltd., after deduction of debenture charge, was a creditor for £9,871. The net assets were valued at £757, leaving a deficiency, subject to the costs of winding up, amounting to £15,433. The company was incorporated in October, 1923, for the purpose of manufacturing and selling radio apparatus. Certain assets were purchased for cash amounting to £75. The subscribed capital was £100. In October, 1924, the capital was increased to £4,000. One of the directors, Mr. Forbes, drew £5 per week, but that remuneration was increased to £1,000 per annum. As from July, 1925, Mr. Forbes had voluntarily reduced his remuneration to £750 per year. In January, 1925, Mr. Forbes sold to the company a new high-frequency amplifier for £750, and took shares in the company for that amount. The Paragon Rubber Co. became large creditors, and subsequently Mr. A. E. Blackwell was appointed a director of Peter Curtis, Ltd., in the capacity of advisory manager. A floating charge was given to the Paragon Rubber Co. for £5,000. The chairman said he had no reason to doubt that the debenture was in every way valid. Continuing, he said that for the two years up to October 31st, 1925, there had been a loss of something like £1,100. That loss was attributed largely to the fact that the directors had found a general difficulty in launching a new organisation and during the period 1924-25 the company was left with heavy stock which had to be sold at unremunerative prices. The advances made by the Paragon Rubber Co. amounted at one time to something like £14,000, but it was unwilling to take advantage of the debenture. A meeting of the larger creditors had been held previously and the statement of affairs had been

placed before them. The chairman said that the directors had reason to expect that the company could in the future be conducted without loss. Mr. Latham proposed that, subject to all goods ordered subsequent to October 10th being paid for in cash, the creditors should accept an offer of 4s. in the £ payable not later than December 15th. The resolution was carried.

The Brazilian Electrical Market.—The United States Assistant Trade Commissioner at Rio de Janeiro, reporting at the end of last month, stated that electrical equipment sales in Brazil had fallen off considerably, only financially strong houses being able to buy. The market for radio equipment was "dead" after an exceedingly good month. The Sao Paulo power shortage would show improvement shortly owing to half of the Rasgao works being completed and the other half nearly ready.

Illuminated Assembly Rooms.—The accompanying illustration depicts a good example of modern ballroom lighting which is installed in the Star and Garter Assembly Rooms, Putney Bridge. The main illumination is effected by a number of artistic electroliers, while it is augmented by brackets

The Star & Garter Assembly Rooms.

fixed at frequent intervals on the walls. "Osram" gasfilled lamps in tangerine-coloured shades are used throughout. Over the stage, seen in the background, is a searchlight projector which is equipped with a rotary disk containing colour screens. The installation was carried out by Messrs. Tillotson, Fulham.

Siemens-Schuckert in Uruguay.—Siemens-Schuckert, of Germany, has applied for articles of incorporation in Uruguay for the purpose of opening a branch house in Montevideo under the name of Compania Platense de Electricidad Siemens-Schuckert. This action is being taken to obtain a more favourable position in supplying the growing demand for electrical supplies and equipment in Uruguay and for greater convenience in submitting bids on the numerous public tenders called for by Government and private institutions.—*Commerce Reports.*

The United States Electrical Export Trade.—Mr. Julius Klein, director of the U.S. Bureau of Foreign and Domestic Commerce, in the course of a recent address said:—"The United States is to-day the largest exporter of electrical goods, and its position is not seriously threatened. Before the war Germany led the world and supplied almost half of the total shipped by the five leading electrical manufacturing countries. The astounding advancement in technique in that industry in the United States and the tremendous domestic demand for its output are undoubtedly the two explanations of the position attained in our exports of this type."

Electric Furnace Orders.—Orders for its furnaces have recently been received by Automatic & Electric Furnaces, Ltd., from the Isotta Fraschini Fabbrica Automobili, Milan; the S.A. Tronvay et Cauvin, Paris; the Hans Keise A.G., Berlin; the L.C.C. Tramways Dept.; Henry Lane (Australia), Ltd., Newcastle, N.S.W., and a number of other British and foreign concerns.

German Foreign Electrical Trade.—Exports of electrical goods from Germany during the first six months of 1925 totalled 142,500,000 marks, as compared with 259,200,000 marks for the entire year 1924 and 290,300,000 marks for 1913. From January to June, inclusive, 1925, imports of these manufactures into Germany reached 8,400,000 marks, as against 9,100,000 marks in 1924 and 12,800,000 marks in 1913.—*Commerce Reports.*

For Sale.—Mr. H. J. Shaw will offer by auction on December 1st, at 85, Newington Causeway, S.E., various trade stocks of electrical and wireless manufactured goods and material. Messrs. Fuller, Horsey, Sons & Cassell will sell by auction at Church Wharf, Chiswick, on December 2nd, electric motors, circuit breakers, switchgear, &c. (See our advertisement pages to-day.)

A Report upon the British West Indies.—Mr. J. H. Wilson Goode, Trade Commissioner for the British West Indies, &c., has furnished the Department of Overseas Trade with a report upon the economic and financial conditions in his area. (Stationery Office, 2s. net.) Mr. Goode mentions a number of public works contracts which have been awarded, including one in connection with the Hermitage reservoir and hydro-electric works (Jamaica) which was let to a British firm for £149,978. Tenders are shortly to be invited for the remainder of the work. In British Honduras it is intended to recondition the Belize electric light and ice plant at an approximate cost of £20,800. The imports of electrical goods into Barbados, British Guiana, Trinidad and Tobago, and Jamaica aggregated £56,039 in 1924, as compared with £71,53 in 1923. The bulk of this business (£44,832 in 1923 and £34,82 in 1924) was secured by the United States. Great Britain supplied goods to the value of £22,593 in 1923, and £16,04 in 1924. It is stated that American influence gained considerable ground during the war, and although in many important lines the United Kingdom has since recaptured its trade, the predominance of American productions over a period of years has left an enduring mark. In certain lines German competition is increasing, and electrical goods are specially mentioned. German travellers are commencing to canvass these markets, and it is probable that German activities in this direction will increase.

Trade Marks in Argentina.—*British Industries* (the official organ of the F.B.I.), calls attention to the importance of maintaining a close watch upon trade mark interests in Argentina. It states that registration should be applied for and secured before any attempt is made to export goods to that country, and special care should be taken to renew the registration every ten years. The applications published in the *Boletin Oficial* should be watched by the local agents to guard against the registration of infringing marks.

Swiss Tariff Increases.—The *Board of Trade Journal* for November 19th published a list of articles which are to be subject to increased import duties upon entering Switzerland. Some duties are to come into force upon a date to be fixed, while others will probably be only used as instruments for obtaining concessions from other countries. The list includes the following items:—Insulated lead-sheathed cables; dynamo electric machines and transformers; automobiles, including electric cars; accumulators and plates; electrical measuring instruments; and telegraphic and telephonic apparatus.

Radio in Canada and the United States.—We have received a copy of a report prepared by Mr. W. A. Brooke, sales director of the Ashley Wireless Telephone Co., after a tour of Canada and the United States. Mr. Ashley says that an approximate analysis of radio apparatus used in Canada shows that it is about 90 per cent. American, Great Britain merely sharing in the balance. There is a preference for British goods provided that the price is reasonably competitive, and good sales of the Ashley Company's products were effected against American and Canadian competition. Canadians appear to depend mainly upon American broadcast

British Radio Apparatus at Montreal.

ing for their entertainment; the Dominion stations do not operate regularly. Both American and Canadian broadcasting is inferior in quality of transmission and standard of programme to British broadcasting. There is still no sign of "saturation" of the American radio market. All the factories visited were working at full pressure, producing an astounding quantity of apparatus. American radio components of the better class are superior to the average comparable British product; this is attributed to the opportunities for mass production. The accompanying illustration shows a stand arranged by the Ashley Wireless Telephone Co. at a Montreal radio exhibition.

Spanish-German Agreement.—The "tariff war" between Spain and Germany, which was expected to be of benefit to traders of other countries, has been brought to a swift end by the signing of a *modus vivendi* for six months.

Argentina's Electrical Imports.—During the first half of he current year the tariff value of electrical goods imported nto Argentina was 324,828,212 gold pesos, as compared with 78,743,353 pesos in the first six months of 1924.

Book Notices.—"Hütte, des Ingenieurs Taschenbuch." Edited by the Akademischen Verein Hütte, E.V., 25th edition, Vol. I. Pp. xvi+1,080; illustrated. Berlin: Wilhelm Ernst nd Sohn. Price 13.20 Rmk.—This publication, originally issued n 1857, has been brought up to date, and contains many new ections. Its contents embrace mathematics, technical physics, roperties of materials, measurements, surveying, &c.; in his volume only casual references to electrical matters occur, ut there is a vast amount of general information on engineer-ng subjects, with numerous tables and diagrams. There are hree other volumes in the series, which constitutes in con-ensed form an encyclopædia of engineering. The volume is learly printed in Roman type, with excellent illustrations, and s provided with a very full index.

"*Journal* of the Institution of Electrical Engineers." Vol. LXIII. No. 347. November, 1925, and Index to Vol. LXIII. London: E. & F. N. Spon, Ltd. Price 10s. 6d.

"*Journal* of the American Institute of Electrical Engineers." Vol. XLIV. No. 11. November, 1925. New York: The Insti-ute. Price $1.

"Electrical Power and National Progress," by H. Quigley. Pp. xii+160; figs. 18. London: G. Allen & Unwin, Ltd. Price 8s. 6d. net.

"Electrical Engineering Problems." Part 1. "Direct Cur-ent Circuits and Apparatus," by J. G. Pertsch, jun. Pp. iii+213; figs. 100. London: McGraw-Hill Publishing Co., Ltd. Price 10s.

"Elementary Electrical Technology," by A. M. Parkinson. Pp. x+179; figs. 130. London: Oxford University Press. Price 6s.

"Artificial Sunlight," 2; Special Report of the Public Health Department of the Metropolitan Borough of Poplar. October, 1925.—This publication is issued as a supplement to the pecial report of the Department, August, 1925, "Practical rtificial Light Treatment." It contains a description of the U-V-Scope," a simple portable photometer for gauging the ntensity of ultra-violet rays.

"Technologic Papers of the U.S.A. Bureau of Standards."—Vol. 19, No. 290, July, 1925 (30 cents); No. 295, August, 1925 10 cents).

"Scientific Papers of the Bureau of Standards," Vol. 20, No. 511, August, 1925. Price, 15 cents.

"High Vacuum Surface Condensers," by D. T. McHutchi-on. The Technical Section, Association of Engineering and hipbuilding Draughtsmen. Price 2s.—The factors affecting he rate of heat transmission in a surface condenser are fully iscussed and supported by curves. Many diagrammatic lustrations are given.

"The Dynamical Theory of Gases," by J. H. Jeans. Fourth dition. Pp. iv+444; 28 figs. London: Cambridge University ress. Price 30s. net.

Illumination Design Courses.—The ninth illumination esign course arranged by the Electric Lamp Manufacturers' ssociation was held at the North-East Coast Lighting Service ureau, Newcastle-on-Tyne, from November 23rd to 25th. The enth took place at the Scottish Bureau, Glasgow, from ovember 24th to 26th. The programmes of the courses were ractically identical, covering the lighting of shops, factories, treets, the home, &c., both from the technical and commer-ial aspects. The Glasgow Bureau reports that between seven nd eight hundred people have already attended lectures and emonstrations there.

At the London Bureau (Savoy Street) lectures have this onth been given by members of the staff to meetings of local hambers of Commerce, the Institution of Electrical Engineers, he National Association of Supervising Electricians, the Elec-rical Wholesalers' Federation, and other bodies.

Trade Opportunities in Spain.—The British Chamber of ommerce for Spain has informed *The Times* that in view of he difficulties imposed by Germany on imports of fruit from pain, commercial relations between these countries have been roken off. Spain as a result has totally prohibited imports f German goods into the Canaries and her North African orts, while imports into the Peninsula and the Balearic Isles re to pay duties under the first column of the Spanish tariff, 0 per cent. British exporters, the Chamber states, would do ell to avail themselves of the opportunities offered during is tariff war.

Electric Mine Locomotives in Russia.—The Westing-ouse Electric International Co., of East Pittsburgh, U.S.A., as received an order from the Amtorg Trading Corporation, he commercial representatives of the Soviet Government in merica, for 25 mine locomotives to be used in connection ith the electrification of the coal mines in the Donetz dis-rict. A distinctive feature of the locomotives is that they ill have adjustable wheel bases so that they can be operated n tracks from 24 to 30 inches in width.

Russian Electrical Manufactures.—A message from eningrad says that two 8,500-kW generators and 6,000-kW ansformers, the first of their kind constructed in the Soviet nion, have been turned out for the Volkovstroi concern by he Elektro Trust works. According to Swedish engineers orking for the Volkovstroi, the new Russian generators and ansformers approach in excellence Swedish and British akes.—*Reuter's Trade Service* (Moscow).

Irish Free State Electrical Imports.—The Irish Free State Ministry of Industry and Commerce has now issued detailed figures of imports for the first six months of 1925 as compared with the corresponding period of last year. From these we have compiled the appended table, showing the value of the total imports of electrical machinery and apparatus into the Free State and the amount attributed to the United Kingdom as country of shipment but not necessarily of manufacture:—

	Total. January to June.		U.K. Share. January to June.	
	1925. £	1924. £	1925. £	1924. £
Electric wires and cables	51,516	33,733	42,209	28,786
Teleg. and telephone instruments and apparatus	16,956	20,029	16,769	19,925
Electric lamps and parts	22,830	21,562	22,443	20,152
Batteries and accumulators	12,429	9,749	11,751	9,038
Radio sets and parts ...	23,035	69,337	22,373	68,094
Other electrical goods and apparatus ...	32,378	62,493	30,599	60,180
Electric generators ...	6,445	4,058	6,050	3,920
Electric motors	13,549	8,942	13,353	8,520
Other electrical machinery	33,591	19,491	32,013	18,452
Total	£212,729	£249,394	£197,560	£237,067

It will be seen that while wide variations are shown in the different classes of goods, the 1925 imports show a drop of £36,665 as compared with those of last year. All but £15,169 of the goods came from the United Kingdom, and of the balance £8,628 is attributed to Belgium, £3,724 to Germany, and £2,817 to "other countries."

The French Electrical Industry.—In the course of an article contributed to *Commerce Reports*, the United States Consul at Paris says that the amount of new capital invested in the French electrical industry up to September this year was $1,154,500,000 fr. as compared with 764,000,000 fr. for the whole of 1924. The bulk of this (875,500,000 fr.) was absorbed by electricity supply companies, while manufacturing firms took 153,200,000 fr.

The German Electrical Industry.—According to statements made by the price bureau of the Central Union of the German Electrotechnical Industry, the increase in the prices for manufactures which took place in July was made on the advice of the bureau and not on a decision arrived at by the bureau. Previous to this advance the competition which obtained had resulted in great losses. If it is assumed that the electrical industry had a turnover of from 500 to 800 millions of marks in 1924 and the loss through the reduction in prices in that year is taken at from 10 to 12 per cent., the lower receipts amounted to 80 millions. At present 87 firms belong to the price bureau as compared with 90 a year ago, and the bureau is of the unanimous opinion that if a further improvement of about 10 per cent. in current prices could be obtained with the same turnover, the works would be relieved of anxiety concerning the raising of funds for renewals and the production of reasonable balance sheets.

The report of the Electricity Company (late Lahmeyer) of Frankfort-on-Main, states that the expectation that with the return of regular currency conditions the electricity and tramway undertakings would also make an upward movement had in general been fulfilled, as most of the undertakings had been able to pay a dividend for the past year. It would, however, be wrong to assume from this circumstance that all the difficulties experienced by those concerns had been overcome. Their reserve funds had either been lost or were no longer available for use. Besides works of renewal, extensions were necessary and capital was required. The constructional departments of the company have been well employed and an abundance of orders is also on hand for the current year. The net profits for 1924-25 amounted to 1,610,000 marks and a dividend at the rate of 8 per cent. is proposed on the ordinary shares.

The Rhenish-Westphalian Electricity Works Company, of Essen, whose intention to pay a dividend at the rate of 8 per cent. out of net profits of 12,030,000 marks in 1924-25 has already been reported, states that the sales amounted to 1,099.47 million kWh hours as compared with 696.38 millions in 1923-24, although the latter year suffered from the effects of the occupation of the Ruhr. Nevertheless, the increase last year was still 11 per cent. over the maximum, which was attained in 1922-23. The present capacity of the works is 475,000 kW, and to meet the growing demand the cables were extended and now comprise about 620 miles of 100,000-V conductors with nearly a further 100 miles in course of construction. The company is introducing 220,000-V lines, and is linking up with the power station of the Mayence Company at Hochst near Frankfort-on-Main.

New Belgian Companies.—The Société Industrielle et Commerciale Electro-Mécanique S.A. ("Sicem") has been formed at Ostend with a capital of three million francs to deal in electrical apparatus, to construct tramway systems, power and transmission works, &c.

The Union Electrotechnique is the name of a company recently formed in Molenbeek-St. Jean, with a capital of one million francs, to manufacture and deal in all classes of electrical apparatus, but more especially ventilators, bells and meters.

The Austrian Radio Market.—Broadcasting has become very popular in Austria, but the radio apparatus business recently experienced trouble owing to the over-estimation of the demand which sprang up with the commencement of broadcasting, resulting in dealers being left with large stocks. A good deal of apparatus is imported in spite of the fact that there are a number of Austrian manufacturers, and equipment is even exported to Czecho-Slovakia, the Balkans, and Poland.

Electricity Supply in the United States.—A review of American industry published in *Commerce Reports* recently shows that the electric power industry has made remarkable progress in the last three years. As an index the position in 1919 is given as 100 and on this basis the industry reached 136 in 1922-23 rising to 148 in 1923-24, and to 158 in 1924-25. Only one branch of industry has developed to a greater extent, *i.e.*, the "five and ten cent store" business.

British Goods Campaign.—The Federation of British Industries has written to the Government urging the desirability of a campaign for promoting the sale of British goods. One of the suggestions is that the Government should allot a definite fund sufficient to run an extensive advertisement and publicity campaign on a national scale for at least two years, by means of newspaper advertisement, poster and other publicity. Every effort it is suggested should be made to encourage and where necessary co-ordinate with this central campaign, campaigns for their particular products by individual trades and individual industrial centres. The subject is one possessing special interest when we are at the beginning of the great shopping period of Christmas-time.

Locomotive Depôt Improvements.—Improvements involving an expenditure of £43,000 are to be made at the Whitemoor locomotive depôt of the London & North-Eastern Railway. Among the new plant which will be installed is an electro-mechanical coal-handling equipment.

Lighting and Power Notes.

Australia.—New South Wales.—According to the *Industrial Australian and Mining Standard*, the New South Wales Ministry has now definitely decided to abandon the Jackadgery hydro-electric proposal. The scheme to harness the waters of the Shoalhaven River to provide power for the south-eastern portion of New South Wales is to be pushed forward. Mr. Carter, engineer of the Public Works Department, has made a report, in which it is estimated that the scheme would involve an expenditure of about £1,679,000, and would make available 50,000 h.p. Constructional work would extend over about ten years. The Shoalhaven scheme would form a connection between the Burrinjuck and Port Kembla schemes. It is anticipated that the initial stage of the work to serve Goulburn and the Federal capital with power would be completed within three years, and would cost £504,000.

Victoria.—The Victorian Electricity Commission has now completed two years' operations in the western district of the State. The main transmission line from Geelong to Warrnambool is 116 miles long, and operates at 44,000 V. The supplementary h.p. lines, which serve towns off the main route, spread over 123 miles, and are operated on 6,600 V and the l.p. recticulation accounts for 103 miles of lines. Of the total of 324 miles, 49 miles of 6,600 V and 28½ miles of reticulation were put into operation during the last year.

Canada.—Electrical Development.—The *Financial Times* states that the Quebec Power Co., according to Montreal advices, has purchased the Laurentian Power Co., which owned in fee simple the water power at Seven Falls on the St. Maurice River, 35 miles from Quebec, with a total plant capacity of 18,000 h.p. Provision has been made at this plant for the addition of another set of 6,000 h.p.

China.—Electrical Development.—According to the recently-issued report of the Société Indo-Chinoise d'Electricité, the central electricity supply stations at Hanoi and Haiphong are making steady progress. In the first-named plant a new 1,500-kW generating set is being installed. A concession covering 20 years has been concluded with the Hanoi authorities. At Haiphong the company has acquired the steam-operated station which formerly belonged to the Société Industrielles de Chimie d'Extrême Orient, and a new engine and generator are to be added. The Indo-Chinese Co. is also establishing a power station in the town of Nam-Dinh, which is expected to be ready for operation early next year.

Continental.—Czecho-Slovakia.—*British Industries* states that the first stage in the electrification of Bohemia is nearing completion, and it is expected that the new power station at Ervenice, about 70 miles from Prague, will be put into operation in a month's time. The enterprise is under the joint ownership of the Czecho-Slovak Government, the Province of Bohemia and the Municipality of Prague. The programme of electrification, which has been spread over a number of years, also comprises a gradual change from steam to electric power at the Wilson station at Prague and on some of the lines in the vicinity of the capital. The erection of a hydro-electric station on the River Moldau near Prague is to be taken in hand in the early part of next year.

Belgium.—The Cockerill Co., of Seraing, the largest industrial undertaking in Belgium, has recently added an 8,000-h.p. gas engine and generator to its electric power plant, bringing the total capacity up to 37,000 h.p. During the past year the output of the various plants increased from 85 to 98 million kWh.

France.—A concession has been secured by the Société d'Energie Electrique du Tarn to establish h.p. overhead transmission lines between the hydro-electric stations which the company is establishing on the river Tarn between Courri and Truel, and the steam-operated station of the Compagni Générale Industrielle at Carmaux. The lines will transmi energy at 60,000 V.

Bulgaria.—The Société d'Electricité de Sofia et Bulgarie increasing its capital with the object of extending its opera tions. At present the company owns a hydro-electric statio at Pantcharevo, about 10 miles from Sofia, and a steam operated station in the city itself. These having become insuffi cient to meet the growing demand, it has been decided t erect a new plant about six miles from Sofia with an initia capacity of 18,000 kW. The energy will be transmitted to th city at a pressure of 35,000 V.

Cuba.—Electrical Development.—A company has bee formed at Habana with a capital of $2,000,000 to construct a electrical installation which will utilise certain waterfalls and supply electrical energy to a number of industrial concern and railways.—*Reuter's Trade Service* (Habana).

Dolgarrog.—Electricity Supply Restored.—The electricity supply for the whole of the area served by the North Wales Power Company is now fully restored. One of the 5,000-kW hydro-electric generators in the new power house a Dolgarrog was started up on November 16th and the 1,200-kW machine in the old power house is also running.

Glasgow.—Electrical Progress.—The Corporation Electricity Department reports that twice within the past few days fog has been responsible for establishing new records in output. The previous record, 1,000,000 kWh in one day, has been exceeded on two occasions, while the record maximum demand of 88,000 kW has also been established.

Ibstock (Leicestershire).—Electricity Supply.—It is understood that the Leicestershire and Warwickshire Electric Power Company has purchased a site in Ibstock for the erection of a transformer station. Many of the business premises and residences in the district have been wired for an electricity supply.

Lanark.—New Sub-Station.—The Clyde Valley Electrical Power Co. is to erect a sub-station with a view to providing an electricity supply for the town.

Leeds.—Electricity *v.* Gas.—In connection with the erection of houses on the Corporation housing estates, the Improvement Committee has instructed the city engineer to prepare plans for nearly 100 houses, to be fitted exclusively with electricity, or gas. Each house will contain only one open fire, the object of the scheme being to reduce the smoke nuisance. The plan is to establish "all-electric" or "all-gas" colonies, in which not only the houses, but the streets also, will be served exclusively with one system or the other.

Lichfield.—Electricity Agreement.—The agreement for the supply of electricity in bulk by the Walsall Corporation to the City Council has been completed and orders have been given for the necessary mains and sub-station equipment.

London.—Bermondsey.—The Borough Council has received sanction to a loan of £8,026 for mains extensions, services, and meters.

Loughborough.—Wiring of Small Houses.—The electrical engineer has been instructed to prepare a scheme for assisted wiring in the borough and to report to the Council.

Louth.—Electricity Supply.—The Town Council has received a proposal for a supply of electricity from Grimsby. It is proposed to lay the cables along the railway and to supply intermediate villages with electricity.

Millom.—Electricity Supply.—Reporting on his interview with the Electricity Commissioners, the engineer for the electricity scheme stated that no objections were raised to the scheme, with the exception that the Commissioners questioned the ability of the Council to raise the necessary loan. The engineer did not consider that there would be any difficulty in that respect, and suggested that the Council should write the Commissioners for their consent to the scheme and ask for the co-operation of the local M.P.

Nantwich.—Electricity Agreement.—It is reported that the Electricity Distribution of North Wales and District, Ltd., and the Urban District Council have come to terms in connection with a scheme for providing an electricity supply for the town.

Northern Ireland.—Carnlough (Co. Antrim).—At a recent meeting of the ratepayers, a committee was appointed to make the necessary arrangements for obtaining an electricity supply for the town.

Paisley.—Year's Working.—The report on the working of the Corporation electricity undertaking (engineer, Mr. W. Blair Smith) for the year ended May 15th last, shows a total income of £92,108, as compared with £89,836. The working expenses amounted to £53,808, as against £51,206, leaving a gross profit of £38,299 (£38,630), to which was added a balance in hand at the beginning of the year of £7,298, making a total of £45,597 available. This was disposed of as follows: Loan and other charges, £35,235; transferred to reserve, £6,000; balance carried forward, £4,362. The capital expenditure during the year, which included £9,730 for mains, and £7,882 for transformers, &c., amounted to £26,221. The sales of elec-

trical energy increased from 9,236,623 to 10,605,733 kWh, and the maximum supply demanded rose from 5,000 to 5,390 kW. The 6,000-V, 3-phase e.h.p. ring main feeder was completed and put into operation during the year, and a commencement was made upon large extensions of electric street lighting in the town.

Romsey (Hants.).—Electricity Agreement.—The Town Council has sealed an agreement for an electricity scheme with Christy Bros. & Co., Ltd.

Rugby.—Price Reductions.—The Urban District Council is to reduce the charges for electricity for heating and cooking from 2d. to 1½d. per kWh.

South Africa.—Cape Town.—An agreement has been entered into between the Corporation and the Tramways Co. for the Corporation to supply the whole of the company's requirements of electrical energy for a period of ten years from January 1st, 1927. The price per kWh for the first five years is to be 1.0625d. measured on the d.c. bus bars at the different converter sub-stations. For the remaining period the price is to be reduced by a figure representing any decrease in the total cost of generation. An annual consumption of 4,750,000 kWh is to be taken or paid for. The anticipated revenue to be received for this supply is approximately £24,000 per annum and the capital expenditure for converters, switchgear and h.p. cable connections will be about £20,000.

South-East Lancs. Electricity Advisory Board.—The Board has considered the proposal for a bulk supply of electricity to Eccles Corporation from Salford Corporation and has recommended to the Electricity Commissioners that the proposed contract between Salford and Eccles be approved.

A communication has been received from Wilmslow Urban District Council protesting against the electricity charges made by the Alderley and Wilmslow Electric Supply, Ltd., and the Board has passed a resolution that the Engineering Advisory Committee be instructed to investigate the question of supply in the area served by the company with a view to recommending the adoption of any course which would improve and cheapen the supply in the area.

Stockport.—Electricity in Bulk.—The New Mills and Marple Urban District Councils have concluded separate agreements with the Corporation for a bulk supply of electricity to their districts.

Sunderland.—Electricity Supply.—The Sunderland Bridge Council has decided, at the request of the Rural District Council, to be represented at a conference of several authorities to discuss the question of purchasing electricity in bulk and distributing it at a cheaper rate and under better conditions than at present.

United States.—Hydro-Electric Development.—The *Electrical World* states that the first unit of the Yonah hydro-electric plant, fourth in a series of six power developments planned for the Tallulah, Chattooga, and Tugalo River system of the Georgia Railway and Power Co., was recently put into service. The set has a capacity of 12,500 h.p. The dam is 70 ft. high and 900 ft. long. The power house, when completed, will contain three units with a combined capacity of 25,000 kW. The other two units will, it is anticipated, be ready by January 1st. Two more developments will be started as soon as the Yonah plant is completed. They are the Nacoochee project, which will be at the head of Lake Rabun, and the Burton project, which will be at the foot of Lake Burton. The two will add 16,500 h.p. to that already developed and will bring the total power of the system up to 279,500 h.p. The new plant will supply energy to Atlanta and other cities, and energy will be transmitted at 110,000 V.

Whitchurch.—Electricity Supply.—The Rural District Council has decided to support an application by the Whitchurch Gas Co. for an Order to supply electricity in the rural area.

Wirral.—Inquiry.—The scheme for the electrification of the Wirral Peninsular, the first part of which will cost £110,000, formed the subject of an inquiry which occupied three days (November 17th, 18th, and 19th) at Birkenhead. The inquiry was conducted by Colonel T. C. Ekin, Chief Inspector to the Electricity Commissioners. Mr. Craig Henderson, for the Wirral Council, said the Council wanted to borrow £110,000 for its electricity undertaking. It had obtained leave from the L.M. & S. Railway Co. to lay mains along the line of the railway as far as Meols. A supply would also be taken from the Mersey Power Co.'s station at Ellesmere Port. The Wallasey main would be for 6,600 V, and the one from Ellesmere Port 33,000 V. Mr. C. R. St. John (engineer to the scheme) said that there were about 1,000 houses already wired for lighting in the area.

Mr. Burton T. Hawkins, electrical engineer, Wallasey Corporation, stated that his Council objected to Moreton being supplied with electricity from Birkenhead. The Wallasey Corporation had entered into an agreement with the Wirral Council to afford it a bulk supply. Mr. J. E. Nelson (electrical engineer, Mersey Power Co.) said that his company had entered into an agreement with the Wirral R.D.C. to supply electricity in bulk. Mr. Wooll, for the Wirral Ratepayers' Association and the Parish Councils of Willaston and Hooton, said that the scheme was unreliable and extravagant, and was beyond the financial resources of the district.

Mr. G. P. Shallcross, electrical engineer of Birkenhead Corporation, said he had prepared a scheme to supply the Wirral, providing for 12 miles of overhead feeders, 3½ miles of underground lines, and 14 miles of l.p. mains, with six sub-stations. The total expenditure was about £60,000.

Mr. W. H. Jones, chairman Heswall Parish Council, said his Council would support the Birkenhead scheme. Mr. F. Clarke, Chairman of the Executive Committee of the Ratepayers' Association, stated that eleven parishes had passed resolutions rejecting the Wirral scheme.

Mr. Wooll claimed that the Wirral Council's scheme was not as cheap or as efficient as that offered by Birkenhead. The inquiry was concluded.

Worcester.—New Plant.—The Electricity Committee has recommended to the City Council that a new 6,000-kW turbo-alternator be installed at the Hylton Road works, at an estimated cost of £47,700. The proposal has been referred to the Finance Committee for consideration.

Tramway and Railway Notes.

Australia.—Melbourne.—*The Industrial Australian and Mining Standard* reports that the Melbourne and Metropolitan Tramways Board, owing to a variety of reasons, has suffered a severe loss in its transactions during the past year. Mr. A. D. Murdoch, the general manager, in giving evidence before the Arbitration Court, stated that for the two years 1923-1924 the net revenue had decreased from £471,176 to £282,203, and the surplus of £8,862 in 1923 became a loss of £125,465 in 1924; while for the last financial year the loss had increased to £232,000. Mr. Murdoch gave, as reasons for the serious loss sustained by the Board, severe motor-'bus competition, a fortnight's strike, and the great increase in privately-owned motor vehicles.

Consideration has been given by the Victorian State Cabinet to the future control of the metropolitan tramways. A suggestion has been made that when the term of the present Melbourne and Metropolitan Tramways Board expires the board should be abolished, and that in its place there should be established a board consisting of three experts in tramway matters. Other proposals which have been made are that the control of the tramways should be transferred to the Railways Commissioners, or that the board should be enlarged to embrace more direct municipal representation.

Sydney (N.S.W.).—The eastern section of the Sydney city railway will be opened for traffic in July next year. The structural work of the St. James' and Museum stations is nearly complete, Devonshire Street subway alterations are in hand, and the surface work between Devonshire Street subway and Cleveland Street bridge is in progress. The expenditure on the work up to July last was £2,340,100.

Continental.—Spain.—The Sol-Quevador section of the Alphonse XIII underground electric railway in Madrid has recently been completed and opened for traffic. The line is an extension of the Sol-Venta section, the two forming a railway which runs from the east to the west of the city, a distance of nearly four miles.

Sweden.—Successful trial runs with electric goods trains took place on October 13th on the Moholm-Falkoping section of the line between Stockholm and Gothenburg, the electrification of which will soon be completed. Four trains were despatched simultaneously in each direction, the longest consisting of 50 trucks. A fully-loaded train maintained a speed of 37½ m.p.h.

Dover.—Loan Sanctioned.—The Town Council has received from the Ministry of Transport sanction to a loan of £7,184 for the reconstruction of the tramway track in Snargate Street, Northampton Street, and Stroud Street.

Glasgow.—Through Running.—According to the *Electric Railway and Tramway Journal*, Mr. Dalrymple, general manager of the Corporation tramway undertaking, is to confer with the manager of the Lanarkshire Tramways Co., on the question of mutual through-running.

Dudley.—Light Railway Order.—The Minister has recently made an Order authorising the abandonment of parts of the Dudley and district light railways.

Liverpool.—Tramway Improvements.—In a statement at a recent meeting of the Tramways Committee, Mr. F. C. Wilson said that the new turbine at the Lister Drive power station would probably be put into service within the next two months. Further tramway extensions were contemplated, and new and improved types of tramcars were under consideration.

London.—Proposed New Tube.—The Metropolitan Railway Co. proposes to construct a new tube from Baker Street to Kilburn and Willesden Green, and powers to construct it will be sought in the next session of Parliament. The line will be three miles in length and will act as a loop line to deal with the increasing traffic between Baker Street and Uxbridge and Aylesbury. There will probably be new stations at Maida Vale and Kilburn. The cost of the scheme is estimated at £2,000,000.

New Tube Cars.—The Underground Co. has placed orders with Messrs. Cammell, Laird & Co. and the Metropolitan Carriage, Wagon & Finance Co. for 78 new cars required for the Morden and Kennington extensions, which will be ready for service next midsummer.

Walthamstow.—Loan.—The Urban District Council has applied to the Minister of Transport for sanction to a loan of £98,000 for tramway purposes.

Telegraph and Telephone Notes.

Aircraft Radio.—Wave-length.—For wireless communication with aircraft a limited wave-length band in the neighbourhood of 900 metres has been allotted, and while this has sufficed in the past, it is now in danger of being very overcrowded. When, as the *Financial Times* points out, it is considered that the average number of machines arriving at, or departing from, the London terminal aerodrome daily is about 70, and that there are frequently five or more machines within the British control area simultaneously, it is not difficult to understand that interference between machines and ground stations frequently occurs. The problem will be rendered the more acute when, as will possibly take place in the future, facilities are afforded to airway passengers to send private messages in a similar manner to that in vogue on board ship. As a partial solution, a scheme will be tried shortly in which the larger machines will carry an operator who will transmit and receive all his messages by telegraphy instead of telephony. Another aid is being sought in the use of shorter wave-lengths.

Imperial Wireless Committee.—South African Agreement.—The first fruits of the work of the Imperial Wireless Committee, which has been in session since last June, is a "beam" wireless agreement, which was signed on November 19th, between representatives of the British Post Office and the South African Wireless Co. Agreement has been reached on the handling of "beam" traffic in the two countries, and also as to the division of revenue. Stations for communication with South Africa are approaching completion at Bodmin and Bridgewater, whilst a corresponding station is being erected near Cape Town, and it is expected that the stations, which will be under the independent control of the British and South African Governments respectively, will be open for traffic next spring. The rates to be charged in the new service are one-third below the ordinary cable rates.—*Reuter.*

Italy.—Telephone Service.—A Bill dealing with the special assignment of a hundred million lire (about £1,000,000) per annum for six years to provide for the systematising of the inter-urban telephone communication service of the State will shortly be submitted for the approval of the Italian Parliament. The past want of organisation and lack of funds have brought matters to a crisis. The existing plant is quite inadequate for present needs, and renders impossible the necessary facility for telephonic communication over long distances.

Pacific Cable.—Duplication Dispute.—The Canadian Postmaster-General, the Hon. Charles Murphy, following the award of £2,260,000 contracts by the Pacific Cable Board for the duplication of the existing "All-Red" cable between Bamfield (Canada) and Fiji, declares that the duplication of the cable was decided on in the absence of the Canadian representatives on the Board, which controls the cable in the joint interests of Great Britain, Canada, Australia, and New Zealand. He adds that the contracts were awarded despite Canada's protests and in defiance of the Imperial Cable Act, which specifically states that no new work can be undertaken without the full concurrence of all the parties concerned. He has recommended his Government to withdraw from partnership in the cable, and urges that a new Imperial Act should be passed to enable Canada to "get her money back."

The contracts were placed last month. The section between Bamfield and Fanning Island, which is 3,458 miles in length and is the longest cable in the world, is being made by the Telegraph Construction and Maintenance Co., of Greenwich, while the section between Fanning Island and Suva (Fiji) is in the hands of Messrs. Siemens Bros., of Woolwich.

The *Daily Express* understands that Mr. Murphy has circulated among members of the Canadian Parliament and members of the Pacific Cable Board a pamphlet setting out his protest against the Board's "illegal and unbusinesslike action." He discloses in a cablegram dispatched to the Board last January his astonishment at receiving notification from Sir William Mercer, the chairman, that the Board had "no intention of consulting any of the Dominion Governments previous to awarding the contracts for the duplication of the cable." Then he claims to have established that:—

1. Tenders which the Board proposed to accept were "unduly high, even in the opinion of the Board's own engineers."
2. Following Canada's representations, the contract price was considerably reduced, comparisons having been made with the cost of laying new cables elsewhere.
3. No investigation was made by the Board into the wireless "beam" system.
4. No consideration was given by the Board to the installation of cables having a greater capacity than the Board's moderate requirement of 600 letters a minute, although recent inventions have given cables practically an unlimited capacity.
5. By providing for the use of a British "covering" material, the Board had indicated its fear of infringing the American "Permalloy" patents, and had actually earmarked £150,000 in the contract price for damages in the event of possible litigation; also that the Board had subsequently paid £107,000 for a licence permitting it to use a new "covering" or "loading," known as "Numetal."

As soon as the award of the contracts was announced, Mr. Murphy cabled Canada's willingness to withdraw from partnership in the cable enterprise and suggested that she should receive her share of the Board's savings. Otherwise, he declared, "more than £600,000 of Canada's money will be spent illegally and in total disregard of her wishes. Unless it is established beyond question that the duplication is an urgent public necessity, Canada would prefer to receive her share of the estimated cost, rather than agree to a disbursement of funds in a manner unpopular to Canada."

Mr. Murphy pointed out that as, apparently, the future prosperity of the Pacific cable was assured—the surplus last year amounted to £167,893—Canada's further assistance was not required. "The main purpose of the cable is to link Great Britain and Australia, and Australia also imposes a substantial terminal charge on every message received, yielding a revenue of about £200,000 a year. Canada has no such commercial interest, and therefore demands payment of her five-eighteenths share in the accumulated reserve."

The Board's reply was that compliance with Canada's wishes would require the passage of another Imperial Act, as it had no power to pay out funds other than for the laying and management of cables. Canada paid no part of the original capital, which the National Debt Commissioners of Great Britain wholly advanced.

Mr. Murphy replied that Canada, having taken no share in the liabilities of the Pacific cable, is not entitled to a share in the assets, and he contends that the Board wrongly assumed that Canada's agreement in 1921 to a duplication of the cable between Honolulu and New Zealand authorised the present expenditure. He asserts that the Board "wrongly pretended" that a letter by one of Canada's representatives on the Board bound Canada to the duplication of the cable from Bamfield to Fiji. He maintains that this letter referred only to the duplication between New Zealand and Fiji.

Russia.—Telephone Service.—With further reference to our recent note announcing the Soviet Government's intention to spend £20,000,000 on raising the telephone service in Russia to modern standards, it is reported that large American electrical companies are to be invited to co-operate in the project. Russia has at present only one telephone to about every 1,160 people; during 1922 the number of telephones in Petrograd decreased from some 40,000 to 8,966, though the population of the city increased by 300,000; while in Moscow, the headquarters of the Soviet, telephones decreased from more than 54,000 to about 25,000, in the face of an increase of population, during the same period, of some 500,000. The Government desires to increase the number of telephones in the country from 120,000 to 1,000,000, linking up the village centres over widely-scattered areas. It is also anxious to establish long-distance communication with Warsaw, Berlin, Paris, and London. It is understood that the International Standard Electric Corporation has informed the Soviet Government that it is not prepared to re-enter Russia until it has been compensated for the confiscation of its plant, which was nationalised by the Government after the revolution. The Government, while making no guarantees, is said to be willing to discuss terms for a reasonable adjustment of the claim.

The Telegraph Service.—Speed of Transmission.—The Post Office is experimenting with German telegraph apparatus, by means of which six separate messages can be sent over one wire at, it is claimed, a speed of 100 words a minute, says *The Times*, which explains that one advantage of the invention is that it can be used over ordinary telephone wires. Different wave-lengths are employed, and thermionic valves are used which set up oscillation. At the receiving end there is a filter which separates the different messages.

Radio Notes.

Broadcasting Committee. — Inquiry Commenced.—The Committee which has been appointed by the Government to inquire into the radio broadcast service met at the House of Lords on November 19th in private. Sir Evelyn Murray, Secretary to the Post Office, presented a statement with reference to the relations of the B.B.C. to the Government and the Press, and was questioned thereon by members of the Committee. On December 3rd and 4th the public will be admitted, when evidence is given by the British Broadcasting Co., Ltd., and the Wireless League.

Ceylon.—New Station.—Experiments have been in progress since the end of September at the wireless station at Colombo, where new continuous-wave plant is in use, to ascertain whether it is possible to establish regular direct wireless communication on a commercial basis between Colombo and Perth, in Western Australia. Communication has been readily established, and the object of the experiments is to discover whether it can be maintained at all hours of the day and night and under all conditions, says *The Times*. The new plant will be used also for broadcasting purposes on an 800-metre wave-length.

New Wave-lengths. — Geneva Recommendation.—Severe jamming having been experienced recently by some of the B.B. Co.'s stations, it is understood that the International Wireless Bureau on November 20th advised by cable from Geneva that the following alterations should be made in the wave-lengths of three stations:—Leeds, 346 to 321.5; Edinburgh, 328 to 324.5; Nottingham, 326 to 327.5.

New Studio.—Oxford.—The new studio which the British Broadcasting Co., Ltd., has opened in Oxford was used for the first time on Monday evening, November 23rd.

(*Continued on page 863.*)

A Modern Electric Heater Manufactory.

The New Works of Messrs. Belling & Co.

We were recently afforded an opportunity of visiting the new "Bridge Works" at Enfield of Messrs. Belling and Co. These works, which stand on a 10-acre site, are the outcome of the very considerable progress made by the company since its inauguration in 1912. In that year the first "Belling" works were established at Enfield for the exclusive manufacture of electric fires, the original firebar with which all the fires were fitted being patented at that time. The demand for these fires increased so rapidly that larger premises were soon taken over at Edmonton, where the firm commenced the manufacture of other domestic electrical appliances, such as cookers, water heaters, &c. These premises were burnt down and rebuilt and enlarged in 1920, but the expansion of the business made it necessary to build a larger factory on modern lines, and the site at Southbury Road, Enfield, was chosen for this purpose.

Fig. 1.—The New Works.

Fig. 2.—Plating Department.

The new factory, fig. 1, consists of two separate buildings, the larger one, a 6-bay building, the factory proper; and a smaller 3-bay building which is now being equipped as a foundry, in which it is intended to turn out the whole of the castings for the Belling products. The premises are of fireproof construction, built entirely of steel and concrete, with roofing of corrugated asbestos arranged with steel and glass north lights, making it a well naturally-lighted works. The floor area of the factory proper is 23,400 sq. ft., and that of the foundry is 11,700 sq. ft.; it is interesting to note that four new bays are being added to the main shop. The works are laid out on modern lines, the various departments being arranged so as to facilitate the handling of the raw and manufactured materials, and the easy transportation of the products, in their various stages of production, between the departments. The larger building also accommodates the offices, which are arranged along the front of the building.

A central avenue, figs. 3 and 5, down the length of the main shop accommodates the benches and equipment for the assembling of the various parts for both the heating and cooking stoves, each of these products being dealt with by a separate department. The smaller processes of manufacture, such as the winding of the elements and the lacquering and blacking of the frames, &c., are dealt with in surrounding compartments. Nickel chrome element spirals are wound on the special winding machines, fig. 4, which provide horizontal high-speed revolving mandrels on which the wire is turned. A stout wire is used for the elements, and the spirals are mounted on specially-constructed fireclay bars which are prepared by another firm; this work is done on assembling benches near at hand. At the present time the cast frameworks for the various stoves are received from an outside source. On receipt, the castings are first filed down and then dealt with in the blacking room, fig. 6. Here the castings are sprayed by means of compressed air from an electrically-driven compressor, shown on the right of fig. 6, and then baked in electrically-heated ovens. The heating elements in these ovens were installed by Messrs. Belling & Co. When in use the ovens are heated up to a temperature of between 300 and 400 deg. F. After being blacked the frames are conveyed to the central avenue or assembling shops, where they are fitted with the elements, switches, &c.

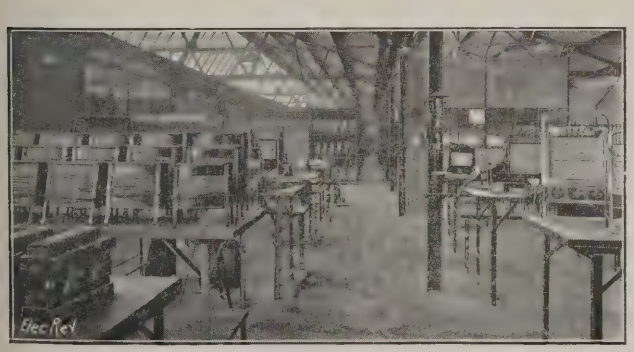

Fig. 3.—Assembling Benches.

Fig. 4.—Winding and Cutting Machines.

A large proportion of the products of the works is represented by the manufacture of electric fires constructed with light sheet metal frames. These frames are prepared sectionally on special stamping and

cutting guillotine machines, fig. 4. After being assembled they are treated in the blacking department in a similar manner to that in the case of the heavy cast frames. Before assembling in the frames, the element bars are electrically tested separately; and after the stove is built up it is tested as a whole both as regards the elements purely and also for leakage to the frames.

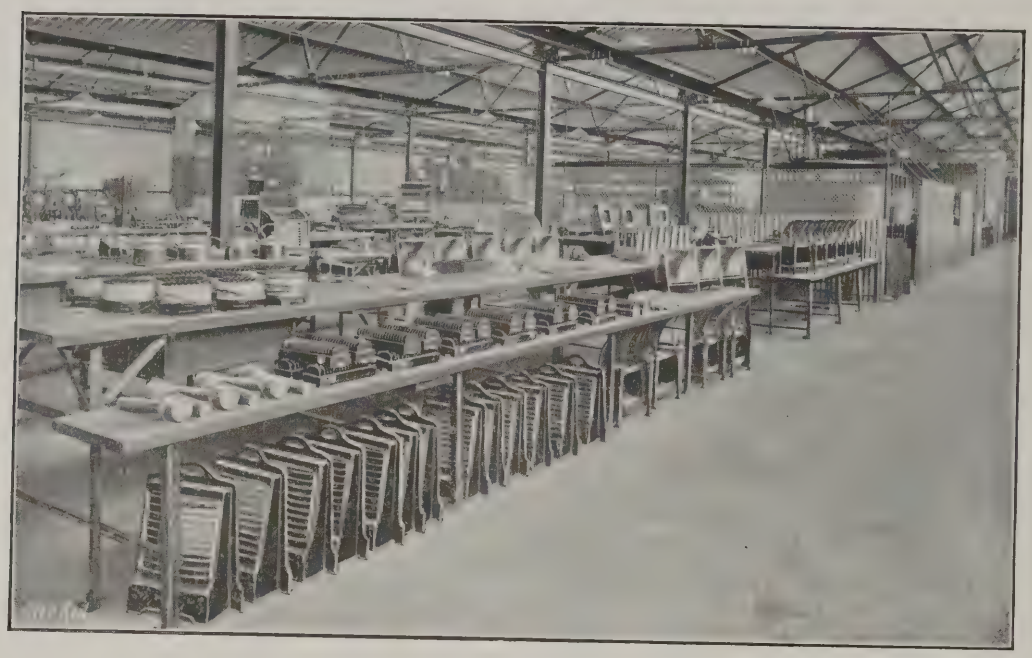

Fig. 5.—Central Avenue.

For the latter tests, a pressure of 1,000 V is flashed across the elements and the frames.

Many attractive designs of light brass and other metal frames are another feature of the works production, and these are treated in the electro-plating department, where any of a number of finishes can be given according to taste. The plating tanks are shown in fig. 2; some of them are electrically heated. Various stores are arranged throughout the factory, situated near where the stored contents are next to be required in the process of manufacture of the stove. In the case of the cooking stoves, the elements for the modern designs are made up as complete units and are not assembled in the frames, &c., until final dispatch, which, pending the completion of a railway siding, is done by road vehicles. A suitable sloped loading platform is provided for this purpose at the main entrance of the large building. Packing rooms are situated near the loading platform, the heavy packing being effected on the same level as the latter. For a water supply, the firm has had a well sunk on the site, from which water is pumped electrically to a 2,000-gallon tank raised on a brick column, fig. 1, to a level approximating that of the factory roof.

The electricity supply for the works is received from the North Metropolitan Electric Power Supply Co. It is metered and distributed in a special switchboard room, a 5-panel slate distribution board being erected for the purpose.

In all of the many designs of electric fires which are now produced at these works is incorporated the "Belling" multi-parabola fire-bar. The heating surface of this bar is made up of 75 small parabolic wells. The heat is generated in the spirals of nickel-chrome wire, which lie in the wells and give off their heat all round. The front of the spiral thus radiates heat direct into the room, while the heat round the back of the spiral is radiated by the wells, which were specially designed with this in view. The fire-bar itself is convex in shape to ensure that the heat radiates out over a wide area, and not merely in one direction only. In addition to being a highly efficient element, a claim made by the makers, the special construction of the multi-parabola fire-bar renders it reliable. The wire is almost entirely protected by being sunk just below the surface of the fireclay; there is thus small risk of the wire becoming broken. The "Corinthian" fire is an excellent example of the attractiveness which is a feature of many of the designs produced by this firm. It is designed particularly for use in the drawing room, and is pleasing in tone, with gracefully curved sides and simple but distinctive ornaments. The frame is sufficiently wide to effectively cover an existing grate without spoiling its general appearance.

Many forms of electric cooking appliances are included in the manufactures of the firm, from the complete cooking range down to the small portable boiling plate. Considerable importance is attached by the company to the question of water heating, and it has produced several sizes of immersion heaters.

Fig. 6.—Blacking and Stoving Room.

The Bradford Electricity Undertaking.

The Inauguration of an Interesting 20,000-kW Generating Set.

The Bradford Corporation claims to have been the first local authority to utilise powers conferred by Parliament for the public supply of electricity.

The Bolton Road Works were opened in September, 1889, and the Valley Road Works were first commissioned in 1897; they were later extended and the plant was added to from time to time. the first turbine in this station being installed in 1909, and the new plant inaugurated last week completed the change. Thus, turbo-generators of 59,000-kW capacity are now housed in an engine room that was designed in 1900 to accommodate 5,000 kW of reciprocating machinery.

Fig. 1.—Valley Road Works, 1925.

Mr. Thomas Roles, city electrical engineer and manager, gives the total cost of the latest extension as slightly over £100,000, and the new machinery was formally inaugurated on November 18th by Lieut.-Col. W. W. Ashley, Minister of Transport, and Mrs. Ashley, in the presence of Sir John Snell, Chief Electricity Commissioner, and other distinguished guests. Fig. 1 is an aerial view of the generating station.

The new turbine, manufactured by the English Electric Co., Ltd., as will be seen from fig. 2, is a two-cylinder tandem combination, with the impulse elements confined to the h.p. end and the reaction elements to the l.p. end. The latter cylinder is of the double-flow design, and there are two main bearings either side of the h.p. rotor and two main bearings either side of the l.p. rotor. The two turbine and the alternator rotors are coupled together through "English Electric" standard multi-tooth couplings, and each turbine rotor is provided with a Michell double-thrust block housed in the h.p. and intermediate bearings.

The h.p. cylinder has interesting features: the angle of expansion from the first nozzle in front of the first stage to the exit from the last row of blades is very good, and was attained by the employment of an unusually large number of stages for a comparatively small heat drop. The limiting factor in this direction has hitherto been the difficulty of locating sufficient number of stages between adjacent bearings without running through the first critical speed. With the usual construction of built-up rotors with the disks bored in the centre to take the shaft, the hubs of the disks have to be thickened to take the stress concentration with a reasonable factor of safety. This gives a definite minimum pitch between adjacent bearings, if the first critical speed is to be avoided; avoiding the first critical speed by thickening the shaft has distinct limitations because of the attendant increase in h.p. gland losses, and so by cutting the whole of the h.p. rotor from one forging, the English Electric Co. has obtained twelve-stages, figs. 3 and 4, giving a remarkable angle of expansion in an overall length which could only have accommodated a seven stage cylinder of the usual built-up type.

The diameter of the shaft and total weight of the rotor are, in addition, considerably less than could have been realised with the built-up construction, and other features are the unusually small diameter and, consequently, low blade speed. We see here a sharp departure from a practice which has hitherto been almost universal among designers of impulse machines.

This small-diameter, multi-stage construction provides a low-stressed rotor with a uniformly good velo-

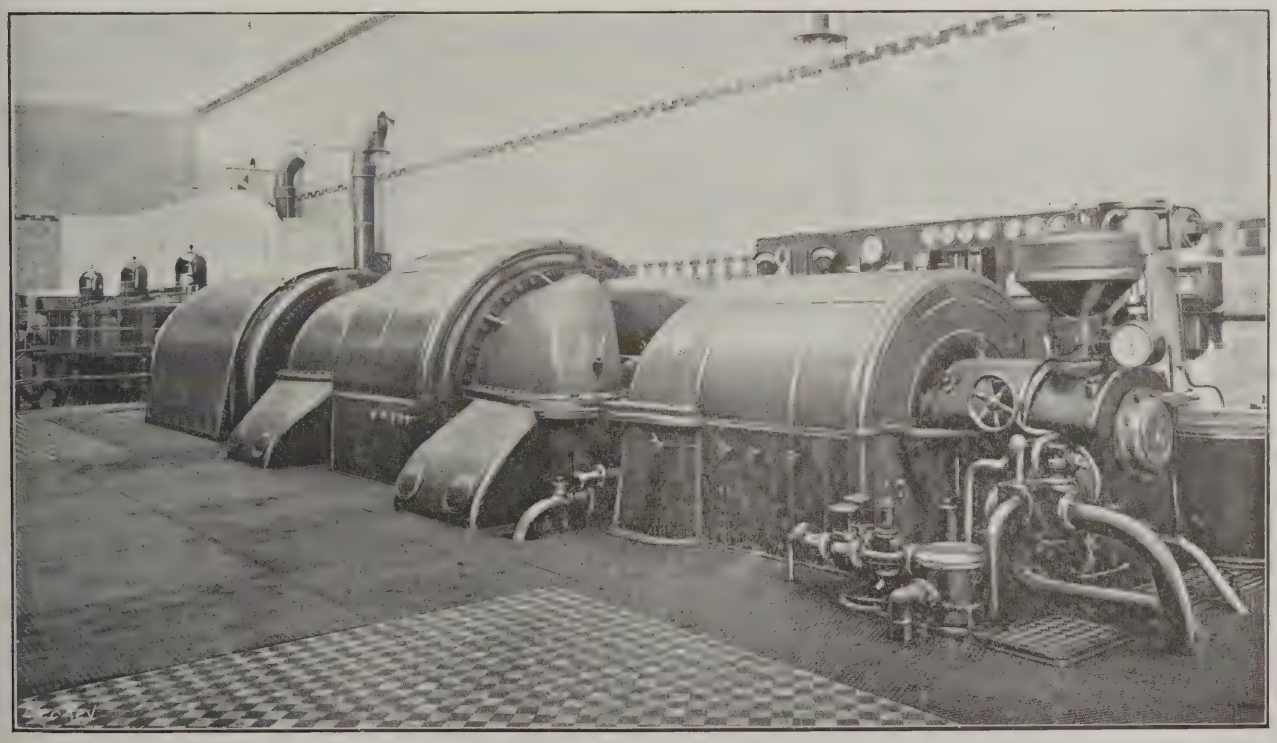

Fig. 2.—The New Two-Cylinder, Impulse-Reaction, 20,000-kW, 3,000-r.p.m. Turbo-generator.

city ratio and circumferential steam admission, and permits a stator casting of exceptionally small proportions, the internal stressing of which is such as to minimise distortion. The division between the cast-steel and cast-iron sections comes after the eighth stage, and thus divides the total cylinder into two very simple castings of small dimensions with a very small temperature drop across each section.

This design for the h.p. cylinder represents a bold departure from, indeed, almost a reversal of, those general principles which have until recently governed the design of most impulse machines. While having a blade development and angle of expansion comparable with those of the highest efficiency reaction design, the safety characteristics of an exceedingly low-stressed impulse machine are preserved, and it would appear that the necessity for the usual compromise between safety and efficiency has thus been largely obviated.

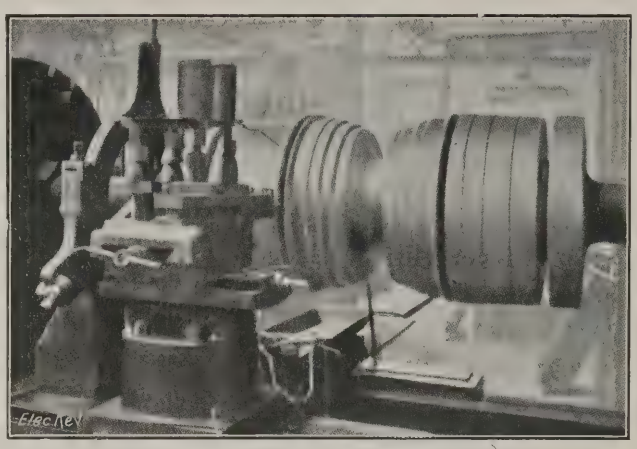

Fig. 3.—Turbine l.p. Rotor being Machined.

The steam exhausted from the h.p. casing passes through two pipes on either side of the shaft axis, while the large volume of l.p. steam is dealt with on the double-flow reaction principle, passing something like 200,000 lb. of steam per hour, it being considered sounder practice to divide the steam and thus halve the blade height rather than introduce single-flow devices which necessitate fine clearance where it is least desirable. The balance of end thrust with the double-flow exhaust must also assist the running characteristics of the turbine materially.

An annular space between the fourth and fifth rows of the l.p. blades on either side of the centre is an extraction belt for the first stage of regenerative boiler feed water-heating system, the two belts being coupled together by a connecting pipe on the under side of the frame, the extracted steam being taken to a feed heater under the engine room floor. Exhaust steam from the condenser air ejectors and gland drains is used for the second stage.

The turbo-generator, designed for a maximum continuous output of 20,000 kW, has its lowest steam consumption at 16,000 kW, the steam pressure being 190 lb. per sq. in., temperature 659 deg. F., and vacuum 28½ in. A noteworthy feature of the alternator (by Messrs. C. A. Parsons & Co., Ltd.) is its large output at the high speed of 3,000 r.p.m. The peripheral speed has been kept moderate by the adoption of a comparatively long rotor, the over-all length of the alternator and exciter being 22 ft. 8 in., and the outside radius of the stator casing 4 ft. 1¼ in.; it is a 6,600-V, 2,190-A, 50-cycle, 0.8-p.f., totally-enclosed machine.

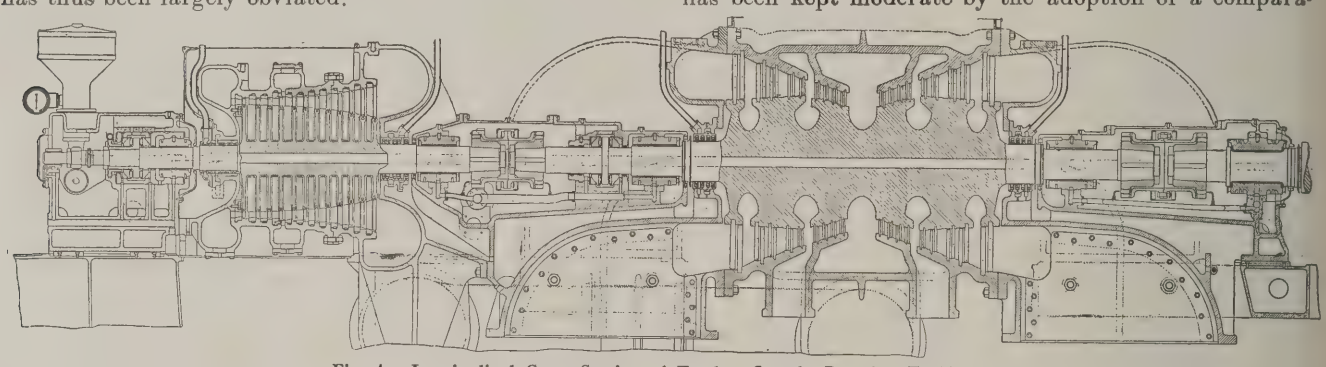

Fig. 4.—Longitudinal Cross Section of Tandem Impulse-Reaction Turbine.

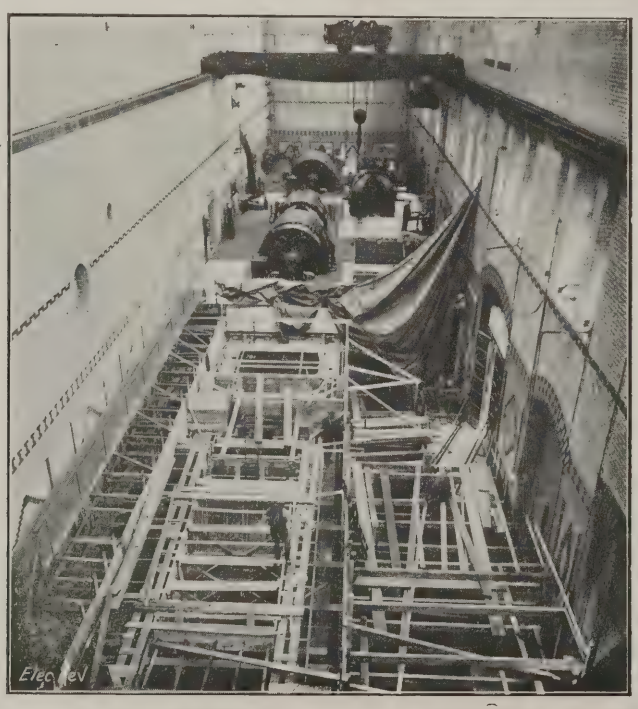

Fig. 5.—Foundations for the New Machines.

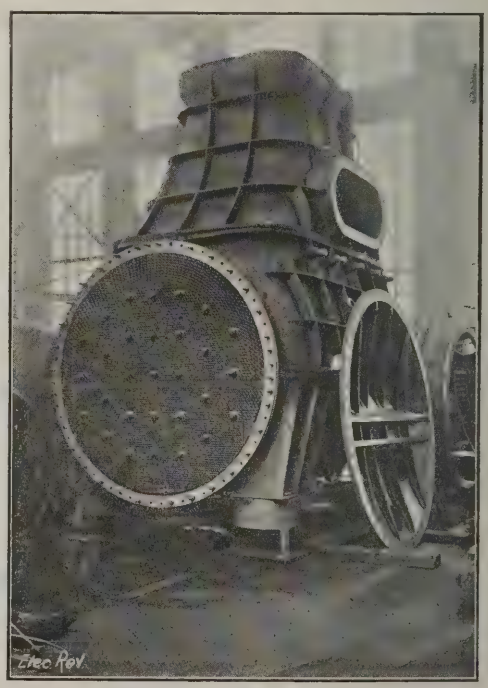

Fig. 6.—One of the Twin Condensers.

The stator casing was cast in one piece; no "through" core bolts have been used, and the "tunnel" formation of stator slot has been employed. The core conductors are made of Parsons helically-stranded coreless cable, the individual wires being in-

sulated and spiralled in a definite lay to reduce eddy currents. Thermocouples were embedded during construction. The rotor was machined from a solid forging, and a hole was trepanned axially through the centre of the shaft to enable the forging to be examined by means of optical instruments. Cool air is admitted along the whole length of the stator on the closed-circuit system of forced ventilation, using a surface air cooler and a separate motor-driven fan.

The twin Cole, Marchent & Morley condensers, one of which is shown in fig. 6, have a cooling surface of 35,000 sq. ft., are interconnected, and the water circulates through the tubes twice, the total quantity being 1,770,000 gallons per hour. Expansion stress is relieved by spring supports under the condensers' feet, and a balance pipe connects the two adapting pieces of the exhaust branches; this pipe is steam-jacketed to ensure that its expansion will be equal to that of the turbine.

Each of the three sets of C.M. & M.-Delas air extractors, two of which suffice for full-load duty, will deal with 120 lb. of air per hour with a steam consumption of 1,000 lb. per hour. Air is extracted from both sides of each condenser shell; the two-stage extractors have convergent-parallel water-jacketed diffuser tubes. Each of the two Mather & Platt condensate extraction pumps suffices for full-load duty; one is driven by a 30-h.p. d.c. motor and the other by an a.c. motor.

The evaporative capacity of the 27 water-tube boilers now in use is 676,000 lb. per hour. The 1923 boiler-house extension contains four Babcock & Wilcox marine type water-tube boilers, each of a maximum evaporative capacity of 81,000 lb. per hour.

(To be concluded.)

Ald. Wilfred Taylor presided over the proceedings generally as the chairman in office during the period of construction of the new set, which has been on load, as a matter of fact, since September. Miss M. D. Turner, daughter of Alderman Turner, presented bouquets to Mrs. Ashley and to the Lady Mayoress of Bradford (Mrs. J. Stringer).

At the Town Hall luncheon Ald. Turner again presided, and Mrs. Ashley was presented, on behalf of the three principal contractors, with a handsome table lamp of beaten silver.

Lt.-Col. Ashley, M.P., Minister of Transport, toasting "The City and Trade of Bradford," asked all manufacturers to support the British Industries Fair. The Lord Mayor of Bradford (Alderman J. Stringer) responded.

Sir John Snell, C.B.E., proposing "The Bradford Electricity Undertaking," said it was gratifying to note that in a time of industrial depression the undertaking was able to manufacture and sell at an average price of little more than 1½d. per kWh. In spite of the fact that the engineer had been handicapped to some extent by the lower steam pressure of older days, the undertaking had been able to maintain an annual thermal efficiency of some 16 per cent., whilst at the best station in the country the thermal efficiency was a little under 20 per cent. At the present moment the average consumption from public utility undertakings per head of population was only some 125 kWh per annum, whereas the sales in Bradford were already about 240 kWh, and the day was near when Bradford would have to consider going further afield in order to have the necessary generating plant to meet the needs of its own citizens. In the efforts for re-organisation in the Aire and Calder Electricity District of West Yorkshire, settlement had not been reached, and he could not help thinking that, had all the authorities concerned shown the same statesmanship and breadth of view as those connected with the Bradford undertaking, that settlement would, in fact, have been reached before now. "I ask again," said the speaker, "at this public opportunity afforded me, all of those parties to whom I have referred, to endeavour once more to come together."

Alderman Wilfred Turner, responding, said that the installation which had been started that day must not be regarded as a sign of latter-day repentance for past misdeeds in Bradford. Three large sets now housed in No. 3 engine room were actually approved by the Bradford Electricity Committee nearly 10 years ago, but war-time difficulties of obtaining plant and difficulties in arranging the removal of older plant without interrupting the continuity of supply had caused the delay.

"The Guests" were toasted by the chairman, and the Lord Mayor of Leeds (Councillor J. Arnott) and the Mayor of Huddersfield (Alderman Law Taylor) responded.

A toast to the "Contractors" was given by Councillor J. W. Longley, chairman of the Bradford Electricity Committee.

Mr. V. Watlington (English Electric Co.), Mr. G. Bedford (C. A. Parsons & Co., Ltd.), and Mr. R. S. Brailsford (Cole, Marchent & Morley, Ltd.) responded.

Councillor J. H. Palin, M.P. (ex-Lord Mayor of Bradford), proposing a toast to the Bradford City Engineer and his staff, presented Mr. T. Roles with a silver salver, the gift of the contractors, in appreciation of their happy association.

Mr. Roles, responding, paid a tribute to the way in which Mr. Townley, the deputy engineer, had carried on during his (Mr. Roles's) illness.

Radio Notes.

(Continued from page 858.)

Hungary.—REGULATIONS.—Possession of wireless receiving sets in Hungary has now been legalised, and regulations governing their use have been issued, says *The Times*.

Sweden.—INTERCONNECTION OF STATIONS.—The Government and private broadcasting stations in Sweden are all now being connected together to the main station in Stockholm, *via* underground or aerial wires. At Stockholm there are amplifiers on each main route, and there are intermediate amplifiers at Ange and Norrköping. To prevent the stations nearest Stockholm taking too much of the power from the lines to the detriment of the stations further away, adjustable resistances are inserted in the feed to each station just before the local amplifiers in the station. The line between Stockholm and Boden is 1,000 kilometres long, in which at present one amplifier suffices, but additional ones will be required when the station at Umea and other projected stations are added. Some 40,000 licences were issued in 1924; 110,000 were issued up to September 30th, 1925.

Switzerland.—SECRET BROADCASTING.—By order of the Swiss Federal Post and Telegraph Department, the Geneva police have recently seized the wireless receiving set of a Geneva individual who had failed to register his set and to pay the yearly 10-fr. tax, says *The Times*. According to the Swiss regulations, which compel amateurs to register their sets and to pay a tax, and which forbid them to write down what they hear, a fine may be imposed up to 1,000 fr. The Swiss police have also seized ten secret broadcasting posts set up by a secret association of young men for corresponding between themselves in Switzerland and with foreign countries.

Spain.—WAVE-LENGTH.—The fresh distribution of wave-lengths among the Madrid wireless companies in order to avoid complaints of mutual interference is again being considered. The monopoly project cherished by different emitting companies at Madrid and in the provinces seemed a little while ago to have been dropped; the scheme has now been revived, but is meeting with strong opposition.—*Reuter's Trade Service* (Madrid).

United States.—RADIO INDUSTRY.—The receipts of the United States wireless industry for 1925 are expected to exceed $500,000,000 (£100,000,000), which would be an advance of $200,000,000 over last year's figures. The increase within five years from the $6,000,000 (£1,200,000) of 1920 marks a "record" expansion for any American business. The manufacturers estimate that in 1925 they will have sold 3,000,000 wireless sets and 20,000,000 valves, as well as $150,000,000 (£30,000,000) worth of parts and accessories for home-made sets and replacements. According to Major H. H. Frost, president of the Radio Manufacturers' Association, the industry now employs about 300,000 persons in 1,200 factories and 40,000 workshops. Out of 584 existing broadcasting stations, 108 are operated by educational institutions, 47 by churches, and 39 by newspapers.—*The Times*.

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Ashford.—December 14th. Electricity Department. Concrete engine foundations, concrete cooling pond, reinforced concrete road, steam and small electric circulating water pump, fuel-oil pump, oil-purifying plant, fuel-oil storage tanks, &c. (See this issue.)

Australia.—SYDNEY.—February 1st. Municipal Council. Bunnerong power house equipment. Six 25,000-kW turbo-alternators, 18 100,000 lb. per hour boilers, &c., and 33,000-V switchgear. (November 13th.)

MELBOURNE.—April 12th. State Electricity Commission of Victoria. Plant for the Sugarloaf and Rubicon hydro-electric scheme, consisting of turbo-generators, transformers, switchgear, cranes, and accessory plant. The Secretary, 22-32, William Street, Melbourne.*

Victorian State Railways. January 20th, 1926. Automatic battery charging equipment.* January 13th. Double recording wattmeter.*

Banff.—December 14th. Town Council. Electrical work in connection with the new Town Hall. Specifications from Town Clerk.

Belgium.—December 2nd. Belgian Post and Telegraph authorities, La Salle Madeleine, Brussels. Supplying and laying telephone cables at Ostend, La Panne, and Knocke. Particulars (Cahier des Charges Special No. 3-159) for 5 fr.

Bridlington.—December 7th. Electricity Department. One oil engine, direct coupled to a 275-kW d.c. generator, fuel storage tank, cooling tower, pipework, and pumps. (November 13th.)

Cork.—Public Works Department, Dublin. Installation of electric lighting in the Munster Institute, Cork. Mr. J. J. Healy, secretary.

Dublin.—December 10th. Great Southern Railways Co. Stores for six months, including electric lamps, &c. Stores Superintendent, Inchicore, Dublin.

Egypt.—December 30th. Inspecting Engineer in London, Queen Anne's Chambers, S.W. Telegraph and telephone material and motor generator and telegraph apparatus.

ALEXANDRIA.—December 10th. Ministry of the Interior. Machinery in connection with the waterworks scheme at Mellawi, consisting of electric motors and centrifugal pumps, control panels, l.p. armoured cable, &c. (C.X. 1,796.)*

Exeter.—December 11th. Electricity Department. One 3,000-kW steam turbo-alternator and accessories. (November 20th.)

Glasgow.—December 4th. Corporation Health Department. Electric lighting installation and heating works in connection with the alterations and extensions to Mount Blow Home, Dalmuir. Specifications from Office of Public Works, City Chambers.

London.—METROPOLITAN ASYLUMS BOARD.—December 2nd. Renewal of electric cables, &c., at the Brook (Fever) Hospital, Shooters Hill, Woolwich, S.E. (November 13th.)

ISLINGTON.—December 17th. Electricity Committee. One 75-kW a.c. motor and d.c. generator, with starters, switchgear, &c., and three 5,000-kVA Scott-connected transformers, &c. (November 20th.)

H.M. OFFICE OF WORKS.—December 3rd. Electrical accessories. (November 20th.)

Manchester.—December 8th. Tramways Committee. Permanent-way special trackwork. Specifications from Mr. H. Mattinson, general manager and chief engineer, 55, Piccadilly, Manchester.

Marlborough.—Borough Council. Conversion of 62 street lamps from gas to electricity, including connecting up to existing mains. (November 20th.)

New Zealand.—WELLINGTON.—January 19th, 1926. Public Works Department. 50,000- and 110,000-V switchgear and steelwork for the Waikato electric power scheme. (B.X. 2,157.)*

January 26th. 50,000-V switchgear for the Waikato electric power scheme; transformers for the Lake Coleridge power scheme.*

GISBORNE.—Borough Council. Diesel engine, alternators, and auxiliary plant, rotary converter, and switchboard. (November 13th.)

Normanton.—November 30th. Urban District Council. Electric wiring of houses, Snydale Road. Specifications from Mr. J. Hepton, electrician, Council Offices.

Oldham.—December 5th. Electricity Department. Eight water-tube boilers, with superheaters, chain-grate stokers, steel chimneys, and induced draught plant. (November 6th.)

Peterborough.—November 30th. Electricity Department. Buildings and civil engineering work, pulverised fuel equipment, two boilers and boiler-house equipment, one 6,000-kW turbo-alternator and turbine-room equipment, e.h.p. and l.p. switchgear, &c. (November 13th.)

South Africa.—JOHANNESBURG.—December 14th. Electricity Supply Commission. Plant and material for transmission lines and sub-stations in connection with the supply of electricity in the Cape area rural districts.*

December 23rd. Union Tender Board. Telephone apparatus and supply of telegraph material for the Department of Posts and Telegraphs.*

December 17th. Municipal Council. 2,000-kW motor converter. (B.X. 2,142.)*

CAPE TOWN.—December 3rd. Electricity Department. Substation plant and transmission lines. (B.X. 2,139.)*

Thornton.—December 13th. Urban District Council Electricity Department. Supplying, laying, jointing, and coupling-up complete of an electricity supply system. (November 20th.)

Uruguay.—MONTEVIDEO.—January 29th. State Electricity Supply Works. Fuse wire, enamelled lamp shades, cut-outs, switches, lampholders, sockets, &c. (B.X. 2,126.)*

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Durham.—County Council. Accepted:—
Installation of electricity at Ryhope police station.—Maggs & Gordon.
Electrical installations at schools:—Haswell elementary (£184); Horden (£84); and Shotton (£283).—Simm & Richardson. South Hetton (£170).—Reid, Ferens & Co.
Departmental telephones (£126).—Devereux, Mordee & Co.

Dorchester.—Electricity Committee. Recommended:—
Supplying and laying cable, Victoria Park district (£561).—Johnson and Phillips, Ltd.

Exeter.—Tramways Committee. Accepted:—
Four tramcars (£7,374).—Brush Electrical Engineering Co., Ltd.

Government Contracts.—The following Government contracts were placed during October, 1925:—

ADMIRALTY, CONTRACT AND PURCHASE DEPARTMENT.
Battery spares.—Hart Accumulator Co., Ltd.
Condenser boxes.—Automatic Telephone Mfg. Co., Ltd.
Junction boxes.—Hawkers, Ltd.
Junction and distribution boxes.—Park Royal Engineering Co., Ltd.
Cells.—London Battery & Cable Co., Ltd.
Electric travelling crane.—Cowans, Sheldon & Co., Ltd.
W./t. heterodyne units.—H. W. Sullivan, Ltd
Lamp fittings.—W. McGeoch & Co., Ltd.; Fairless Engineering Supplies Co., Ltd.
Motor generators.—Newton Bros. (Derby), Ltd.
Motors and control gear.—F. & A. Parkinson, Ltd.
Terminal panels.—Park Royal Engineering Co., Ltd.

WAR OFFICE.
Secondary batteries.—Pritchett & Gold and E. P. S. Co., Ltd.
Electric cable.—Callender's Cable & Construction Co., Ltd.
Electric cells.—Edison Swan Electric Co., Ltd.
Secondary station cells.—Chloride Electrical Storage Co., Ltd.
Conduit and fittings.—Barton & Sons, Ltd.
Copper sheet.—British Insulated & Helsby Cables, Ltd.; H. H. Vivian and Co., Ltd.
Ebonite.—Hightensite & Ebonite Mfg. Co., Ltd.
Electric lighting fittings.—Cable Accessories Co., Ltd.
Generators.—Small Electric Motors, Ltd.
Power units.—Douglas Motors, Ltd.
Switchboards.—General Electric Co., Ltd.
W./t. valves.—British Thomson-Houston Co., Ltd.; Edison Swan Electric Co., Ltd.; General Electric Co., Ltd.

Train-lighting equipment.—J. Stone & Co., Ltd
Switchgear.—English Electric Co., Ltd.
Ironclad switchgear.—Metropolitan-Vickers Electrical Export Co., Ltd.
Telegraph and telephone materials, &c.—Siemens Bros. & Co., Ltd.
Telephone switchboard.—British L. M. Ericsson Mfg. Co., Ltd.
Train control apparatus.—Western Electric Co., Ltd.

Hull.—Electricity Committee. Accepted:—
Three engines and exciter (£650).—Marple & Gillott, Ltd.

London.—CLAPHAM.—L.C.C. Education Committee. Installation of electric lighting at New Road school, Clapham:—

Commercial Telephone & Electrical Co., Ltd. (Recommended.)	**£528**
Smethurst & Co. (London), Ltd.	532
Bailey & Incledon	534
R. Langston-Jones & Co.	573
A. Hawkins & Sons	595
J. Biggs	610
J. Brent & Co., Ltd.	685
Burdette & Co., Ltd.	687

Maidenhead.—Board of Guardians. Accepted:—
Installing electric lighting in the sick wards at the Institution.—S. Evans and Co.

Northampton.—Howden-Ljungström Preheaters (Land), Ltd., has received an order from the Stirling Boiler Co., Ltd., for two large preheaters to work in conjunction with two 50,000-lb. boilers to be installed at the Northampton Electric Light and Power Co.'s station.

Preston.—Finance and General Purposes Committee. Accepted:—
Electrical winding apparatus for Town Hall clock, including overhauling and repair (£306).—W. Potts & Sons, Ltd.

South Shields.—Reporting on the purchase of foreign meters, the electrical engineer states that he has obtained a quotation from Messrs. Robert Hornby & Co., Ltd., the London agents for a Continental firm, from which it appears that in sizes up to 15 amperes he can purchase at 12s. per meter cheaper, and in the larger size of 20 amperes 19s. cheaper than is at present being paid. The question of the purchase of foreign meters is to be discussed at the next meeting of the Electricity Committee.

Tynemouth.—Electricity Committee. Accepted:—
Cable.—Hackbridge Cable Co., Ltd., and Macintosh Cable Co., Ltd.

West Saltney.—Council. Accepted:—
50 lamp standards (£181).—W. Lucy & Co., Ltd.

Winchester.—We are informed that the amount of the accepted tender of Messrs. Babcock & Wilcox, Ltd., for boiler plant for the Corporation Electricity Department is £4,964, not £5,188 as stated in our issue of November 20th.

Forthcoming Events.

Royal Society of Arts.—Monday, November 30th. At John Street, Adelphi, W.C. At 8 p.m. Cantor Lecture, "Coal Ash and Clean Coal," by Dr. R. Lessing. (Lecture II.)

British Electrical Development Association (North-Eastern Area Sub-Committee).—SECOND CONFERENCE.—Monday, November 30th. At Messrs. Sopwith's Lounge, Northumberland Street, Newcastle-on-Tyne. Discussion on "The Possibilities of To-day," to be opened by Mr. A. Albrecht.

Institution of Civil Engineers.—Tuesday, December 1st. At the Institution, Great George Street, S.W. At 6 p.m. Paper on "Trafford Wharf Reconstruction at the Manchester Docks," by Mr. H. A. Reed.

Electrical Society of Glasgow.—Tuesday, December 1st. Paper on "Wiring Systems," by Mr. T. S. Seymour.

National Association of Supervising Electricians.—Tuesday, December 1st. At the Junior Institution of Engineers, 39, Victoria Street, S.W. At 7.15 p.m. Lecture on "Electric Time Service," by Mr. F. Hope-Jones.

Roentgen Society.—Tuesday, December 1st. At 32, Welbeck Street, W. At 8.15 p.m. Ordinary scientific meeting.

Edinburgh Electrical Society.—Wednesday, December 2nd. At the Royal Scottish Society of Art, 117, George Street. At 8 p.m. Discussion night.

Institution of Electrical Engineers.—Thursday, December 3rd. At the Institution, Victoria Embankment, W.C. At 6 p.m. Paper on "An All-Electric House," by Prof. S. P. Smith.

(North-Western Centre).—Tuesday, December 1st. At the Engineers' Club, Manchester. At 7 p.m. Lecture on "The Engineer: His Due and His Duty in Life," by Mr. T. Carter.

(South Midland Centre).—Wednesday, December 2nd. At the University, Birmingham. At 7 p.m. Paper on "An All-Electric House," by Prof. S. P. Smith.

(Western Centre).—Monday, December 30th. At the South Wales Institute of Engineers, Cardiff. At 6 p.m. Lecture on "Switchgear Developments during the Past 20 Years," by Mr. J. H. Thomas.

(Scottish Centre).—Wednesday, December 2nd. At the Grosvenor Restaurant, Glasgow. Annual dinner.

(Wireless Section).—Wednesday, December 2nd. At the Institution, Victoria Embankment. At 6 p.m. Paper on "The Performance of Amplifiers," by Mr. H. A. Thomas.

Junior Institution of Engineers.—Friday, December 4th. At 39, Victoria Street, S.W. At 7.30 p.m. Lecturette, "Super Heterodyne Reception," by Mr. A. E. Bowyer-Lowe.

Association of Mining Electrical Engineers (Western District Sub-Branch).—Saturday, December 5th. At 62, Wind Street, Swansea. Paper, "A Review of the Mines Electricity Acts," by Mr. W. J. Charlton.

Institution of Engineers-in-Charge.—Wednesday, December 9th. At St. Bride's Institute, Bride Lane, E.C. At 7.30 p.m. Paper on "Oil Fuel for Commercial Purposes," by Mr. H. G. Burford.

The "Electrical Review" Service Department.

INQUIRIES must be accompanied by a stamped addressed envelope.

We should be glad to learn the names of makers or suppliers of:—

The "FRANKA" Vacuum Cleaner.
The "KAPLAN" Turbine (British makers only).

Notes.

B.E.S.A. Specification.—To the British Engineering Standards Association specification for tungsten filament electric lamps (No. 161) have been added three new schedules: Normal vacuum train lighting lamps, gasfilled train lighting lamps, and traction vacuum type lamps (series burning). The adoption of these schedules by those responsible for train and tramcar lighting will reduce the variety of types of lamps used for this purpose, and do away with the large number of differing pressures for which these lamps have had to be made in the past. The schedules, copies of which may be obtained from the B.E.S.A. Publications Department, 28, Victoria Street, London, S.W.1, will be included in loose pamphlet form in B.S.S. 161, until that document is revised, when they will be incorporated. The new edition is expected to be ready early in the New Year.

Electrical Association for Women.—We are interested to learn that the inauguration of the Glasgow and District Branch of the above Association, on November 19th, was a success. The Corporation of Glasgow and the Electricity Committee gave the Branch Association every support, including the use of the City Chambers for the inaugural meeting, and the Corporations of Greenock and Paisley also co-operated. Lady Belhaven, the first president of the branch, said that electricity was, or ought to be, in this country the poor man's servant, but though it was cheap once it was installed, there was considerable initial expenditure, which was beyond the poor man's purse. They were, however, only at the very beginning of the things that electricity could do. The origin and work of the Association were explained by Miss C. Haslett. Mrs. Sadler, widow of ex-Bailie Sadler, was appointed hon. treasurer of the branch, with Miss K. F. Kennedy as hon. secretary.

Scott's Old Boys' Association.—The annual dinner of the above Association was held on Saturday last at the Engineers' Club, London, with Mr. C. Newton Russell in the chair. There was a good gathering of "Old Boys," as it was a special meeting, the guest being Mr. Howard Marryat, who is one of the oldest of the "Old Boys," and has hitherto played the greatest part in keeping them together. After dinner the Chairman, in proposing the health of Mr. Marryat and the thanks of the Association to him for his indefatigable work in keeping the "Old Boys" in touch with each other, presented him with a framed testimonial and photograph of the old works and boys, and a case of pipes.

The Association is desirous of obtaining the names and addresses of some of the "Old Boys" who have been out of touch for some years, and if this notice reaches any of them, they are asked to communicate with Mr. Howard Marryat, of 28, Hatton Garden, E.C.1, who will see that in future they shall have invitations to the annual dinner, &c.

Midland Electrical Engineers' Ball.—This very popular and well-attended function which has now become a permanent annual fixture was held at the Grand Hotel, Birmingham, on Friday evening, November 20th, Mr. W. H. Heaton acting as chairman.

Mr. R. A. Chattock, this year's President of the Institution, appeared to be enjoying himself as much as he always does, with Mr. W. B. Woodhouse as a good second, and among those from far afield we had the pleasure of meeting Mr. Salt, of Carlisle and Mr. Bexon, of Kilmarnock.

Mr. Harry Lawson displayed even more agility than usual and if, perchance, he were to forsake engineering (which the gods forbid), he would undoubtedly find a place in any troupe of Russian dancers.

Over 400 were present, the Corporation and company engineers being particularly well represented, as were also the great Midland electrical engineering concerns, and as everyone seemed to know everyone else the evening was, as is always the case at Birmingham, a thoroughly cheery one.

The popular and indefatigable Mr. W. Y. Anderson and his executive colleagues may congratulate themselves most heartily on the complete success of all the arrangements which had been made, and we are sure that all those present would wish to thank them for the weeks of toil which must have been necessary to bring about such perfect staff work. We look forward to next year.

Prize Award.—FONDATION GEORGE MONTEFIORE.—The Triennial Prize of this Trust has been divided by the jury of experts, into four parts. The first, comprising 6,000 francs, has been awarded to Mr. F. Creedy, of London, for his two papers entitled "Some Developments in Multi-speed Cascade Induction Motors" and "Variable Speed Alternating-current Motors without Commutators"; the second, of 4,000 francs, to Professor J. B. Whitehead, of Baltimore, for his paper "Gaseous Ionisation in Built-up Insulation"; the third, of 4,000 francs, to Mr. Chechelowsky, of Antwerp, for his paper "Study on Operating and Releasing Times of Telephone Relays"; and the fourth, an additional prize of 2,000 francs, to Mr. Raymond Wilmotte, of London, for a paper on "Une Nouvelle Forme de Transformateur."

The President announced that the next competition would take place in 1927 and that the prize fund would amount to 20,500 francs.

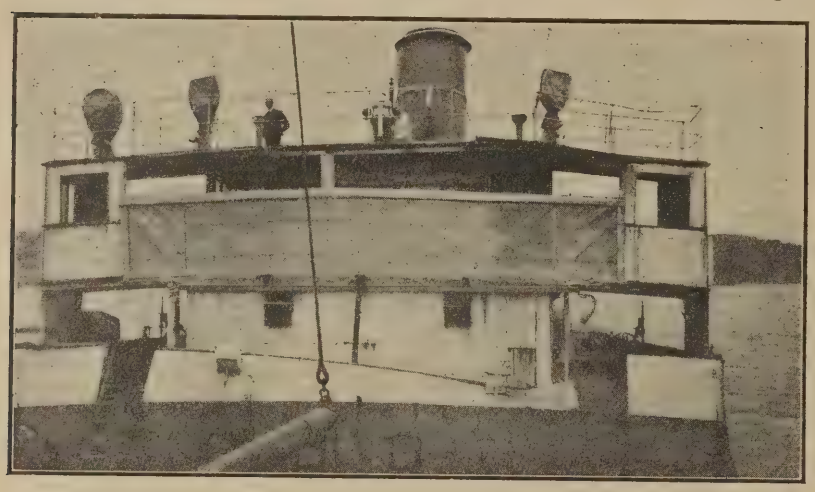
Local Society.—EDINBURGH ELECTRICAL SOCIETY.—Members of the Society on November 18th heard a most interesting lecture on accumulators, the title being "Stationary Batteries for Country House Lighting and Power Station Work," by Mr. E. C. Mackinnon, M.I.E.E. (Chloride Co.). Lantern slides were shown and a very interesting evening was spent. Mr. J. G. Burchell, president of the Society, occupied the chair, 30 members being present.

Electrical Vehicles in Italy.—Notwithstanding the increasing vogue of petrol vehicles in Italy, it is interesting to learn that the postal transport work in Turin is done by a contracting firm which employs a fleet of about 40 electric vans for the work. The Società Italiana de Veicoli Elettrici has a large fleet of electric taxicabs in service in Milan, while a company is also running a number of single-deck electric 'buses in Rome.

Appointments Vacant.—Foreman electrician (£450) for the Air Ministry Works and Buildings Department, Iraq. Assistant switchboard attendant (74s. 3d.) for the Leyton U.D.C. Electricity Works. Draughtsman (temporary) (110s.), for the Battersea Borough Council Electricity Department. (See our advertisement pages to-day.)

Fatality.—While four men were erecting a wireless pole and aerial in a garden at Havercroft, near Barnsley, recently, the pole swayed and fell on to the wires belonging to the Yorkshire Electric Power Co., which convey power from Thornhill to the New Monckton Collieries. The aerial came in contact with a live wire, and Harrison Milburn (27), a foreman at the collieries, received such a shock that he died instantly. Two of the other men incurred shock and were slightly injured. At the inquest a verdict of "Death from misadventure" was returned. An official of the power company stated that the voltage upon the line was 11,000 volts.

Attempt to Blow up Electric Cable.—An attempt, by shale-oil strikers, it is believed, says the *Manchester Guardian*, was made during the night of November 20th-21st to blow up a main electric cable from Roman Camp, which supplies power to the works of the Scottish Oil Co. at Broxburn, Uphall, and Middleton, and other pits. Gelignite was exploded under the cable only a few yards from the main Edinburgh to Bathgate railway. Much damage was done, but the perpetrators failed in their chief purpose, and they only succeeded in cutting a branch cable supplying power for the pumps in the Loaninghill mine.



A Cable Ship's Ordeal. — With her decks presenting a scene of chaos and her after holds filled with water, the cable ship *Lord Kelvin* entered Queenstown Harbour on the morning of November 10th after a severe ordeal in mid-Atlantic during a gale, as has already been reported in our pages.

In an interview with a *Journal of Commerce* correspondent, one of the officers said that when the majority of the crew were asleep late at night on November 6th, a wave struck them broadside, carrying everything in its path overboard. "We thought the ship was about to sink, and an S.O.S. signal was sent out. Previously we had picked up signals of distress from six other vessels the same night. All the boats had been smashed or washed overboard, the engine-room telegraphs and other deck fittings were torn away and carried overboard, the forward bridge superstructure was washed away, the tops of the tank hatches were stove in and the holds flooded, and the saloon was badly buckled. All the lights had been put out of action owing to the inrush of water in the engine-room, which damaged the dynamos. During the darkness we almost collided with two ships that were coming to our aid, and only by lighting flares could we make our presence known. We managed to get the ship around and run before the gale.

"During the height of the storm several large buoys, weighing about a ton each, became loosened on the foredeck, and Mr. Foote, the chief officer, volunteered, with a number of men, to secure them. While this dangerous task was being accomplished, Mr. Foote was caught by a big wave, and was going over the side when a member of the crew grabbed him by his clothes and pulled him back again. Several of the crew received injuries, but none was seriously injured.

"Orders for the engine-room from the bridge had to be conveyed by relays of men transmitting the verbal instructions from one to the other."

The accompanying illustrations, for which we are indebted to Mr. A. N. C. Horne, of Queenstown, show some of the damage caused; note the temporary repairs to the bridge, a large portion of which was broken in.

The Cable Ship "Lord Kelvin"; Damage Caused in Recent Gale at Sea.

A New Type of Radiation.—It is reported that Dr. R. A. Millikan, director of the Physics Laboratory of the California Institute of Technology, has discovered a type of high-frequency radiation of very great penetration, having a wave-length only one-fiftieth of that of the shortest rays previously known—about one ten-millionth of that of light rays. The existence of such rays has been suspected for many years. Dr. Millikan, whose scientific achievements compel respect for his statements, identified the rays by sending balloons up to a height of nearly ten miles, carrying recording electroscopes, and by experiments on Mount Whitney at a height of 11,800 feet, where he found that the rays could penetrate the equivalent of 68 feet of water or 6 feet of lead before complete absorption. He believes that they are produced by nuclear transformations enormously more energetic than those involved in the radioactive changes that are already known, and that they reach the earth at all hours of the day and night with equal intensity.

Parliamentary.—On November 19th, Mr. Albery asked the Home Secretary whether there was any independent periodic inspection of water reservoirs or electric power dams; and, if so, by whom. Sir W. Joynson-Hicks said that accidents due to the bursting of such reservoirs or dams had fortunately been very rare and so far, at any rate, as general legislation was concerned, no provision had been made for any independent periodic inspection of such works.

Road Authorities and Mains.—A Committee of the House of Lords, on November 19th and 20th, heard an application by the Northamptonshire County Council for the insertion of special protective clauses in an Order proposed to be granted by the Board of Trade to the Northampton Gas Light Co. The main provision asked for by the County Council was to the effect that if it was carrying out improvements to roads, and it was found necessary to alter the position of the gas company's mains, the cost should be borne by the company. The general law was that the cost of moving mains must be borne by the authority carrying out the improvements.

On behalf of the County Council it was stated that the provisions of the general law were passed at a time when roads were not subjected to the heavy traffic which they had to bear at present, and road construction methods were quite different; therefore, the general law was inadequate to meet present-day conditions. On behalf of the gas company, however, it was contended that if there were to be an alteration of the existing law, it should be effected by general legislation, applicable to all gas undertakings, and not to one particular company.

It was mentioned that representatives of public utility undertakers—gas, water, electricity, &c.—were at present conferring with the County Councils' Association and representatives of other highway authorities in an endeavour to agree upon conditions with respect to the laying of mains which should apply generally throughout the country, and should be embodied in a general Act. It was pointed out that a decision by the Committee might prejudice the work of the conference and it was suggested that the Gas Company's Order should be held up, pending a decision of the conference. The Gas Company, however, would not assent to this course.

Subsequently, the County Council asked the Committee to insert a protective clause similar to one inserted in an Act of the Sunderland & South Shields Water Co., in 1921, by a Committee of the House of Lords, which contained the provision now sought. Further, the Council offered to undertake that, if and when the conference referred to produced a clause applicable to public utility companies generally, it would substitute that clause for the Sunderland clause. It was stated on behalf of the Gas Company that the clause in the Sunderland Act was inserted in view of special circumstances.

The Committee decided not to grant the County Council the protection asked for.

The Severn Barrage Scheme.—On November 23rd, Colonel Woodcock asked the President of the Board of Trade if it was his intention to proceed further with the Severn tidal power scheme inquiry, in view of the fact that the city of Bristol was proposing to spend about £1,000,000 in the erection of a power station in close proximity to the River Severn to serve Bristol and part of the surrounding district.

Sir Burton Chadwick said that the practicability of the Severn Barrage scheme had been referred to the Committee of Civil Research, which had appointed a special sub-committee to advise on the whole question. Any local electrical developments would no doubt be brought to the notice of the sub-committee by the Departments immediately concerned.

Welsh Dam Burst.—Inquest Postponed.—The inquest upon the bodies of the victims of the recent North Wales dam burst has been further adjourned until December 2nd. It has been decided to hold it at Conway, as most of the inhabitants of Dolgarrog are employés of the Aluminium Corporation or dependants of employés.

The Public Works and Roads Exhibition.—That the activities of local Government service grows more diverse and important each year was clearly indicated by the Public Works, Roads and Transport Congress and Exhibition (November 19th to 26th) which is held biennially at the Royal Agricultural Hall, London. The present show was the third of the series, and some 720 authorities nominated 1,315 delegates to the Congress, which considered, amongst other things, "The Uses of Electricity for Housing and Institutional Purposes" (paper by Mr. R. Hardie, Glasgow, arranged by the I.M.E.A.) and the "Repair of Roads Against Tramway Track" (paper by Mr. F. Wood).

The Agricultural Hall has been re-lighted, the installation having been carried out by Messrs. Jacob, White & Co., Ltd. The overhead fittings (Lighting Equipment Co., Ltd., St. Albans) employed are of the "Trent" pattern with prismatic band refractors, and gasfilled lamps, sprayed one-third of the way up, have been used to eliminate any glare that might arise from the low position of the filaments in the refractors. The "Goliath" porcelain holders are carried by anti-vibration disks, and there are six rows of 13 lamps. The area illuminated is 312 ft. by 125 ft., which was originally lighted by 35 10-amp. flame arcs, consuming 19 kW; with the new 300-watt gasfilled lamps the consumption is 23.4 kW.

Amongst the exhibits Messrs. Walker Vehicles, Ltd., had a "balanced drive" electric tractor on view, which should be of use to municipalities on account of its versatility. On the stand of Messrs. Hadfields, Ltd., tramway materials included car wheels which had tires secured by the firm's "lock-fast" method, whilst Messrs. Richard Hill & Co., Ltd., showed electrically-welded fabric for reinforcement in road construction.

Amongst the air compressors shown by Messrs. Reavell and Co., Ltd., was a portable set intended for tramway repair work; it is run from the overhead trolley wire, and is of sufficient capacity to operate a concrete breaker on heavy work, the motor being totally-enclosed and the compressor air cooled so that no water circulation is needed. The exhibit of the Horstmann Gear Co., Ltd., comprised an extensive range of automatic lighting appliances for street lamps; Newbridge time switches are made in a variety of types for from 1.5 to 50 amperes and with 8- to 45-day clocks. The Hackney Borough Council is fitting type E/B/I time switches to all lamps in its area.

The Sullivan Machinery Co.'s electric hoists and haulage gear combine light weight and portability; ball bearings are employed, and the whole of the mechanism, including the driving motor, is contained within the drum itself. The road materials displayed by W. Shepherd & Sons, Ltd., included parging blocks for paving tramway margins; they are 9 in. long and made of brickware, so shaped as to fit the cavity at the side of the rails and afford a solid vertical paving face. Their use is claimed to obviate the necessity for filling the rail cavities with cement grout, &c. Weldless steel tramway, power transmission, and telegraph poles were shown by Messrs. Bromford, Ltd., besides superheater tubes, steam mains, &c.

The Jackson Electric Stove Co., Ltd., was also exhibiting, and in conclusion it may be stated that about 176 firms displayed their products in some 82,820 sq. ft. of space.

Educational.—We have received a copy of the annual report for the 129th (1924-25) session of the Royal Technical College, Glasgow. The total number of students in attendance during the session is shown as 4,753, as compared with 4,816 for the previous year. The statement of accounts for the year shows an expenditure of £72,545, resulting in a deficit at the end of the year of £1,873. The plant in the electrical engineering workshop has been thoroughly overhauled, new machine tools have been acquired, and a line of shafting has been installed. Special evening courses were given during the year in technical radiology, wireless telegraphy and telephony, and electrical machine design.

Institution Notes.

Institution of Electrical Engineers.—Sheffield Sub-Centre.—In a recent paper, Mr. A. R. Cooper, a student member, said that the application of electro-pneumatic machinery to colliery safety requirements was worth the investigation of every colliery engineer; identical units had been in use for many years on the Underground and on the biggest railways in the world. The process of delivering the full tubs and filling the cage again with empty ones involved many subsidiary operations, particularly in the case of an upcast shaft where airlocks had to be used. In the electro-pneumatic system all those operations had been smoothed out into an ordianry cycle in which everything was so interlocked that the possibility of accidents or mishaps was reduced to an absolute minimum, and the whole system was under the control of a master switch which could stop further progress at any point of the cycle. With lantern slides to illustrate his descriptions, Mr. Cooper dealt in detail with the apparatus, concluding with a description of the installation at the Silverwood Colliery, near Rotherham.

Illuminating Engineering Society.—At the opening meeting of the Society on November 26th, at the Royal Society of Arts, reports on progress during the vacation and developments in lamp and lighting appliances were to be presented, and some interesting novelties, including new forms of lighting fittings, the "Mutochrome" colour projector, artificial daylight, new photometric apparatus, &c., were to be shown.

Diesel Engine Users' Association.—Oil Engine Working Costs.—At the November meeting, the Association considered a report which had been prepared by the Committee on the subject of heavy-oil engine working costs for 1924-25, which forms the fourth of the annual series. The average total engine cost of 36 home stations with a total output of over 32,000,000 units and with an average annual plant load factor of 15.3 per cent. was 0.806d. per unit generated for the year 1924-25. The improvement in this figure, as compared with the average figure of 0.899d. per unit generated for the year 1923-24, is largely accounted for by the reduction in the maintenance cost. The average total engine cost for eight overseas stations with a total output during the year of over 18,000,000 units was 0.746d. per unit generated. Among the 44 undertakings listed in the report, 19 additional engines have been put into service, representing an increase in the installed capacity, taken over the whole of tne undertakings, of 25 per cent. Of the 19 engines put down, four are of 1,000 h.p. or upwards, four are of 750 h.p., and the average capacity of the new units installed is over 500 b.h.p.

Physical Society of London.—At the meeting held on November 13th, Mr. F. E. Smith, C.B.E., F.R.S., president, being in the chair, a vote of congratulation on the recent presentation to him of the Hughes Medal of the Royal Society was carried by acclamation. A paper entitled "Valve-Maintained Tuning Forks without Condensers" was read by Mr. T. G. Hodgkinson, A.M.I.E.E. The paper was illustrated by a demonstration. The valve-maintained tuning fork is now a much-used piece of apparatus, but the influence of the conductance of the valve electrodes on the design has not been considered. The paper discussed the design of valve-maintained tuning forks without condensers and showed that the conductance of the valve grid decided the direction in which the electrode coils must be wound; and also that it was advantageous, particularly in the case of low-frequency forks, to interpose transformers between the valve electrodes and the fork magnets.

In the discussion, Dr. W. H. Eccles said that the author had shown how account must be taken of the valve characteristics in designing the apparatus, and how to secure that the maintained frequency should be the true frequency of the fork. The latter point was particularly important when the harmonics of the fork frequency were employed: thus it was possible to utilise the twenty-ninth harmonic of a 1,000-cycle fork, giving a frequency of 60,000 cycles. In this way standards could be obtained and oscillations generated over a wide range of the wireless spectrum, at constant and accurately known frequencies. Dr. C. V. Drysdale said that stroboscopic methods of measurement had always suffered from the defect that the rate of a fork was varied by the means adopted for maintaining vibration. Dr. Eccles's invention of the valve-maintained fork was of great importance as a solution of this difficulty, and the author was to be congratulated on having put the matter on a satisfactory quantitative basis.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.)

Sir Thomas Callender, managing director of Callenders' Cable & Construction Co., Ltd., is at present in America, where he is visiting some of the latest super-power stations, and also the works of the Okonite-Callender Cable Co. at Paterson, New Jersey.

Mr. G. P. Dennis, consulting electrical engineer, of Birkenhead, has been elected a member of the Town Council.

The *Shanghai British Chamber of Commerce Journal* for October contained the following announcement:—"Mr. Donald McColl's connection with the Shanghai Electric Construction Co., Ltd., ceased on June 9th, and Mr. C. Burgess, late of the Walsall Corporation Tramways, has been appointed General Manager. Mr. R. B. Herbert has been appointed Shanghai Manager and Deputy General Manager."

Stoke Newington Borough Council Electricity Committee has received a letter from Mr. C. S. Hann (the Borough Electrical Engineer), submitting a medical certificate recommending the continuation of his treatment at Arosa for five or six months from October 13th. The Committee recommends that the four months' leave of absence previously granted to Mr. Hann be extended to six months from July 13th, 1925, on full pay, with a further three months' leave on half-pay.

Obituary.—Sir E. E. Pearson.—We regret to record that Sir Edward Ernest Pearson, a director of S. Pearson & Son, Ltd., the well-known contractors for public works, and a brother of Lord Cowdray, passed away suddenly on November 19th at the age of 51 years. He was a director of the Electric and Railway Finance Corporation.

Mr. R. Franklin.—The death took place on November 16th, at his residence at Romford, of Mr. Richard Franklin, O.B.E., a director of the Chesham Electric Light & Power Supply Co. He was 49 years of age.

Herr R. M. Friese.—The death is reported from Berlin of Herr Robert M. Friese, who was for many years director of the Siemens-Schuckert Works in Charlottenburg, and lately acted

as adviser to the central experimental department of the associated Siemens undertakings.

Mr. A. Shuttleworth.—We regret to record the death of Mr. Alfred Shuttleworth, a director and for some years chairman of Clayton & Shuttleworth, Ltd., of Lincoln, which occurred on November 22nd, at the age of 82 years.

Mr. Ernest May.—The death occurred on October 28th, of Mr. Ernest May, president of the Cie. Française des Câbles Télégraphiques. Mr. May was born in Strasburg in 1845, and served in the Franco-Prussian War. His interests were principally financial and he was connected with several banking firms. In 1879, Mr. May founded the Société Générale des Téléphones which installed the first telephone system in Paris; this company later became the Société Industrielle des Téléphones. He took a leading part in the field of submarine telegraphy and was one of the founders of the Société des Télégraphes Sous-Marins, which was affiliated in 1894 to the Société du Télégraphe de Paris to form the present Cie. Française des Câbles Télégraphiques in which Mr. May was active up to the time of his death. He participated in the formation of a number of radio companies.

Wills.—The late Mr. W. A. J. Gunther, of the firm of Wansbrough, Skelsey & Gunther, left £11,406 gross and £11,320 net personalty.

Mr. H. D. Ellis, a director of the Tottenham District Light, Heat & Power Company, left £54,196 gross and £51,092 net personalty.

New Companies Registered.

Frank A. Smith, Ltd. (209,772).—Private company. Registered November 19th. Capital, £5,000 in £1 shares. Objects: To acquire the business of a wireless engineer and manufacturer of and dealer in radio apparatus now carried on by F. A. Smith at 90, High Street, Stourbridge, and 51, Broad Street, Worcester, as "Frank A. Smith," and at Union Street, Stourbridge, as "Smith's Radio Supplies." The joint managing directors are:—F. A. Smith (chairman), Love Lane, Stourbridge; and R. W. Petley, Pedmore Lodge, Stourbridge. Qualification, £500 shares. Solicitor: P. H. Chappell, Hagley Road, Stourbridge.

H. L. Wood & Son, Ltd. (209,735).—Private company. Registered November 17th. Capital, £500 in £1 shares. Objects: To carry on the business of manufacturers of apparatus for transmitting, communicating, or receiving music, speeches, messages or other means of communication, by radio-telegraphy and telephony, &c. The first directors are:—H. L. Wood, 7, Taswell Road, Southsea, electrical engineer; and Lilian O. Wood, 7, Taswell Road, Southsea (both permanent). Qualification of other directors, 100 shares. Secretary: F. Fuller. Registered office: 36, Russell Street, Portsmouth.

Francis Lamp Locks, Ltd. (209,732.)—Private company. Registered November 17th. Capital, £20,000 in £1 shares (16,000 10 per cent. cumulative preference and 4,000 ordinary). Objects: To carry on the business of manufacturers, repairers, importers and exporters of and dealers in implements, utensils, cylinders, screws, appliances and accessories for use in connection with devices for locking electric lamps of all kinds and for preventing the removal of lamps from the holders, &c., and to adopt agreements (1) with C. H. F. Thompson and J. A. Macdonald, (2) with the said J. A. Macdonald, and (3) with A. H. Leggett. The first directors are:—Brig.-Gen. A. H. Leggett, C.M.G., D.S.O., 3, Meadow Road, Ashtead, Surrey; Capt. V. Gordon, 12, St. James's Square, S.W.1; Comdr. C. C. Sherman, R.N., Woodville, Ashtead, Surrey; and J. N. Evans-Jackson, 37, Queen's Gate Gardens, South Kensington, S.W.7. Remuneration, £150 each per annum (chairman, £200), free of tax. Solicitors: Parkers and Hammond, Friars House, New Broad Street, E.C.2. Registered office: 83, Pall Mall, S.W.1.

Radio Exhibitions, Ltd. (209,754).—Registered November 18th as a company limited by guarantee and not having a share capital, with 1,000 members each liable for £5 in the event of winding up. The objects are:—To promote and encourage exhibitions of appliances and apparatus of all kinds used for radio-telephony and telegraphy, submarine signalling and radio transmission of every kind, to organise and hold or take part in organising and holding such exhibitions in London or elsewhere; to carry on business as proprietors or managers of exhibition halls, &c. The first directors are:—R. A. Lodge, A.S.A.A., 24, Stanley Gardens, Hampstead, N.W.3 (secretary and chief accountant of Radio Press, Ltd.); P. W. Harris, M.I.R.E., 29, South Ridgeway Place, Wimbledon, S.W.19 (editorial manager of Radio Press, Ltd.); and W. F. Edwards, A.S.A.A., Cartref, Fairfield Avenue, Edgware (commercial manager of Radio Press, Ltd.). Secretary: R. A. Lodge. Solicitors: Hodgkinson and Bonnett, 124, Chancery Lane, W.C. Registered office: Bush House, Strand, W.C.2.

Helikon Wireless Co., Ltd. (209,716).—Private company. Registered November 16th. Capital, £300 in £1 shares. Objects: To carry on the business of manufacturers of and dealers in wireless accessories, electricians, mechanical engineers, &c. The subscribers are:—J. Roysentul, 45, Woodberry Grove, N.4, electrical engineer, 5 shares; R. Fishler, 26, Dempsey Street, Stepney, E.1, clerk, 2 shares. The first directors are not named. No share qualification required. Solicitors: Lach Szyrma & Co., 18, Old Compton Street, W.

U-Phone Company, Ltd. (209,701).—Private company. Registered November 14th. Capital, £15,000 in £1 shares. Objects: To carry on the business of manufacturers of and dealers in gramophones, phonographs, musical and sound-producing instruments, sound boxes, horns and instruments, apparatus, accessories and materials capable of being used in connection with radio-telegraphy and telephony, in particular, cables, wires, ropes, accumulators, batteries, detectors, meters, tuning switches, induction coils, condensers, headphones, thermionic valve panels, valve receivers, amplifiers, aerial and other insulators, &c. The directors are:—R. Burrill, 19, Lascelles Terrace, Roundhay Road, Leeds, cabinet maker; W. H. Wilks, 31, Blenheim Place, Leeds, cabinet maker; F. Whiteley, 116, Scarr's Lane, Milnsbridge, Huddersfield. R. Burrill may retain office while holding 1,000 shares. Qualification of directors, £100. Remuneration as fixed by the company. Solicitors: Simpson, Peckover, Curtis & Batley, 41, Park Street, Leeds. Registered office: Conway Factory, Harehills Lane, Leeds.

Lustrolux, Ltd. (209,719).—Private company. Registered November 16th. Capital, £25,000 in £1 shares. Objects: To acquire the whole of the property and assets of Crowther & Osborn, Ltd. (in liquidation), and to carry on the business of manufacturers and repairers of all kinds of apparatus and articles used in the generation, distribution, supply of electricity or electrical energy, or which are used or capable of being used for medical, scientific, radio-telegraphic or telephonic transmitting or receiving purposes, electricians, mechanical engineers, weavers and knitters of natural or artificial silk, cotton, woollen or worsted spinners, &c. The directors are:—O. W. Porritt, Torside, Helnshore, Lancs., woollen manufacturer; W. L. Turner, Abbey Manor, West Kirby, Cheshire, metallurgist (both permanent, subject to each holding 250 shares). Remuneration as fixed by the company. Secretary (*pro. tem.*): W. J. Battison. Solicitors: F. R. Locke, 9, Cook Street, Liverpool.

Felcourt Products, Ltd. (209,806).—Private company. Registered November 20th. Capital, £100 in 1s. shares. Objects:—To carry on the business of manufacturers and repairers of, and dealers in plant, machinery, apparatus, and appliances for agricultural, horticultural, electrical, radio, automobile, aerial, engineering, building, cabinet-making, furniture-making, chemical, and other businesses; builders, contractors, electricians, furnishing and general ironmongers, timber merchants, sawmill proprietors, &c. The directors are:—R. B. Matthews, Greater Felcourt, East Grinstead; W. H. Pike, 1, Felcourt Cottages, East Grinstead; W. H. R. Pike, "Oaklands Cottage," Lingfield, Surrey. Qualification, 5 shares. Remuneration as fixed by the company. Secretary: Miss Elsie E. Elmitt, The Orchard House, Felcourt, East Grinstead.

W. A. Rood, Ltd. (209,826).—Private company. Registered November 20th. Capital, £200 in £1 shares. Objects:—To adopt an agreement with W. A. Rood and E. H. Pearce and to carry on the business of electricians and wireless dealers formerly carried on by them at 74, St. George's Road, Kemp Town, Sussex. The directors are:—E. H. Pearce, 26, Lewes Crescent, Brighton, barrister; W. A. Rood, 74, St. George's Road, Kemp Town, Sussex, electrical engineer. Qualification, £5. Remuneration, £10 each per annum. Secretary: E. H. Pearce. Registered office: 74, St. George's Road, Kemp Town.

Maywood Engineering and Electrical Manufacturing Co., Ltd. (209,816).—Private company. Registered November 20th. Capital, £2,000 in £1 shares. Objects:—To acquire the property and assets of Major L. Russell-Wood, and to carry on business as electrical, mechanical, and hydraulic engineers, manufacturers of electrical apparatus and engines of all kinds, carriages, vans, wagons, carts, cycles, and other vehicles, &c. Power is taken to carry on business as chemists, druggists, and manufacturers of, and dealers in all chemicals, drugs, or other articles, &c. The subscribers (each with one share) are:—P. E. Mann, "Woodlands Glen," Tinsley, Sussex, chartered secretary; J. A. Stocker, 701, Salisbury House, E.C.2, chartered secretary. The first directors are:—P. E. Mann (chairman) and Major L. Russell-Wood. The latter is a life director so long as he holds 1,050 shares. No qualification required for other directors. Each of the shares numbered 1-350 has five votes so long as they are in the name of Lady Mills. Solicitors: Linklaters & Paines, 2, Bond Court, Walbrook, E.C. Registered office: 701, Salisbury House, London Wall, E.C.2.

Official Returns of Electrical Companies.

Leatherhead and District Electricity Co., Ltd.—Issue on November 9th, 1925, of £100 debentures, part of a series already registered.

Bucks Electric Wire and Engineering Co., Ltd.—Satisfaction in full on November 4th of debentures dated August 28th, 1924, and March 24th, 1925, securing £500 and £800 respectively.

Chloride Electrical Storage Co., Ltd. (35,389).—Capital, £500,000 in 62,000 preference, 329,625 ordinary, and 108,375 unissued shares of £1 each. Return dated June 4th, 1925. 62,000 preference and 329,625 ordinary shares taken up. £75,738 paid on 48,750 preference and 26,988 ordinary shares. £315,887 considered as paid on the remainder. Mortgages and charges, nil.

John Davis & Son (Derby), Ltd. (66,606).—Capital, £35,000 in 20,000 ordinary and 15,000 preference shares of £1 each. Return dated July 8th, 1925. 15,000 ordinary and 11,000 preference shares taken up. £26,000 paid. Mortgages and charges, nil.

Anglo-American Telegraph Co., Ltd. (2,891C).—Capital stock, £7,000,000 in £310,480 ordinary, £3,344,760 preferred ordinary, and £3,344,760 deferred ordinary stock. Return dated June 5th, 1925. All stock taken up. £600,000 paid. £6,400,000 considered as paid. Mortgages and charges, nil.

Greenwood & Batley, Ltd. (27,098).—Capital, £600,000 in 140,000 preference, 354,585 ordinary, and 105,415 unclassified shares of £1 each. Return dated August 5th, 1925 110,660 preference and 354,585 ordinary shares taken up. £201,312 paid (being £1 per share on 69,340 preference and 121,340 ordinary, 6s. on 14,660 preference, and 10s on 12,520 ordinary shares, and including £39 paid on 130 shares forfeited). £247,515 considered as paid on the remainder. £26 in arrears. Mortgages and charges, £100,000.

Ackroyd & Best, Ltd. (54,600).—Capital, £25,000 in 3,200 preference and 1,800 deferred shares of £5 each. Return dated October 5th, 1925. All shares taken up. £15,500 paid on 3,100 preference shares. £9,500 considered as paid on 100 preference and 1,800 deferred shares. Mortgages and charges, £50,000 sealed debentures.

Evershed & Vignoles, Ltd. (43,206C).—Capital, £30,000 in £10 shares. Return dated July 15th, 1925. All shares taken up. £30,000 paid. Mortgages and charges, £15,000.

Rangoon Electric Tramway & Supply Co., Ltd. (86,932).—Capital, £800,000 in 50,000 preference shares of £5 each and 550,000 ordinary shares of £1 each. Return dated May 15th, 1925. 50,000 preference and 300,000 ordinary shares taken up £485,000 paid. £65,000 considered as paid. Mortgages and charges, £413,258.

Chamberlain & Hookham, Ltd. (59,920).—Capital, £100,000 in 9,500 preference and 10,500 ordinary shares of £1 each. Return dated June 24th, 1925. 8,000 preference and 10,100 ordinary shares taken up. £36,990 paid on 7,298 preference and 100 ordinary shares. £53,510 considered as paid on 702 preference and 10,000 ordinary shares. Mortgages and charges, nil.

C. F. Casella & Co., Ltd. (106,869).—Capital, £17,000 in 15,000 ordinary and 2,000 preference shares of £1 each. Return dated October 14th, 1925. 12,204 ordinary and 2,000 preference shares taken up. £3,504 paid. £10,700 considered as paid. Mortgages and charges, £1,400.

Globe & Simpson, Ltd. (173,934).—Capital, £4,000 in £1 shares. Return dated August 21st, 1925. 3,100 shares taken up. £2,450. £650 considered as paid. Mortgages and charges, nil.

Rawlings Bros., Ltd. (67,908).—Capital, £100,000 in 30,000 preference and 70,000 ordinary shares of £1 each. Return dated September 25th, 1925. 20,685 preference and 50,744 ordinary shares taken up. £71,429 paid. Mortgages and charges, nil.

Baynes Electrical Co., Ltd. (176,835).—Capital, £2,000 in £1 shares. Return dated October 26th, 1925. 213 shares taken up. £213 paid. Mortgages and charges, nil.

Electro-Mechanical Brake Co., Ltd. (98,226).—Capital, £30,000 in 2,500 preference and 27,500 ordinary shares of £1 each. Return dated November 9th, 1925. 1,500 preference and 22,500 ordinary shares taken up. £17,965 paid on 1,500 preference and 16,465 ordinary shares. £6,035 considered as paid on 6,035 ordinary shares. Mortgages and charges, £7,500.

Barsi Light Railway Co., Ltd. (44,589C).—Capital, £800,000 in 50,000 preference and 30,000 ordinary shares of £10 each. Return dated October 28th, 1925. 50 000 preference and 26,000 ordinary shares taken up. £759,267 10s. paid. £732 10s. in arrears. Mortgages and charges, £140,000 4 per cent. debenture stock and £114,700 4 per cent. "Latur Extension" debentures (balance of £125,000 issued).

White, Jacoby & Co., Ltd. (52,494).—Capital, £7,500 in £1 shares. Return dated October 9th, 1925. 5,794 shares taken up. £3,437 paid. £2,357 considered as paid. Mortgages and charges, £1,500.

City Notes.

Reports and Meetings of Electrical Companies, Dividend Results, &c.

French Companies.

Negotiations are in progress for the absorption of the works and business of the *Société des Câbles de Lyons* by the *Compagnie Générale d'Electricité*, of Paris.

The *Société Le Fil Dynamo*, of Lyons, has decided to pay out of net profits of 486,000 fr. a dividend at the rate of 20 fr. per share for the past year.

The *Société Industrielle des Téléphones* records profits of 9,236,000 fr. for the past year. The dividend is expected to be at the rate of 50 fr. per share.

The *Société Electro-Câble* reports net profits of 4,460,000 fr for 1924-25, as compared with 4,191,000 fr. in the previous year. In 1923-24 the ordinary shares received a dividend at the rate of 40 fr. per share, and it is assumed that the same rate will be distributed for the past year.

Barbados Electric Supply Corporation, Ltd.

The report for the year ended June 30th last records a trading profit of £10,078, as compared with £9,069 in the preceding year. After charging debenture and loan interest and expenses, and putting £1,000 to reserve for taxation, there remains available a sum (including £1,577 brought forward) of £8,514. Of this amount £5,000 is transferred to depreciation reserve, £2,000 to renewals reserve, and the balance of £1,514 is carried forward. £3,997 was spent on capital account during the year. The growth in the demand has necessitated the extension of the plant; a further 340 kW of Diesel generating plant has been ordered, which will increase the plant capacity to 780 kW. Meeting: December 2nd.

Western Telegraph Co., Ltd.—The report for the year ended June 30th last states that the revenue was £1,472,374 and the working expenses £804,780. After providing for debenture interest and taxation and adding £327,323 brought forward, there remains an available balance of £862,335. The directors have transferred £250,000 to general reserve. Four dividends, totalling 10 per cent., free of tax, have been paid, and a balance of £300,440 is carried forward. The meeting was to be held yesterday (Thursday).

Stock Exchange Notices.—Dealings in the following have been specially allowed by the Committee under Rule 159:—

Auckland Electric Power Board (5 per cent: Water Power Conversion and General Extension Purposes Loan, 1925).—£250,000 5 per cent. debentures, 1946, issued at 98 per cent., partly paid and fully paid.

Richmond (Surrey) Electric Light and Power Co.—163,670 new shares of £1 each issued at 24s., partly and fully paid, Nos. 31,331 to 200,000.

Ferguson Pailin, Ltd.—90,000 ordinary shares of £1 each, fully paid, Nos. 30,001 to 100,000 and 130,001 to 150,000. 60,000 7 per cent. cumulative participating preference shares of £1 each, fully paid, Nos. 1 to 30,000 and 100,001 to 130,000.

Application has been made to the Committee to allow the following to be officially quoted:—

Melbourne and Metropolitan Tramways Board.—Stock and partly-paid scrip for £300,000 5 per cent. stock, 1944.

United River Plate Telephone Co.—152,000 ordinary shares of £5 each fully paid, Nos. 760,001 to 912,000.

Shawinigan Water and Power.—$2,000,000 capital stock.

Companies Struck off the Register.—The names of the undermentioned companies have been struck off the Register and they are thereby dissolved:—

Giband Magneto Co. (England), Ltd.
International Dowsing Electric Heating and Appliances Co., Ltd.
Lobito Benguella and Catumbella Electric Light and Power Co., Ltd.
London Electrical Trading Co., Ltd.
Northern Electrical Engineering and Plating Co., Ltd.
Romapac Tramway Construction Co., Ltd.
Tramway (Conduit) Point Syndicate, Ltd.

Swiss Company.—The directors of the *Maschinenfabrik Oerlikon* state that an improvement took place in the activity of the works in 1924-25. At present deliveries often have to be made at less than the cost of production, and at the same time guarantees have to be given which can only be reached by the most careful and precise manufacturing. The net profits for 1924-25 were 1,740,000 fr. as against 1,760,000 fr. in the previous year, and the dividend on the share capital of 16,000,000 fr. is at the rate of 8 per cent., as before.

Belgian Company.—The *Société des Câbleries et Cordoeries du Hainaut*, of Dour, which has a capital of 4,854,196 fr., reports a net profit of 1,059,854 fr. for the last financial year, as compared with 672,110 fr. in the preceding year. No dividend was paid in 1923-24, but this year a sum of 455,000 fr. is being distributed among the shareholders, this being equal to a dividend of about 9¼ per cent.

German Company. — *Rhenish-Westphalian Electricity Works.*—A profit of 12 million marks is reported for the year 1924-25, permitting of the payment of dividends of 8 per cent. on the bearer shares, and 12 per cent. on the registered shares. The sales of electricity were 58 per cent. above those of the preceding year.

New Issue.—*Electrical Distribution of Yorkshire, Ltd.*—The directors state that the recent issue of 250,000 shares of £1 each was applied for more than twice over.

Parsons Foreign Patents, Ltd.—The net profit for the year ended June 30th last was £2,299. To this is added £456 brought forward, making £2,755. Dividends of 5 per cent. on the ordinary and 22.5d. per share on the deferred shares are being paid, leaving £119 to be carried forward.

Edison Swan Electric Co., Ltd.—A dividend of 10 per cent. (as in 1924) is recommended on the ordinary shares in respect of the year ended June 30th last.

Barcelona Traction, Light and Power Co., Ltd.—A dividend of 1½ per cent. has been declared on the 7 per cent. non-cumulative participating preference shares.

Power-Gas Corporation, Ltd.—A dividend at the rate of 4 per cent. is recommended for the year ended September 30th last.

Stocks and Shares.

MONDAY EVENING.

STOCK Exchange markets are mainly quiet. Rubber continues to prove the devouring element of money, public attention being largely absorbed by the rush to buy rubber shares on account of the strength of the produce. Other markets are thrust on one side. So are members who try to deal in rubber shares. After being treated like a Rugby football for strenuous hours in the Stock Exchange, and signing innumerable contracts up to nearly midnight, the weekly commentator upon electrical stocks and shares may deem it discreet to apologise in advance for possible lapses in his English.

New issues are well taken where they present attraction. The Lancashire Electric Light & Power Company's offer of preference and ordinary shares was promptly over-subscribed. Allotments are expected to appear towards the end of this week. Applicants who are not already shareholders in the company will receive but modest allotments. Newcastle-on-Tyne Electric new ordinary shares are changing hands freely on the basis of 1s. 6d. premium. Active business is increasing in the Richmond Electrics distributed by the Bournemouth and Poole Company. The price has risen to 7s. 6d. premium, and investment paid up to 8s. premium for the shares.

Bournemouths are easier at 59s. after their steady advance, and the list of London shares is quietly firm. South Londons and Westminsters show small gains. Charing Cross and Bromptons are both slightly easier. Edmundsons rose 6d. to 24s. Yorkshire Electrics at 30s. have hardened.

British Insulated are ⅛ up, at 3¾, thanks to board's recommendation that £333,333 of reserves shall be capitalised, and distributed as ordinary shares in the proportion of one new share for every three old shares held. The new shares will not rank for the interim dividend, but will participate in the final dividend for the year ending next month.

Edison Swans slipped back to 8s. 6d., there being some disappointment at the retention of the dividend, just declared, at 10 per cent. Optimism had looked for 12½ per cent. Siemens have recovered to 35s. 6d. Johnson & Phillips, now ex dividend, stand higher at 58s. 9d. Metropolitan-Vickers have been again in favour by reason of the contracts that the company is securing, and the price strengthened to 27s. Callenders reacted to 3 5/16; General Electric drooped to 29s., although it is said that the company is doing very well in the wireless branch of its business.

Marconis remain at 26s. 3d., and are a languid market. Canadians are dull at 5s. 9d., there being little interest taken in them. Radio Corporations have gone back to 9⅜ for common and preferred, New York offering the shares with freedom on account of the recent decline shown in the company's earnings. The South African Wireless Company has signed an agreement with the British Post Office for "beam wireless."

Western Telegraphs are 5s. up at 17⅝, upon recognition of the shares' cheapness as compared with those of the other parties in this group. The company has declared the usual dividend at the rate of 10 per cent., tax-free, per annum. Anglo-American deferred stock is ¼ better at 24⅝. United River Plate new shares are quoted but slightly under the price for the old. Oriental Telephones are better at 43s. Automatic Telephones keep firm at 2½. Curiosity is excited by a further advance in the ordinary shares of the International Automatic Telephone Company. These are now up to 34s. 6d., notwithstanding the option to buy them, at 30s., held by the American firm of Gary & Co. The advance in price is held to imply some possible rearrangement of the Gary agreement, but nothing is known, up to the time of writing, on this head.

Underground Electric Railways Income bonds are a point to the good at 98, but the rest of the railway market is dull. District, Metropolitan and Central London stocks are down from ½ to 1. The London traction issues have not changed.

While Mexican Light Common and Preferred are both 2½ lower, the company's 5 per cent. first mortgage bonds have put on 2 points. Anglo-Argentines exhibit strength; Brazilian Tractions are again a dollar down at 78. In Amsterdam and Berne, issues have been made within the past week of 7 per cent. 15-year bonds of the Berlin municipal electricity works. The Dutch terms were 91½.

Babcocks are better at 52s., but there is a good deal of irregularity in iron, steel and allied shares. The rise in the price of raw rubber has had no unfavourable effect upon shares in the cable manufacturing group, while it has served to lash the rubber share market into a condition of extraordinary animation, with the usual sequel of physical fatigue to those engaged in dealing.

A Small Hydro-Electric Scheme.—An interesting small hydro-electric scheme has recently been completed at Lunesdale, near Lancaster, for a supply of electricity to Hornby Castle for Mr. H. C. W. Foster. The picturesque stream, Roeburn, has been harnessed to generate the electrical energy. The water wheel of the old mill at Wray has been removed and supplanted by an immersed turbine of 30 h.p., fed from the high dam and from an automatically-filled tank. The turbine is fitted with a flexible coupling and an automatic oil-pressure governor. It has a propeller-type runner, and is complete with guide valves, &c. A 20-kW compound-wound generator is coupled and supplies a three-wire system at 500 V. It is of the two-bearing type, and is equipped with a static balancer to deal with 25 per cent. out-of-balance load. An ironclad switchboard supported on a steel frame carries the necessary distributing switchgear and instruments. The transmission line (53 poles) is 2,700 yards long. The aerial cables run in an approximately straight line to a terminal pole to the east of Hornby Castle. From this pole the line is branched to the castle and to the estate workshops. Immersion heaters controlled by an automatic system, a thermostatic switch operating tappet switches, are installed for water heating in the castle. In the workshops a 25-h.p. B.T.-H. motor is installed, directly coupled to an "Aston" generator for charging the batteries for the lighting supply of the castle and outer buildings. A 15-h.p. motor drives a line of shafting, which operates circular saws, planing machines, &c. It is also intended to electrically equip the laundry, in which a 30-h.p. oil engine is at present installed. The work has been carried out by the Austin Lighting Co., Ltd., Banbury. Tests have given entire satisfaction. It is expected that the village of Hornby will ultimately benefit by the scheme.

Canadian Electrical Imports and Exports.

The following figures, showing the imports into and exports from Canada of electrical and similar materials during the year ended March 31st, 1925, are taken from the recently-issued trade statistics. Figures for the year 1923-24 are given for purposes of comparison, and notes of any increases or decreases have been added :—

	1923-24. $	1924-25. $	Inc. or dec. $
Imports.			
Copper wire, plain, tinned, or plated—			
Total	67,000	71,000	+ 4,000

The total value of all electrical apparatus, including lamps and fixtures, imported into the Dominion rose from $12,110,000 in the fiscal year ended March, 1923, to $13,977,000 in the following 12 months and $14,289,000 in 1924-25, whilst that of similar apparatus exported fell from $1,884,000 in 1923-24, to $1,582,000 in 1924-25. These totals do not include wire and cable.

Conditions in Canada.—Following upon their American report, Col. Willey (president of the Federation of British Industries) and Mr. G. Locock (assistant director) have contributed some notes on their visit to Canada to *British Industries*. In a number of respects these impressions run parallel to the American report; for instance, it is mentioned that Canadians, in common with Americans, have an idea that this country is "down and out." The extent of American influence is commented on. The business methods of the two countries are similar; means of communication are rapid; American advertisements are constantly before Canadians' eyes; and there are now 1,100 branch factories of American firms established in Canada, with the natural result that such factories turn for their supplies more naturally to their parent country than to Great Britain. In spite of these handicaps there is without doubt a great opportunity for British trade in Canada, since there is a real sentiment in favour of British goods, when they can be obtained on anything like equal terms. It is, however, essential that British exporters should pay attention to quick deliveries, generous terms to their agents, more widespread advertising, and adapt themselves to Canadian conditions. Special opportunities are said to exist in British Columbia.

Marine Radio-Telegraph Apparatus.

Some Comments and New Devices.

By Major B. BINYON, O.B.E., M.A., M.I.E.E.

(*Abstract of Chairman's Address*: WIRELESS SECTION *of the* INSTITUTION OF ELECTRICAL ENGINEERS.)

I AM duly sensible of the responsibility which now falls upon me at a time which, I think, is somewhat critical in the further development of this important section of the Institution.

With the advent of broadcasting it is not unnatural that the demand for an independent institution of radio engineers should again arise. This matter is receiving the attention of your Committee, which has drafted a number of recommendations for submission to the Council of the Institution; it is not in our interests to seek any enlargement of membership at the expense of status.

Marine Radio Apparatus.

There has been no new international legislation since the Radiotelegraphic Convention of 1912, and although the principal powers have introduced national rules to meet new technical conditions, there is urgent need for the co-ordination of such regulations by international agreement. The General Post Office, Board of Trade, and the fighting Services, through committees on which the wireless companies are represented, are revising our national wireless regulations.

Ships spark sets are usually made in three standard sizes: 1½, ½ and ¼ kW, the rating being defined as the power supplied from the motor-alternator to the primary of the h.p. transformer. Modern practice is to supply the transmitter components completely assembled, usually in an iron structure of the switchboard type. The use of an expanded mild-steel protective enclosure is quite satisfactory in most cases, but care in design is necessary with regard to the distribution of the magnetic field from the h.f. inductances, otherwise appreciable losses can be set up.

The principal types of spark-gap in use to-day are the synchronous and quenched gaps. In a paper read before the Section in June, 1922, Mr. Lea dealt with the merits of the synchronous gap and showed that, as a high-frequency generator, it had an efficiency of the order of 70 per cent. He pointed out, however, that the only criterion which is of importance is the ratio of the power used to the signal strength received.

In order to make a comparison on this basis, tests have recently been carried out by my company to compare the two types of spark transmission, and to ascertain their relative merits with what is commonly called i.c.w., the use of which in the mercantile marine is of importance, for it is the only reasonable method by which a gradual transition from the spark system to c.w. can be effected without undue capital loss.

The results show the efficiency of i.c.w. over the spark systems both for signal field strength and audibility. The audibility of quenched gap is singularly poor for the field strength; the synchronous gap gives good audibility with a weaker field strength than either quenched gap or i.c.w., while the last named gives good field strength, good audibility, and good tuning, and the same audibility (on crystal) may be obtained in comparison with a synchronous spark with much less power. If lower receiver decrements were employed, i.c.w. should give even better results on account of its sharper resonance curve.

Power for power, a larger aerial current is obtained with a quenched gap than with a synchronous gap, which is of especial interest in view of a regulation recently introduced by the Post Office basing the range of ships' stations upon the metre-ampere standard. This regulation is very convenient for ship inspection purposes, but by ignoring the factors of audibility and tuning, it definitely favours the adoption of a quenched gap, particularly on the smaller class of ship having low masts and low-power sets. These results are directly contrary to the generally-accepted view that i.c.w. gives poor audibility with crystal reception, but all ships now fitted with c.w. installations also carry spark sets, and more information is urgently needed as to whether i.c.w. can be relied upon to carry out all the functions of a spark transmitter, bearing in mind the receiving conditions aboard other ships.

Lifeboat Installations.

Legislation has recently been introduced for the compulsory fitting of wireless sets of the spark type to ships' lifeboats. There is still a wide difference of opinion whether the petrol engine or the storage battery is the more suitable prime mover; in any case, batteries must be supplied for the filaments and h.p. supply of the valve receiver. The Board of Trade regulations specify that the battery shall be of sufficient capacity to provide for transmission of Morse signals for six hours continuously with a power of 15 metre-amps. in the aerial. The accepted definition of "Morse" load is 60 per cent. of the increase in load produced when the key is pressed.

The quenched-gap system is the most suitable for lifeboat sets; the circuits can be simple and auto-coupled, and the gap needs no adjustment and is unaffected by moderate variations in alternator speed. The Board of Trade regulations require only one wave, *viz.*, 600 metres, with 15 metre-amps. in the aerial. The height of a lifeboat aerial averages from 6 to 7 metres; hence, to obtain 15 metre-amps. an aerial current of not less than 2.5 amps. is required. To attain this current in a very small aerial (the average capacity is 0.00019 mf.) very high potentials are necessary, which considerably increase the insulation difficulties under wet conditions. The aerial potentials (crest value) measured under working conditions are of the order of 40,000 volts.

To test the efficiency of a lead-in insulator, salt water was poured over the set while in operation; the aerial current soon fell from 3 to 2 amps. and steam began to rise from the canvas-covered wood immediately surrounding the lead-in insulator, ultimately the wood dried and charred. These difficulties were overcome by fitting a large metal cowl over the insulator and a flat earthed plate of similar diameter over the woodwork surrounding the insulator.

Reception conditions in an open boat in stormy weather and with a poor aerial are likely to be very difficult, consequently valve amplification is essential. A detector valve followed by two stages of l.f. amplification is a simple arrangement entailing no filament rheostats or other adjustments. If dull-emitter valves of the "peanut" type are employed, the filament current can be supplied from a single cell of the main nickel-iron pattern (1.2 volts), the entire battery (18 volts) being used for h.p. supply; h.p. batteries of the dry-cell type deteriorate too rapidly, when not in use, to be depended upon. Under "S.O.S." conditions extreme selectivity is of no importance.

Characteristics of Ships' Aerials.

The "T" aerial is most generally employed, and is usually convenient as regards the disposition of the down lead clear of other rigging; this form of aerial also enables a lower natural wave-length to be obtained without appreciably reducing the wave-length obtainable when the maximum loading inductance is of the order of 300 mics.

Single-wire aerials are coming largely into favour for the reason that, having no heavy spreaders, the inertia and wind forces are less. For single-wire aerials is is usual to employ a heavily-galvanised steel wire with a hemp core, and tests at sea show that, although the current obtained is less, there seems to be no drop in signal range, as compared with the twin copper-wire aerial.

Regulations still provide that all ships shall be capable of transmitting on 300 metres, but the natural wave-length of aerials in large ships often exceeds this figure; consequently, it is necessary to provide either a series condenser or to split the aerial and lead in the two down leads separately. The expenditure in either case is wasteful since the efficiency of such arrangements is poor, and in practice 300 metres is rarely, if ever, used by large and medium-sized vessels. The continuance of this regulation is, therefore, very undesirable.

The application of the rough formulæ for the calculation of the natural wave-length of a "T" aerial,

$$\lambda_0 = 4\left(H + l/2\right) \text{ metres}$$

is by no means accurate for ships, owing to the disturbing effects of the rigging. Tuning data obtained from a large number of ships all having a uniform type of aerial-tuning inductance indicate that the following approximate constants in the formulæ are more nearly correct:

$$\text{Twin "T" aerials } \lambda_0 = 5{\cdot}2\left(H + l/2\right) \text{ metres}$$

$$\text{Single "T" aerials } \lambda_0 = 4{\cdot}6\left(H + l/2\right) \text{ metres}$$

The porcelain chain type of insulator, if carefully designed, is probably the most satisfactory for marine purposes, though it is heavier and more expensive than either the porcelain rod or rubber strop. It is mechanically very strong and safe in use, and with a properly-designed chain the losses, when employing a 1½-kW c.w. set, should not exceed 15 watts on the most difficult wave-length and with the insulator sprayed with water equivalent to a heavy tropical rain.

Automatic Call Devices.

During 1923 and 1924 the Admiralty, at the request of the Board of Trade, conducted a series of tests with calling appliances submitted by the Post Office, Marconi's Company, and Radio Communication Co. Generally, the trials demonstrated that the long dash call gave too many false calls, and that the most suitable form of signal consisted of a series of dashes of four seconds each, separated by an interval of one second, and that it should be possible to develop apparatus to register 90 per cent. effective calls.

In one type of calling device the telephone terminals of the ship's receiver are connected to a note amplifier and the amplified current is then rectified a second time and passed to a sensitive relay of the moving-coil type; the tongue of this relay therefore follows all incoming signals, whether Morse or the special signal it is desired to select. The timing element of the selector consists of a very simple form of electric motor, the armature comprising a simple iron bar without any windings. The speed is controlled by a governor of the gramophone type, and the motor drives a magnetic clutch through a reduction gearing, the speed of the clutch being two revolutions per minute. When the magnetic clutch closes, it drives an extension shaft on which the selecting cam mechanism is mounted and, if the signal be of the correct type, the clutch is held closed until a final cam operates a contact which rings the alarm bell. If, however, the signal is incorrectly timed, the selector mechanism breaks the clutch circuit, and the cam

shaft is instantly reset to the zero position by means of a spring. A certain amount of latitude in the cutting of the cams allows for slight inaccuracies in sending; an average of only one false call in 500 was registered in the Admiralty trials.

Aural Direction Finding.

The modern tendency in the mercantile marine is to adopt small multi-turn loops, either fixed or revolving, in place of the larger single-wire triangular loops formerly employed.

In the Robinson system, in unskilled hands, the 90 deg. ambiguity may be a source of danger unless a preliminary observation be made on one coil only, and a special switch is usually provided to cut out the auxiliary coil for this purpose. In a new device designed to obviate the necessity for any preliminary observation, the reversing switch and operating handwheel are mechanically inter-connected. The handwheel is no longer rigidly connected to the spindle carrying the coils, but drives the coils through a coupling that permits a certain amount of backlash (say, one degree of arc). This backlash in no way affects the accuracy of bearings, since the indicator dial and coils are rigidly fixed on the same shaft.

The relative motion of the handwheel and shaft is utilised to operate the reversing switch, and, if the leads to the switch are connected in the correct sense, the device operates in the following way: The signal from the distant station is heard on the 'phones and the handwheel moved to and fro to the extent of the backlash; this operates the reversing switch. Generally, the two positions give unequal signals. The operator turns the handwheel in the direction giving the weaker signal, and *continues turning it in that direction*, thus turning the whole system. He then is driven away from the "90 deg.-out" bearing towards the "correct" bearing. After he has turned a few degrees, he again moves the handwheel to and fro and judges the relative signal strength. He again rotates the system in the direction corresponding to the weaker signal, and after a few attempts gets a balance. The "correct" bearing is now indicated by the pointer on the dial.

Visual and Automatic Direction Finding.

Any aural system depends to some extent on the personal element, and in consequence varying results may be obtained. A system, at present only in experimental form, has been devised to give a direct *visual* indication of the balance. The method is based on the principle that when an a.c. with a small d.c. superimposed on it is passed through a d.c. moving-coil galvanometer of sufficiently slow period, the galvanometer will show the value of the d.c., and more particularly will show when the d.c. reaches a zero value.

The standard Robinson system is used, but the reversing switch is replaced by a special motor-driven commutator that has two functions: To reverse the (i) relative connections of the main and auxiliary coils, and (ii) rectified output from the amplifier to the galvanometer in synchronism with (i). If we suppose, first, that the commutator is at rest and the coil received, the galvanometer will show a deflection of, say, 10 deg. due to the rectified signal current from the amplifier. system is in the position of balance, and that a signal is being On turning the commutator through 180 deg., the "Robinson" reversal is carried out, and the current through the galvanometer is also reversed. Since we supposed that the coil was in the position of balance, the galvanometer will again read 10 deg. in the opposite direction.

If the commutator is now run sufficiently fast, the galvanometer will not be able to follow the alternation of direction, and will stay at zero. If we now suppose that the coil system is turned so that a balance is not obtained, the galvanometer will receive more current in one direction than in the other, and will be deflected from zero. Therefore, if the coil system is rotated until the galvanometer pointer is at zero, the coil system will indicate either the correct, or the "90 deg. out" bearing.

The elimination of the "90 deg. out" bearing is done in a way similar in principle to the device described above, namely, by correlating the movement of the galvanometer pointer with the movement of the operating handwheel. The great advantage of the visual indicator method is the speed with which really accurate bearings may be taken, and that little or no previous practice is necessary. In the case of a man who has never worked a d.f. set before, the galvanometer method will give an accuracy of plus or minus ¼ deg., as compared with plus or minus 2 or 3 deg. by the aural method.

By replacing the galvanometer with a sensitive relay of the moving-coil type, a series of interesting developments are possible. The relay may be made to light one of two lamps, showing whether the coil system is to be turned to port or starboard. In aircraft, employing fixed coils, an indicator of this character should prove of value in enabling the pilot to "home" on a ground station by watching two lamps on his dashboard. If the relay is made to operate a reversible motor, or a magnetic clutch mechanism with a reversing gear, the d.f. coils can be made to turn automatically in the direction of the correct bearing.

The accuracy of any d.f. observations is affected by interference, and in the case of aural methods any interference is at once apparent to the operator. In the case, therefore, of any visual indicator or automatic system it would be necessary to provide also an aural indicator which, in the case of a ship's installation, might take the form of a loud speaker, in order that the observer may know if any interference is present and also for the purpose of identifying the transmitting station whose bearing is being observed. I believe, however, that when an efficient system of i.c.w. beacon station is introduced operating upon a wave-length of 1,000 metres, troubles from interference will largely disappear, particularly as ranges in excess of 50 miles are not generally required.

The British Electrical and Allied Manufacturers' Association.

Annual Dinner.

On Thursday last week the British Electrical and Allied Manufacturers' Association held its annual dinner at the Connaught Rooms, London. The Earl of Derby (President of the Association) was to have taken the chair, but unfortunately was unable to be present owing to the sudden death of his uncle. Col. R. K. Morcom, C.B.E. (chairman of the Council) presided in his stead, and at the commencement of the proceedings read a telegram from Lord Derby expressing his deep regret at his unavoidable absence. A telegram of condolence was sent to him from the company.

There was a large attendance of members and guests, numbering about 600. Amongst the distinguished guests were Lord Weir of Eastwood (Vice-President), Sir Philip Cunliffe-Lister, K.B.E., M.C., M.P. (President of the Board of Trade), Lt.-Col. Wilfrid Ashley, M.P. (Minister of Transport), Sir Benjamin Longbottom, Air Chief Marshall Sir H. M. Trenchard, Bt., G.C.B., D.S.O., Major-General Sir Philip A. M. Nash, K.C.M.G., C.B., Eng. Vice-Admiral Sir Robert B. Dixon, K.C.B. (Engineer-in-Chief of the Fleet), the Hon. Sir Charles A. Parsons, K.C.B., F.R.S., Sir R. L. Wedgwood, C.B., C.M.G. (General Manager, L.N.E.R.), Dr. S. Z. de Ferranti, Sir George Sutton, Sir Vincent L. Raven, K.B.E. (President I.Mech.E.), Sir Joseph Cook, G.C.M.G. (High Commissioner, Australian Commonwealth), Mr. J. S. Smit (High Commissioner, Union of South Africa), Sir Robert A. Hadfield, Bt., F.R.S., Sir H. A. Walker, K.C.B. (General Manager, Southern Railway), Sir Archibald Denny, Bt., Sir Philip Dawson, M.P., Mr. R. A. Chattock (President, I.E.E.), Sir Harry Haward and Mr. S. L. Pearce (Electricity Commissioners), Mr. W. McClelland, C.B., O.B.E., Mr. W. O. Smith, Mr. W. L. Hichens, Sir Joseph E. Petavel, K.B.E., F.R.S., and Mr. H. J. Ward (President British Engineers' Association).

After the toast of "The King," Lord Weir of Eastwood proposed "The National Development of Power Resources." Referring to the Committee of three (of which he was chairman) he remarked that the Government had not yet published its report, and he could not disclose its contents, but he did not know why it should not be published at once, nor did he know to what extent the Government would adopt the report or when it would deal with it. Nothing could be worse for industrial development than a state of uncertainty. He said he would forget the report and give his own views on the subject of the toast. He thought that the effective development of our national power resources would be ruined if the question became a political issue, or was considered from a narrow point of view. Efficiency and economy should be predominating considerations. They must look forward to the main energy requirements of the country being filled by electricity because of its potentially low costs and its applicational advantages. As yet electricity was much too expensive, and we did not use half enough of it; moreover, it should be made much easier to obtain a supply. We appeared to possess inherent possibilities of supplying electricity at a cheaper rate than any other country. Scotland and Wales possessed considerable natural resources in the shape of water power, of which the fullest possible advantage must be taken, but the main asset of the country was coal, and our real development problem was to find how best to conserve our fuel resources and convert them into electrical energy economically, and then how to make it available everywhere.

There was a dangerous illusion prevailing that British industry could regain prosperity through a drastic change in electricity supply. Prosperity could not be regained either in that way, or by legislation. A new sense of responsibility and a new unity of national effort must play the larger part, but efficiency in industry and reduction in the cost of production demanded the most efficient and economical service, and in that capacity electricity held pride of place. The problem could not be solved by any scheme involving the immediate erection at the pit-heads of giant stations using low-temperature-carbonisation processes. No one knew enough about that subject to do it on a commercial scale as yet, and we could not afford to do it experimentally. He fully believed in the pre-treatment of coal, but until much more had been discovered it was futile to speak of its immediate application to electrical development. Nevertheless any new electrical scheme should be so devised as to enable the pre-treatment of coal to be dovetailed into it when the time arrived. It was more immediately ne-

cessary and important to utilise waste heat, and any new electrical scheme should provide an open market for the sale of electrical energy generated by this means. Hitherto electricity had been generated only to meet local demands, but it could be produced cheaply as a by-product if a market were provided for it by interconnecting lines. Any change that was made must recognise the valuable work done and the progress made by the great municipalities and power companies; the enthusiasm and activity of those bodies must be conserved and developed. No sound scheme could fail to deal with the existence and continued growth of many small undertakings which every real electrical engineer would sweep away if he could.

The economics of generation were altogether different from the economics of transmission and distribution. Greater legislative freedom should be accorded to transmission and distribution, which had suffered from harassing legislation that increased the cost of electricity to no purpose. The purchase clause must be reviewed, wayleaves made easier to obtain, and overhead transmission lines encouraged. They must have recourse to common sense and give practical encouragement to the undertaker.

Turning to the question of standardisation of frequency, he was a convinced advocate of the earliest possible adoption of a standard frequency, even though it should involve substantial national expenditure. It opened out new possibilities and new freedom to develop. To the manufacturer it secured simplification and lower cost of production: to the user it meant cheaper apparatus and increased confidence in the use of electricity. The opportunity of standardisation was fast disappearing, for the cost of the change was constantly increasing. The opponents of the change could justify their opposition if the view that was taken was short enough—if they considered the conditions in a single area only; but he appealed for a national view of the matter to be taken.

He would prefer to see less money spent on the counter-propaganda of gas and electricity and more applied to teaching the consumer to use them both more efficiently. Both products were real public utilities, and such services should be efficient. Gas and electricity differed in respect of generation, for gas could be stored, but electricity could not. If gasholders were abolished he was sure the gas manufacturers would readily appreciate the value of Government help to interconnect their works.

It was not justifiable to make radical changes in electrical development unless the Government and the people had complete faith in the future of this country. Given that faith, the Government should put electricity in the best possible position to serve the country under the conditions of restored industry and higher standards of living that would obtain in the future. We were only learning how to use electricity, and should plan to-day for the best use of electrical energy 10 years hence. We had unique coal resources and a small and densely populated country, potentially offering the best possible conditions for the development of electrical energy. We had excellent municipal authorities and supply companies, and manufacturers who in the past had fought the hardest fight ever seen against the competition of foreign plant, and they could now deal with any plant requirements. In the B.E.A.M.A. they had an Association of unique value, and a president of whom the whole country was proud. To these assets let them add wider legislation, freedom, and co-ordinated effort; then our country need be in no doubt as to the successful development of our power resources.

Responding to the toast, Lt.-Col. Ashley (Minister of Transport) on behalf of the Government, expressed its indebtedness to Lord Weir and his colleagues for the care with which they had prepared their report at great personal inconvenience. The report was admirable for its lucidity and insight, but contained a good deal of explosive material, and it was not advisable to publish it just yet. However, the author had laid bare its minutest details! It had received, and was receiving, most careful attention on the part of the Government; a measure of this importance must not be hastily decided on, for one false step might do damage for generations to come. He hoped that a decision on this vital matter would be announced before Christmas. He knew that the delay was hanging up business, and the sense of that gathering would not be forgotten. The Government highly appreciated the work done by the B.E.A.M.A. for the electrical industry; it had given valuable help during the war, and its collective exhibit at Wembley last year was the finest in the Exhibition. The World Power Congress which it organised was also a distinct aid to industry.

They were all indebted to the Electricity Commissioners for the work that they had done under very difficult circumstances. It was well known that the powers that they possessed were not those that they were meant to have, but with such powers as they had, with the aid of persuasion (which was not very effective without a big stick in the background), they had done splendid work. If they had accomplished nothing else but the London electricity scheme, that alone would have justified their existence. It was of no use to look forward to great development without faith in the future. He himself had the fullest confidence in their future as a commercial nation. Unemployment was decreasing, and the demand for electricity was increasing; as electricity was the hand-maid of industry, that indicated that trade was on the upward grade. Anyone must be blind who could not see that electricity in the future would be the great agent for domestic services. It would help the housewife; it would remove the pall of fog—help hospitals—help agriculture—make travelling more comfortable—and he hoped the railway companies would in the near future see the desirability of following the example of the Southern Railway and would electrify not only the suburban but also the main railway lines. He would repeat that he was fully sensible of the necessity of forming an early decision. The Government was working at it literally every day. Finance was of vital importance; in the present state of the nation's finances, it was not easy to find such sums as might have been put down in the report, but he hoped these difficulties would be overcome.

The toast of "Our Guests" was proposed by Col. R. K. Morcom, who said he was glad to see four High Commissioners present, and hoped they would develop the "B.E.A.M.A. habit," and never look beyond its ranks for the fulfilment of their requirements. The Government Departments, which realised that the B.E.A.M.A. was out to help them, were well represented; the supply and consulting branches of the industry were also present in force, and he looked to them for increases in the order book and moderation in their specifications. There were many other eminent men, and members of trade associations and technical institutions in the fullest sympathy with their spirit of co-operation. Lastly, there were the great railways, which they hoped each year to bind more closely to the electrical industry, for the benefit of both parties.

Sir Philip Cunliffe-Lister, responding to the toast, said the gas industry was the only one left to him now, but he would be the last to under-rate the possibilities of electricity; they were both vital to the future interests of this country, and it would be a most fatal mistake on the part of either to pretend that it could completely supplant the other. There was an ample field for both; they were complementary to each other, and the closer the two industries could get together the more successful both would be, and the better it would be for this country. He still retained a close interest in the future of the Association, and of the industries combined under its ægis; they were all grumblers, but he thought the times were not too bad for electricity. He congratulated them on the co-operative spirit prevailing in the electrical industry, which had enabled them to combine effectively. They were not afraid to collect the power engineers of the world at Wembley last year, and to learn from them and teach them, individually and collectively. The Association was a great pioneer of research, which was the key to success in competition. By conviction and faith he was an optimist as to the future of British industry. Immense mischief had been done abroad by those who pretended that Britain was unable, and was not certain to surmount all her difficulties. The feeling of optimism was justified by such positive factors as the Pact of Locarno, in which the world had turned its back on war, and the great harvests throughout the world. It was up to everyone, personally, to give a push to British trade, and to help the revival of British industry by buying British goods. They should also promote the British Industries Fair, and support the British Shopping Week, which he hoped would become an annual event. By "British" he meant the whole of the British Empire; it was the help from within the Empire that had pulled us through the past crises, and the future was not only hopeful, but certain. He was sure that we had reached the turning-point.

Sir R. L. Wedgwood referred to the recent celebration of the centenary of the railways, and speculated as to the character of the next centenary, when perhaps Sir Vincent Raven's electric locomotive would be towed out of a museum for exhibition. It was exactly 21 years since the first steam railway (not an urban railway) was converted from steam to electrical operation. That was the North-Eastern Railway on the Tyneside; the Lancashire and Yorkshire Railway followed three days later. Progress in this country had been slow and limited. No case had yet arisen where the economies to be effected by electrification had been the primary reason for adopting electric traction; that was the problem to be solved—then the electrification of the main lines must follow speedily. The deciding factor was the voice of the sleeping partner of industry—coal; so long as coal was cheap, the steam locomotive would hold its own, except for suburban services. In other applications of power, electricity was driving steam out of the field, and was the motive power of the future. Electrical manufacturers could look back on a year of reasonable prosperity, and forward to one equally promising.

Major-General Sir Philip Nash, rising to propose the toast of the "Chairman," expressed his regret at the absence of Lord Derby, but felt that he could not recall a B.E.A.M.A. dinner that had been more successful than this one. He was sure that things were going to improve—and very shortly.

Responding, Colonel Morcom said it was a great pleasure to hear so many speakers full of optimism. They had to make the B.E.A.M.A. universally acceptable by living up to a great ideal. The President—whose absence was regretted—was a good sportsman. That was the highest praise one could wish for; it implied three ideas: to give a square deal, to be considerate to others, and to be loyal to themselves. They should remember those three criteria. Among certain people the B.E.A.M.A. was unpopular; not all its members were always loyal to the Association. They should see that all the members of their staffs were loyal, and that every buyer should be able to say that the B.E.A.M.A. always gave him a square deal. It was most important that it should be respected, and that could only be done by its being respectable. Then the B.E.A.M.A. would progress, our electrical industry would become the greatest in the world, and the B.E.A.M.A. the greatest Association the world had ever seen.

Assisted Wiring Schemes.

The Second E.D.A. Conference.

ASSISTED wiring schemes formed the subject of a paper by Mr. James Edgar, of South Shields, at an E.D.A. Conference, held on November 20th. The paper gave details of a scheme which the author had put into operation in South Shields recently, and in the discussion which followed, information with regard to other schemes in operation in various areas was given Mr. R. P. Sloan (Newcastle-upon-Tyne Electric Supply Co.) presided.

Mr. EDGAR said that, whilst supply engineers would continue to explore the industrial field for further power users, the future of the supply industry depended to a very great extent upon the expansion of the domestic load. His scheme was a simple one. Canvassers employed by local contractors approached prospective consumers, and were supplied with a number of forms containing agreements for signature by both tenant and landlord, the canvassers being paid on commission by the contractors. When forms were completed the contractor was given an official order. No initial charge was paid by the prospective consumers, and the contractors were paid by the Corporation at rates which had been mutually agreed upon, after the installation had been tested and passed. The prices paid to contractors were: for a 7-point installation, 17s. 9d. per point; for a 6-point installation, 18s.; 5-point, 18s. 6d.; 4-point, 19s.; and for all below a 4-point installation, 19s. 6d. In addition, 10s. per installation was allowed for supplying and fixing a double pole ironclad switch and fuses. The installations could be carried out in v.i.r. cable drawn into grip steel conduits, or, alternatively, in metallic-sheathed cable on the surface. All materials used must be of British manufacture At present, installations were limited to six lighting points and a plug, and covered everything up to and including lamp holders, but the lamps and shades were provided by consumers. A prepayment penny-in-the-slot meter was installed, and the charge was the flat rate charge per unit for lighting for the time being in force, plus twopence per unit for all energy consumed up to a consumption of 150 units for each £1 of capital cost of the wiring installation. The present flat rate for lighting purposes was 4½d. per kWh, so that consumers under this scheme paid 6½d. per kWh.

The first applications were received on May 12th this year. The number of private dwelling houses connected at that time was 3,434. At the end of six months from the inception of the scheme, 7,477 applications had been received, the total to date being over 9,000, of which 1,870 would eventually be connected to mains which existed prior to the adoption of the scheme; 26.25 per cent. of the applications were for three-light installations. The number of consumers connected to date was 2,950, and it was anticipated that by March 31st the number connected under the scheme would approximate 6,000.

The "service density" (*i.e.*, the ratio of the number of consumers connected to the number of potential consumers) in 24 streets which he had selected at random, averaged 13.8 per cent. before the scheme was introduced; this had increased to 50.5 per cent. The average consumption per consumer for the quarter ended September last was slightly over 17 kWh, and he assumed that the average annual consumption would be about 130 kWh. The average cost of an installation, including meter, was £7 18s. 0½d., on which the annual interest and sinking fund charges, based on a 10 years' life at 3½ per cent. sinking fund and 4½ per cent. interest, amounted to £1 0s. 7d., or, over the period of 10 years, £10 5s. 10d. The average consumption was estimated at 123.6 kWh per annum, producing, over a period of 10 years, at twopence per kWh (the extra charge in respect of the wiring and meters), £10 6s. Results to date showed that this average consumption would be exceeded. The capital to be expended on mains was estimated at £17,000, whilst the cost of 6,000 services was estimated at £18,000, a total expenditure of £35,000, the capital charges on which would amount to £2,800, equivalent to 0.88d. per kWh sold. The estimated total cost per kWh sold was 1.561d., leaving a net surplus of 2.939d. per kWh. Several consumers who had had their premises wired for lighting under this scheme had since installed heating circuits at their own cost.

Discussion.

In opening the discussion, the CHAIRMAN gave particulars of a similar scheme adopted by the Newcastle-upon-Tyne Electric Supply Co. towards the end of last September, which had worked satisfactorily so far. A year prior to the commencement of the scheme, consumers were connected at the rate of 200 per month, but applications for connection were now being received at the rate of over 1,000 per month, and he hoped that that rate would be materially increased as the scheme developed and became better known. There was a prepayment scheme, but consumers had the option of paying a straight rental; he was strongly in favour of the latter system.

Mr. EDGINGTON (West Ham) asked what was the position if a consumer vacated premises, and the incoming tenant did not wish to continue to take electricity. The cost of installation in South Shields was apparently far below the London cost.

Mr. HOWARD SMITH said that the scheme was not very favourable to the contractor. He urged that in the adoption of these schemes the supply authorities should work with the contractors.

Mr. W. E. ROGERS (West Ham) said that the figure of £3 per service in South Shields was low, but he assumed that there was more than one installation connected to each service. He asked on what terms money was borrowed to carry out the work.

Mr. ABBOTT (Shropshire Electric Power Co.) said his company could not lay a service for £3. Capital charges on generating plant were likely to be heavy in the case of a small undertaking, and he suggested that Mr. Edgar's figures would not show much profit. His company had found that it paid to wire for three lighting points and one plug point free in some cases, and many consumers paid for extra points.

Mr. PAGE (W. T. Henley's Telegraph Works Co., Ltd.) said that a contractor in one district found the conditions very much against him as compared with another district, and it seemed to him that electricity was handicapped by this lack of uniformity.

Mr. MARSDEN (Sevenoaks) asked if there were any limit to the rateable value of the properties in which assisted installations were provided; whether there was any limit of distance from the main to the house; and whether the consumers were given the option of having a sixpenny or shilling meter installed. Where the cost of mains in such a scheme was excessive, part of the revenue should be allocated to this object.

Mr. HOWELL (Battersea) referred to a scheme started recently by his undertaking. The minimum number of lights in any house was six, complete with lamps, shades, switches, and so on. There was a standing charge of 16s. 3d. per quarter, inclusive of the cost of installation and meter rent, and 1d. per kWh consumed. The installation became the property of the consumer in ten years.

Mr. PINKNEY (Newcastle-upon-Tyne Electric Supply Co.) advocated that lamps should be supplied with assisted installations; it was a mistake to encourage people to get their first taste of electric light with carbon lamps, which could be bought cheaply. Apparently, Mr. Edgar did not employ registered contractors, and it seemed, therefore, that supervision must either be expensive or inadequate. Registered contractors should be employed. The contractor was able to increase output, and obtain prompt payment from a "gilt-edged" purchaser, so that, with short credit and certain payment, he was encouraged to organise for big business. By carrying out installations on a large scale, he could also reduce overhead charges, and reduce prices. He urged accessory manufacturers to organise properly on mass production lines, in order to reduce *their* prices.

Mr. W. E. BUSH (E.L.M.A.) calculated that, if 500 of the 560 supply undertakings in the country had put schemes of this nature into operation, each installation using an average of 3½ lights, the business which would result to the electrical industry would amount to £25,000,000 in six months; that indicated that supply engineers had the prosperity of the industry very much in their own hands.

Mr. F. SELLEY (Marylebone) advocated the employment of contractors for hire purchase and free wiring schemes. In a block of 540 artisans' flats which were wired on the hire system in Marylebone, over 400 were connected in 18 months. In 303 flats using electricity for lighting only, the estimated consumption for 12 months was over 26,000 kWh, and in 114 using it for lighting, heating and cooking, the estimated consumption was over 178,000 kWh. Slot meters were installed, the rate for lighting only being 7d. per kWh, 2d. going towards the cost of the wiring. There was also a "telephone" system of charging for "lighting and other uses," with an inclusive quarterly rental charge varying for two, three, and four-room flats, the rentals being 10s. 10d., 14s. 4d., and 17s. 9d. respectively, plus 1d. per kWh consumed. There was another system of wiring by hire purchase. The Electricity Department obtained competitive prices from contractors and added a percentage—never more than 15 per cent.—thus giving the consumer the benefit of the lowest tender.

Mr. V. A. HITCHMAN (County of London Electric Supply Co.) asked Mr. Edgar if he really thought that 2d. per kWh extra would cover the cost of wiring; as time went on he would probably find that maintenance was a big item.

Mr. LEON GASTER (Secretary, Illuminating Engineering Society) urged that, when a system of assisted wiring was introduced, the method of lighting should be good. He advocated dispensing with meters, and charging a flat rate per lamp. With regard to contractors, he mentioned a system which prevailed in some foreign countries, whereby registered contractors deposited £50 with a local organisation, and if they did not carry out good work they forfeited that sum and lost business.

Mr. L. G. TATE (Secretary, Electrical Contractors' Association) said the bulk of his members realised that hire and hire purchase powers could only be exercised by supply authorities, who could make their profit on the electricity sold. He and his Council realised that, to compete with a gas cooker, an electric cooker had to be hired at a price which was unremunerative to anybody depending simply upon the hire charge. The only point of difference between supply authorities and contractors was as to who was to carry out the installation work, and if the supply authorities would say that they would only employ registered contractors, the contractors would be only too pleased to support them, as they were supporting Mr. Edgar in South Shields.

Mr. ALABASTER (Bermondsey) said that a system of free wiring had been in force in Bermondsey since 1923, the installations being carried out by direct labour. The charge to the consumers was 3d. per kWh above the ordinary price, 2½d. of this being in respect of the installation, and ½d. in respect of meter rent. The supply authority supplied lamps and shades, and replaced burnt-out lamps. He asked what would be the extra cost of the service if South Shields consumers wanted more than six points.

Mr. H. T. YOUNG (Messrs. Troughton & Young) said that it was better that installation work should be carried out by contractors rather than that the supply authority should do it, because the British public were prejudiced against monopoly, and a prospective consumer, if he had no alternative than to go to the supply authority, would probably not bother at all. A fixed charge per quarter encouraged consumers to use more apparatus, and an alternative system, such as that referred to by Mr. Howell, might be offered to consumers.

Mr. C. W. SULLY (E.L.M.A.) suggested that the E.D.A. might call the various interests together to consider these schemes in detail, and collect data for the guidance of those adopting assisted wiring schemes.

Mr. EDGAR then replied to the discussion. With regard to the figure of £3 per service, he said that in many cases he was able to connect four consumers to one service cable, and, in a great many other cases, two consumers. The figure was £3 per consumer, not £3 per service. It was his intention to take up cooking and heating when the work in connection with lighting had slackened down. He had not yet found a case in which a new occupier had refused to take over the installation. The risk was very small. He assured Mr. Howard Smith that the electricity department in South Shields was only too anxious to work amicably with the contractors; all the installations in Souh Shields were very carefully tested during progress and on completion. Up to the present no money had been borrowed for the scheme. The Corporation had used a special reserve fund inaugurated four years ago. Application had been made to the Electricity Commissioners, however, to borrow £10,000, and application would be made for a further £10,000 later. He believed that the period of the loan would be ten years. He did not agree that the cost per kWh should include capital charges on the generating plant because the generating plant was already there, and there must be sufficient overload capacity or standby plant to meet all the load which would arise from these comparatively small consumers for some time to come. There were only the extra generating costs and distribution costs. He took no account of the rateable value of the properties which were wired under this scheme. As to the limit of distance from the main, he said that the tenemented property adjoined the footpath, and it was only necessary to run from the footpath straight in to behind the front door. The Corporation laid a new distributor along any street provided it was satisfied that the revenue would equal at least 20 per cent. of the cost of laying the cable. If a shilling-in-the-slot meter was desirable, and was asked for, it was installed instead of the penny-in-the-slot meter. When the scheme was started there was only one registered contractor in South Shields, but he believed many had now applied for registration. Out of approximately 3,000 installations connected there had been a very small number of installations condemned because the insulation resistance was not sufficiently high. He agreed that the number of orders placed in the hands of contractors should have a tendency to reduce the price per point.

He had not found it necessary to follow up the consumers in order to sell irons, because a very large number were purchasing irons themselves. The manager of the local Co-operative Society, which had an electrical department, had agreed to allow its members to have such apparatus as electric irons on easy-purchase terms, and the plan had been very successful. Since the commencement of the scheme, in May, the Corporation had paid the local contractors over £15,000, and he had recently got his Committee to certify another £3,000 to £4,000 for a month's work. He agreed that two systems of charging might be advisable, but the scheme he had introduced was rather too young to justify experiment at this stage, and perhaps after twelve months' working the question of introducing some other system of charging might be considered.

The Engineer and his Duty.

His Due and his Duty in Life.

(*Abstract of paper read before the* INSTITUTION OF ELECTRICAL ENGINEERS.)

MR. T. CARTER, M.I.E.E., commences his eight-page paper with an outline of the rights and duties of life; having reminded his hearers of what an engineer is, he asks how the life of an engineer may have its fullest usefulness. The author maintains that we have not long begun to realise how much a problem like this concerns us as a nation. We make far too little attempt to ascertain whether those who decide to be engineers are real engineers; we also let many escape into other occupations who should be compelled to come into engineering. The finding of engineers to train is far more important than the finding of methods of training them. Strictness at the beginning may reduce the number of those who become engineers; but that is what is needed. The proper selection of potential engineers and the rejection of all others would so increase the efficiency of the profession that there would be no lack of directing ability. To keep its place in the world, a nation must more and more cherish and utilise every one of its members to the fullest of his possibilities.

In pursuit of our aim, we must discover the inmost nature of children at an early age, and it may be hoped that teachers will more and more try to do this as part of their work. Tests of intelligence and vocational tests are being made tentatively in many places, both of children still at school and of those passing out into employment, and suggestive information has already been collected. By checking attainment against prediction, thus keeping abreast of each child's development, it will eventually be possible for the head of a school to give definite advice regarding the career of at least some of his scholars.

Dr. Johnston, of Highgate School, keeps records of all boys, even those of average capacity, which are systematically studied as they go through the school, so that they may be guided into appropriate callings. Dr. Johnston writes: "There are two ways in which help can be given: first, and in practice more important and helpful, though it is on the negative side, we are able to inform parents with great confidence what form of activity the boy should *not* attempt, and I have always advised parents to let no boy become an engineer unless he combines in his capacity two particular forms of talent: (*a*) real aptitude in dealing with scientific apparatus and adapting means to ends, and a real feeling for the purpose of machinery in general; and (*b*) distinct capacity in the practical applications of mathematics and the use of mathematical formulæ for utilitarian purposes. If he has higher mathematical knowledge and could deal with the abstractions of theory, so much the better, and he might become a better and greater designing engineer. . . .

"Secondly, on the positive side, I have found it possible to do a certain amount, but not very much. Of the many positive suggestions that are given, all valuable in some way, 20 or 30 per cent. yield important results."

The very facility with which we may pick up a smattering of a subject nowadays, and the ease with which a thin veneer of showy knowledge is spread over great slabs of essential ignorance, may lead us back to the conditions of the dark ages, if we are not careful. If we are to apply our knowledge to the best advantage in our practice, we must keep it as varied as we can, consistently with thoroughness; in addition, we must try to acquire the wisdom that will show us how to use it. Luck is often nothing else than a readiness for the coming chance, and an immediate grasping of it when it arrives.

One of the most remarkable things about engineering is that there is scarcely a region of the world's activity into which the engineer's direct influence does not extend. The contrivances of engineers having made so much possible and even inevitable, must not they now, when they see the monster that has been created, design some new contrivance that will so mollify and tame it that the world may once again be safe?

On the whole, engineers have not taken much part hitherto in public life; many of them are by nature not fitted for it, though that is not to say that all who are in it now are pre-eminently suitable. Some engineers, however, in addition to their technical accomplishments and their ingrained habits of reflection and investigation and logical deduction, have so clear a view of what is wrong in affairs generally, and of what may have to be done to put it right, that they ought certainly to be in positions of wide authority, dealing with public problems not merely as engineers, but as men of the world with special qualifications because they are engineers. The way out of the turmoil will only be found by patient thought and long consideration and conference, and the public-minded engineer is peculiarly well suited for this. Parliament cannot do much to devise remedies; its main province is to register in its Acts the state of public opinion at a given moment, and thus to create conditions favourable to progress along desired lines; and it is for those who are faced by any problem to work out a solution for it, and then, convinced that they have found it, to go and ask Parliament to sanction it. If some engineers were also members of Parliament and of other great deliberative bodies, many problems would be passed into practice with increased effectiveness, and the whole outlook of public life might be redirected for the better. Thus would full usefulness be reached in service to the nation; engineering would become a still finer thing than it is; and the life of an engineer would be more desirable because his work would be more highly appreciated.

Discussion in London.

Mr. J. SWINBURNE, F.R.S., opened the discussion with some nteresting remarks on the subject of education, of which a lear definition was, he said, needed. The four essentials vere to teach a boy, first, to earn his own living; then ygiene, &c., in order to keep him physically fit; thirdly, to e a good citizen; and, fourthly, how to amuse himself, so hat he would not become dissatisfied. In Ancient Egypt hey had some excellent engineers, and wonderful astronomers, ut they were all priests, and down to this day education was nfluenced by them. Public school headmasters were often nade bishops. Why was not the President of the I.E.E. nade a bishop? Modern education retained many features of ncient education; scholars were not taught to help themselves o think, and the whole system was based on memory; things vere taught because authorities had said that they should e taught. A university educated man knew nothing, and ie could not earn his own living, because he was taught hings that would be of no use to himself. Engineering was othing but common sense and physical science also. An ngineer was a man who "thinks straight"; engineers should ot confine their logic to themselves; they should use their ctive minds in social questions of the day. Many opinions vere products of the fallow mind. They were not real opinions, ut accidental prejudices. A little clear thought and study vould clear up many of the problems of the day. The crowd mind should also be studied; human beings were not logical, nd it was therefore desirable for engineers to exercise their ctive logical minds in public affairs.

Dr. S. Z. DE FERRANTI pointed out that however great was nowledge, character was greater still. They could not all gree with the definition of a professional engineer, in which erm he would also include the manufacturer and specification vriter, and outside was a great class of engineers, all looking or mechanical means to assist people in their daily life and vork. Such mechanisms, however, could not be usefully used xcept by engineers, and so it was fortunate that the number f mechanically-minded people was growing very rapidly, and t must be so if they were to "live." Engineers must often ossess great persuasive powers in order to enlist the help f others in giving them the means to carry out their ideas. nd in this sphere great knowledge of character was required. he great engineers of the past had also shown great perse- erance and mental effort in persisting in face of very great ifficulties. Engineers must "engineer" people in order to ive them things which the engineers thought they should ave. He hoped the paper would receive the consideration t deserved.

Mr. G. E. G. HINSHELWOOD (Student Member) said it was new departure for a student to speak at a formal meeting f the Institution, but the privilege would be appreciated y all student members, and they would benefit thereby. The igh ideals of the paper could be mostly absorbed by engi- eers, but how much better would it not be if the worker ould do so. He favoured the more careful selection of young nen who were to become engineers.

Mr. W. DAY explained that there was much in the paper hat was applicable to most callings and professions. It herefore had no special significance for engineers. If selection were adopted, what would become of the very great unfit urplus? The gift of insight to character was very rare, and t would therefore not be easy to select the desirable people.

Mrs. M. S. MATTHEWS (Graduate Member) pleaded for more elf-sacrifice in place of self-expression. Until they stepped further than "self," they would not realise the meaning of "life." Where a son was to follow his father, it would be wise to give the son the freedom of the works at a very early age, in order that the people he would later have to control might learn to respect him, and that he might appre- ciate them. She agreed with the need of the study of litera- ure as a means of enlarging the mind.

Mr. B. O. ASON said there seemed to be an idea that engi neers were not qualified for the larger posts of life. To correct hat fallacy was the biggest fight they had before them. They must aim at controlling the country by engineers instead of awyers.

Mr. P. DUNSHEATH said the paper was packed with horse- ense. Flexibility of ideas was very necessary, but it was rarely found. If a man refused to change his opinion, he had wasted the intervening year. There was too great a tendency nowadays to "smooth the path"—rather a dangerous sug- gestion, because it tended to destroy initiative. There was much to be said for choosing the right men to be made into engineers. During the war technical units had to draft into themselves men who were not engineers because such men often carried out the work better than so-called engineers. There were not many schoolmasters, however, who knew what sort of boy would make a good engineer; "he who knows, does; he who does not, teaches." Some day there might be consultants who would give advice to parents on such matters.

Mr. W. J. JOHN said that in technical education very much depended on the teachers. They should be engineers, and should be granted periodical leave, which should be spent in manufacturing works, so that the teachers themselves could be up-to-date in what they taught; there was a great gulf between a student and practice, which ought to be bridged by the teacher.

Mr. G. D. HURLBATT thought the paper of such value that it ought to have been sent to higher authorities. The author aimed a little too highly, and had weighted his paper a little too heavily on the "duty" side instead of the "due."

Mr. E. KILBURN SCOTT was of the opinion that they should capture the executive of the country. Engineers were too often exploited, and in many cases non-engineers were at the head of affairs. They should see that things were done, instead of merely talking about them. They wanted more engineers in Parliament.

Mr. T. CARTER briefly replied to the various points raised.

Correspondence.

Correspondents should forward their communications **at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

Rural Electricity Supply.

Mr. Purse's letter in your issue of November 13th is deplorable. Because I did not advocate compulsory application of the I.E.E. (1924) Rules he hits at me through the cause of Rural Development. There is something involved far greater than my reputation as a debater, or Mr. Purse's position as a maker of rules. There is a general desire throughout the country to see the benefits of electricity made available in the country districts, where there is no public supply of power, heat, and light in any form. This cannot be done unless supply engineers recognise the difficulties and help each other to remove them.

The I.E.E. Rules are no special impediment to rural supply, and I have not suggested that they are. Mr. Walker introduced them as an example of over-regulation. While a consumer can demand and obtain connection—except in a few cities—provided the leakage does not exceed 1/10,000 of the maximum current, and the fittings are in a reasonable condition—the subject is not a live one outside those few city areas. If the I.E.E. would draw up a short statement of what is required to carry out a good commercial job at £1 a point in private houses and, say, 12s. in shops, there would be some chance that we would adopt it. As it is the Rules (1924) are only used for large installations, where cost is of secondary importance.

Mr. Bartholomew does not accuse me of side tracking; he complains that I compel him, again and again, to come back to the subject he would like to leave. He does not think I am losing—his anxiety to use every possible weapon, including simulated indignation and ridicule, shows that he, the official advocate of the Post Office, is fighting all out with his back to the wall.

When we go to law, we would like to sit on the bench and try our own cases *in camera*. The Post Office has manœuvred electricity undertakers into allowing this astounding state of things until now. The facts have been known for years and talked of in private, but engineers do not like to get up against public officials and Government Departments, and no-one has moved. The reception I have received at the hands of the Post Office fully justifies any man's hesitation, but under new conditions, which have developed sooner in Mid-Cheshire than in most areas, it became absolutely necessary to make a move and to point out the fact that we have a legal remedy provided in the Electricity Acts, *viz.*: a choice of arbitration or of appeal to the Electricity Commissioners. Mr. Bartholomew has very wisely ignored this in the hope that it will be forgotten. We are reluctant to do either, so we have availed ourselves of a further remedy, *viz.*: to appeal to the public, and that is why I have written to the ELECTRICAL REVIEW in the first instance, and have sent the photograph of the Middlewich monstrosity. This cost £250; when the expenditure of £30 on the part of the company and of a little energy on the part of the Post Office would have avoided a public eyesore and a scandalous waste of public money.

I expect your readers enjoy the comic relief which Mr. Bartholomew introduces into this otherwise serious discussion. If they look at the Middlewich monstrosity as depicted in your issue of November 6th, they cannot fail to notice the resemblance of the two towers to those of modern windmills. I am certainly tilting at the towers and must accept the *rôle* of Don Quixote to that extent. If Mr. Bartholomew continues to allot these various characters to me I shall soon be able to earn a fabulous salary "On the Halls" as a Protean Artiste.

The correspondence has brought out very clearly the unreasonable attitude of the Post Office. We have this specific case—typical of others—the Northwich-Middlewich-Winsford Junction or local line. It is important to keep it overhead because of the necessity to maintain certain qualities which are lost if it is put underground—yet 1½ miles of it were put underground last year! The Post Office has met this *prima facie* case of error on its part by refusing to produce the calculations, which should exist, to justify this refusal to put a further 50 yards or so of it underground at our cost. I say that this attitude is unreasonable and contrary to our democratic form of Government; it is sheer autocracy.

We are responsible for public utility undertakings equal in public importance to the telephone service, and we decline to be fobbed off with vague talk such as this about maintenance of speech efficiency on local lines—when used occasionally for trunk calls. This qualitative talk could be used equally well to bolster up a refusal to put subscribers' connections underground if this happened to be a rule just now, because two of

these *always* form part of trunk circuits during subscribers' trunk calls.

Mr. Bartholomew says he is not used to his statements being questioned. I agree that service in the Post Office breeds that attitude—but it is very bad for him really. The important principle at stake is not which official is to blame if this particular line is on the verge of unintelligibility—which it must be if 50 yards more cannot be put underground—but whether the Post Office will supply to an interested party, information which any reasonable man would give to substantiate a disputed statement. To use Mr. Bartholomew's expression in a more polite form: Is the Post Office big enough to admit it has made a mistake in refusing technical information? As for inertia or laziness, it required far less energy to say "no" than to work out the effect of putting a section underground in a possibly doubtful case. So Mr. Bartholomew and the higher officials puff out a speech-efficiency smoke screen and melt away behind it. This is a form of inertia, or reluctance to take trouble, as I have said—or laziness as Mr. Bartholomew prefers to call it.

I do not blame them, I blame myself and the other supply engineers for our inertia in the past. It has been far easier for us to provide unnecessary gear, &c., in each case as it arose than to undertake the thankless task of persuading the Post Office to moderate its attitude, and it saved time. What was, however, merely a nuisance and an occasional expense under town conditions, where most of the Post Office lines are underground, has become a serious handicap in country work where Post Office lines are all overhead and where all ours must also be overhead because costs must be kept down; so we must get the matter put right *now*.

Mr. Bartholomew makes his case worse by setting out again the illogical actions of the Post Office. It is useless for him to spread out his hands and ask you to write me down an ass. He is, in fact, reminding those who know the Post Office "System" of many such cases in the Post Office service. In fact, unbelievable things go on continually. It has reminded me that at one time they persisted in altering our address from Northwich, Cheshire, on envelopes, to Norwich, Suffolk, delivering them to Norwich.

Mr. Purse suggests "subsidy" as a remedy. This might suit West Ham—but we provincials would rather avoid waste than ask the taxpayer to help us to over-capitalise our concerns. Up to the present we in Mid-Cheshire have avoided even a Treasury guarantee, which is a distinction in these days, and we hope to continue to be self-supporting.

W. Fennell.

Northwich, *November 17th*, 1925.

Salaries of Combustion Engineers.

It is very evident from the amount of salary offered in connection with recent vacancies for combustion engineers that the importance and value of such a man, if properly qualified, are not yet sufficiently realised in this country. As is now generally recognised, the boiler house has become the most important part of a power station from the profit-earning view, but the best efficiencies cannot be obtained unless boiler-house operation is under the close supervision of a specialist.

If shift engineers are to be encouraged to study this all-important branch of power plant engineering, some really attractive inducement must be held out in order to make the additional close study, both in the works and in spare time, worth while; to offer the same salary for a specialist or expert as is paid to the shift engineer with general training only, is not likely to encourage a man to go to the extra expenditure of time and money necessary.

The writer has had this complaint addressed to him on several occasions by men who have devoted considerable time and money to obtaining specialist knowledge, only to find that the salaries offered for the positions they desire are not such as to make application worth while.

Chas. F. Wade.

Sheffield, *November 20th*, 1925.

[We warmly endorse our correspondent's statement. The boiler-house is the Cinderella of electricity supply, but it is, as Mr. Wade points out, the place where efficient management is of the first importance. The combustion engineer must be adequately trained in chemistry and physics as well as in mechanical and electrical engineering, and ought also to be versed in psychology; he should therefore be one of the two most highly paid engineers after the chief on the staff of a large power station.—Eds. Elec. Rev.]

A Review Reviewed.

I am obliged to the reviewer of my book on the induction motor for pointing out some obvious defects, and I should be obliged if you would allow me to remark on a few of his observations. He says, in effect, that much of the utility of the book is due to the free use of the writings of Steinmetz, Walker, Kloss and Smith, and he accuses me of not paying due acknowledgment for Chapter I. I stated explicitly that I had made use of the works of Steinmetz, and, indeed, I should like to know what writer on the induction motor is not indebted to Steinmetz. With regard to Dr. Walker, although I am an admirer of his works, I am not conscious that I owe him the slightest indebtedness in this book, otherwise I should be grateful to acknowledge it. As regards Dr. Smith, I admit taking copies of torque-slip curves for Chapter I from his papers on "Design" due to the fact that I had little time to accomplish my task; otherwise I am not indebted to him for anything much that is not acknowledged. Your reviewer takes exception to the expression: "torque in synchronous watts." This term is universally used, and is not the invention of an American at all. He expresses surprise that so little use has been made of Mr. Creedy's invention and so much of the Hunt motor. The reason is that the Hunt motor has an extensive application and is a much more practical solution of the problem of speed control—although still imperfect—than Mr. Creedy's invention. While acknowledging the ingenuity of Mr. Creedy's device, I fail to see any great application for it.

The same remarks apply in lesser degree to the phase converter. One needs to preserve some right sense of proportion with regard to the space devoted to essentials and non-essentials. I am willing to submit to just criticism, but I notice that a vast amount of my own work—much of which is original, particularly on design—passes unnoticed, and credit is given to others. I think it is due to the purchasing public that the man who sits in judgment on the work of his fellows should have the courage of his convictions and sign his name to the review, so that it may know what weight to put on his criticism.

In this instance it would seem that the reviewer has not read the book at all, but has seized on a few trivial points which are relatively unimportant on which to place his carping criticism, and, further, he is guilty of making vague, general observations, which is what one would expect from one who makes a fetish of originality, but who probably never did anything original in his life.

H. Vickers, Ph.D., M.Eng.

Vancouver, Canada, *October 30th*, 1925.

The reviewer of Dr. Vickers's book regrets that his review was unsigned, but Dr. Vickers may rest assured that the only reason for the reviewer's name not appearing is because it is not the custom of the Electrical Review to publish signed reviews. The review was written to enable intending purchasers to understand what they were likely to get for their money. If anything, the reviewer thinks that he was rather generous to the author, in view of some of the defects to which attention was drawn.

The Reviewer.

The Metering of Three-phase Power.

In the second paragraph of his letter commenting on Mr. Malcolm's interesting article, Mr. Jaques makes a grave charge against the supply undertakings when he states that inaccurate systems of metering are frequently employed, *many* of them being unfair to the consumer. Later in his letter he cites a case 15 per cent. against the supply undertaking. Can he give us any figures to substantiate his statement?

Referring to the problem of the correct meter for a three-phase four-wire supply, I would point out that the meter engineer has to decide which of the available apparatus on the market will give him the best results at a rational cost. Mr. Jaques will probably agree that three single-phase meters will do this. If it is necessary to measure the kW demand as well as the energy, then it will be necessary to use a three-phase four-wire meter, and whilst I agree that it is desirable to approximate as closely as possible to the three single-phase meters, one has to bear in mind that there are very few three-element meters on the market which are fitted with demand indicators and that interaction between the elements is an important source of error—in spite of what makers' pamphlets say—and these errors tend to be greater in a three-element meter than in a two-element meter. Mr. Jaques must give the meter engineer credit for knowing what he is about, and if he installs a two-element four-wire meter it is because he knows the circuit conditions and considers that he is getting the best possible all-round accuracy.

Whilst dealing with this subject may I be allowed to extend the scope of this discussion still further by pointing out that there is not a maximum-demand indicator on the market which comes within the limits of error specified in the B.E.S.A. Meter Specification; and I doubt whether any of them will come within the limits of error specified in the B.E.S.A. Instrument Specification.

As a meter engineer I am more concerned about inaccuracies in maximum-demand indicators than about two-*versus* three-element, three-phase, four-wire meters.

A Meter Superintendent.

November 17th, 1925.

I am glad that Mr. H. Hugh Jaques endorses my plea for accurate metering, and agree with him that the subject is one which does not always receive the attention and thought it merits. However, I think he will concede that supply engineers are gradually discovering the error of their ways as the errors of their metering systems come to light, and every day the "link with the consumer" is emerging from the ignominious position it once held to one of comparative and due importance.

I am sorry Mr. Jaques was disappointed in the scope of the article in question, but would point out that it was not intended to be a complete treatise on the subject, but merely a demonstration of the effect of various common abnormal conditions which can, and do, arise in everyday three-phase industrial power practice.

With regard to the metering of three-phase four-wire supplies, the use of the "three-element" type of meter is certainly preferable, but the cost is generally prohibitive, and is usually considered out of proportion to the benefits to be obtained. As the subject, however, is one on which opinion is still divided, investigation is indicated, and I propose to carry out experiments in this direction at an early date.

London, *November 17th*, 1925. **Geo. D. Malcolm.**

The Cost of House-Wiring.

In your issue of November 13th there is a letter by "Inquirer," entitled "The Cost of House-wiring." Writing from practical experience as a wireman, the average number of points complete per day for an eight-hour day for wireman and mate is four points a day. That is working in an occupied house, which means the shifting of furniture and raising of oil cloths, &c., and using slip tubing and cable.

November 16th, 1925. **Wireman.**

Buy All-British Goods!

I have been very much impressed lately with the admirable slogan that many firms are using, *viz.*:—"Buy British goods and thus support home industries," and it has made me wonder to what extent many who use this axiom act up to it in its entirety.

This calls for the further question what percentage of the component parts of an article can be purchased abroad and yet allow the complete article to be marketed as of British manufacture. It is much too large a field to be covered in a brief communication, but to illustrate the point we will take, say, a wireless intervalve transformer. Apart from the labour, this article consists of two main components: (1) the wire with which the coils are wound, and (2) the laminations which compose the iron circuit.

Now it does seem to me that a transformer wound with wire manufactured in America, or on the Continent, is not essentially a British transformer, although it is a "Transformer assembled in Britain." I believe members of the N.A.R.M. have very rigid regulations as to the supply of only British goods, and I am wondering if it is compulsory that these goods must be made of entirely British components. I certainly would not go so far as to say that the metals from which the components are made should be mined in this country, but I do think that we in Britain can handle their conversion.

Doubtless many manufacturers and traders purchase items from British wholesalers, in the genuine belief that they are getting entirely British-made articles, whereas it may be that the wholesaler himself is purchasing from a foreign source.

Prescot, *November 19th*, 1925. **James Nelson.**

British Industries Fair.

Your leader suggesting an Electrical Section is timely, and we would attend if the Electrical Section were in London. We have once exhibited at Birmingham Fair, but the Castle Bromwich site is very inconvenient as compared with the White City site for London. Besides, all foreign visitors go to London and only a portion go to Birmingham.

It would be much better to amalgamate and hold the joint exhibition in London.

Manchester, *November 23rd*, 1925. **J. D.**

The Licensing of Electric Wiremen.

Permit me, please, through your "Correspondence Columns," to express my gratitude that at least one nation (or should I say one Dominion) is endeavouring to protect the genuine electrical wireman.

I refer to the paragraph on p. 836 under the heading "Notes from New Zealand," which states that all electrical wiremen will have to pass a test; I think (and I am sure a good many contractors do) that something of the kind ought to be done in England, for there are numerous men to-day who cannot carry out the work necessary to comply with the rules of the I.E.E. The Rules, I think, are not too severe, considering the danger that can be caused by unqualified men, who cannot claim the union rate of wages because they are incompetent; but who, on the other hand, are employed by some contractors who are cheap-jacks, and would have to raise the price per point should they employ genuine electrical wiremen. I think more than myself will endorse the idea of New Zealand.

Stacksteads, *November 23rd*, 1925. **Joshua Rose.**

Legal.

Bartholomew v. Electrical Distribution of Yorkshire, Ltd.

ADJOURNED from October, the hearing was concluded at Rotherham County Court last week of a claim for £35 damages by Thomas Bartholomew, a carting contractor, of Rotherham, against the Electrical Distribution of Yorkshire, Ltd. It was stated that the defendants, having laid a cable, had left a road in a dangerous condition. Plaintiff said that when he was driving his 'bus over the trench the jolt was sufficient to break his rear axle.

His Honour Judge LIAS gave judgment for the plaintiff for the full amount.

Metropolitan Water Board v. North Metropolitan E.P.S. Co., Ltd.

MR. JUSTICE ROMER, in the Chancery Division on November 19th, had before him a summons taken out by the Metropolitan Water Board asking for a declaration that upon the true construction of the Electricity Supply Act, 1919, the Minister of Transport had no power to make an order authorising the North Metropolitan Electric Power Supply Co., Ltd., to abstract any water from the King George reservoir at Chingford, the property of the Board.

Mr. F. H. MAUGHAM, K.C., for the plaintiffs, said the point was whether a reservoir of a body of water was a "source" or not within the meaning of the Act, in which power was given to electrical undertakings to take water from "any river, stream, canal, inland navigation, or other source." It was a matter of great importance to the Board because if water could be taken from a reservoir it was difficult to see what could prevent its being taken from a main. If it had been intended by the section to give the word "source" as wide a meaning as the SolicitorGeneral must contend for, was it not plain that there would have been some provision for the protection of the water authorities? Not a single gallon of water could be taken from a dock without the consent of the owners, and the Crown did not intend to authorise the Minister to make an order which might deprive the Board of millions of gallons of water every day. The Board was at the greatest stress at some parts of the year to supply the needs of the public, and the smallest variation in the temperature of the water returned to the reservoir would have the most serious effect on the carrying out of its statutory duties.

The SOLICITOR-GENERAL said it was true that the Minister of Transport had the power to make such an order as was in contemplation, but his Lordship must take it that he had not arrived at any considered opinion as to whether the order was likely or ought to be made. He first of all wished to hear the objections which might be raised to the proposal to make such an order against the Board, and these would all be laid before the Minister at the inquiry to be held. But he wanted his Lordship's guidance and decision to govern, not merely that case, but others that might arise in different parts of the country. There was no appeal from the decision of the Minister, but he was at liberty to impose what conditions he liked as to the utilisation and return of water. This case turned upon the question of the interpretation of a particular word and not upon the merits of this particular proposal. The Minister had power to make an order, but it was also within his power to say: "I will make the order if you will do such things as are reasonable to provide compensation to the person whose water you are taking." He (Counsel) contended that the word "source" covered a natural sheet of water such as a lake as well as a body of water partly natural and partly artificial.

His LORDSHIP said he would take time to consider his judgment.

Marconiphone Co., Ltd., v. British Portable Radio, Ltd.

THE petition by the Marconiphone Co., Ltd., for an order for the compulsory liquidation of British Portable Radio, Ltd., was dismissed by Mr. Justice Romer in the Companies' Winding Up Court on November 17th.

Counsel for the petitioners said that the respondent company had paid them out and there were two other creditors whose debts had also been paid and the costs provided for.

Automatic Telephone Patents Extended.

IN the Chancery Division on November 18th, Mr. Justice Tomlin heard the petition of the Automatic Telephone Co., Ltd., Liverpool, for the extension of the period of six patents relating to improvements in telephone systems, on the ground that the applicants had been unable to work the patents during the war.

Mr. COURTENAY TERRELL, for the applicants, said that the patents which would in the ordinary course expire in January next, related to automatic telephones. The company was incorporated with a large capital to acquire patents from the Automatic Telephone & Electric Co., of Chicago. He asked for an extension of six years—an unusual extension—because the invention required an enormous amount of plant, and immense experience, and was one which would be chiefly used by the Government.

His LORDSHIP granted an extension of five years.

Damages Against Accrington Corporation.

AT the Accrington County Court, on November 20th, Messrs. H. Nuttall & Co., brewers, were awarded £11 13s. 6d. damages in respect of injury to a lorry by one of the Accrington Corporation's tramcars. A counter-claim by the Corporation for £106 for damage to its tramcar failed.

London Electric Supply Corporation Summoned.

AT the Greenwich Police Court, on November 23rd, Mr. Dummett continued the hearing of a summons against the London Electric Supply Corporation, Ltd., for failing adequately to protect an e.h.p. transformer, in consequence of which an employé was killed.

It was stated in evidence that an earthing device failed, and the employé, named Harwood, was sent to rectify it. He was found later dead inside the transformer cage with burns

on two fingers. The pressure on the transformer was said to be 10,000 V, but Mr. Hillbery, defending, said that if that had been the case Harwood would have been burned up.

Mr. SCOTT RAM, Electrical Inspector of Factories, said that the terminals might have been enclosed to render them safe against accidental contact.

The company's defence was that the enclosing of the transformer in a cage was sufficient protection.

Mr. Dummett reserved judgment.

De Laval, Chadburn Co., Ltd., v. Empson Centrifugals, Ltd.

IN the Chancery Division on November 19th, Mr. Justice Astbury had before him a summons taken out by the defendants in the action of De Laval Chadburn Company, Ltd., against Empson Centrifugals, Ltd., asking to strike out the plaintiffs' statement of claim on the ground that it disclosed no cause of action, or, alternatively, to strike out certain passages from it as tending to prejudice the fair trial of the action and as being embarrassing and irrelevant.

Mr. Macaskie appeared for the defendants, the applicants, and Mr. Warwick Draper for the plaintiffs, the respondents to the summons.

His LORDSHIP said the statement of claim alleged that the plaintiff company was incorporated in 1923 for the purpose of carrying on the business of designers, manufacturers and merchants of and dealers in centrifugal and other separators for all or any purposes and was the selling agent and concessionaire in the United Kingdom for the well-known and successful centrifugal oil purifier machine known and described as the De Laval centrifugal oil purifier. In September, 1923, the defendant company was formed by A. W. Empson for the purpose of manufacturing and dealing in centrifugal oil purifiers. Mr. Empson is managing director of the defendant company. On December 5th, 1924, there appeared in the ELECTRICAL REVIEW an article by H. D. Jukes, who (his Lordship was told) was an independent investigator, and who in his article made a report recording the results of a series of tests made by him with the oil purifier of the plaintiff company. The report (said the judge) was then set out at considerable length and it detailed certain results obtained by Mr. Jukes. Whether the plaintiffs could obtain better results from their machines or whether Mr. Jukes was right or wrong in what he said did not appear. The statement of claim went on:—On February 6th and 20th, 1925, the defendant company inserted in the same REVIEW an advertisement of their goods and the statements complained of in the advertisement were then set out in full. The first was "Insulating oil treated in the Empson centrifugal oil purifier (that is the defendants') has been exposed to the atmosphere for three weeks and still had a B.D.V. of 56 K.V." The next sentence was: "Compare this with a report recently published concerning another method of centrifugal purification which showed that while the oil left the machine with a B.D.V. of over 50,000 volts it fell to 38,000 volts after standing for about 48 hours in a closed tank." That was a reference and an accurate reference to part of Mr. Jukes's report. The next sentence complained of was: "The efficiency of a centrifugal oil purifier cannot therefore be judged solely on rate of flow and B.D.V. straight from the machine." That was the whole cause of action alleged—the insertion of this advertisement which made a certain statement as to the efficiency of the defendants' machine and compared it with the report made not by the plaintiff company at all but by an independent writer in the ELECTRICAL REVIEW. The cause of action alleged by the plaintiffs was then attempted to be stated: "By the said advertisement the defendant company referred and were understood by the readers of the same to refer to the said report of the said H. D. Jukes and the said oil purifier of the plaintiff company and meant and were understood by the said readers to mean that the plaintiff company's oil purifier was inferior and ineffective. The said advertisement of the defendant company was an inaccurate and unfair paraphrase of or allusion to the said report on the plaintiff company's oil purifier and defamatory of the plaintiff company in their business. By the said advertisement which was in fact read by many persons whose names are unknown to the plaintiff company, the defendant company has falsely and maliciously published a libel upon the plaintiff company in their business in oil purifiers. Notwithstanding a protest sent to the defendant company by the plaintiff company's solicitors on April 7th, 1925, the defendant company threaten and intend to continue the publication of the advertisement complained of or other advertisements or words containing similar unfair and defamatory allegations. By reason of the premises the plaintiff company have been injured in their credit and reputation and have suffered damage." Then an injunction was asked for, to restrain the defendant company from printing, publishing, issuing and distributing the statement contained in the advertisement or any similar statement referring directly or indirectly in any unfair or defamatory manner to the plaintiff company's oil purifiers to the prejudice of the plaintiff company; and damages and costs were asked for.

This statement of claim contained two alleged causes of action, an alleged slander of the plaintiffs' goods and an alleged libel on the plaintiff company. So far as it alleged slander he was of opinion that it disclosed no cause of action and ought to be struck out. As to the alleged libel there was nothing in the defendants' advertisement which was any libel at all. It was the commonest thing in the world for one trader to advertise that his goods were better or more efficient than any other and the Courts had said over and over again that that disclosed no cause of action. Mr. Draper apparently fe ing the force of these criticisms, had attempted to suggest th what the plaintiff company really wanted was to obtain injunction against some sort of unfair competition, but the junction that was asked for was solely confined to the repe tion of the advertisement complained of and similar adverti ments, and it was quite impossible to read that as asking relief otherwise than such as could be based upon allegatio in the statement of claim. The statement of claim disclos no cause of action and it must be struck out. The costs wou be the defendants' in any event.

Mr. Draper asked for and obtained leave to appeal.

Published Specifications.

Compiled expressly for this journal by Patent Agents.
The name of the applicant's patent agent, if any, will be found on the prin specification.
The numbers in parentheses are those under which the specifications will printed and abridged, and all subsequent proceedings will be taken.

Future Competitive Capabilities of Germany.

AN abstract appears in another part of our current issue of a report made by the Commercial Secretary to H.M. Embassy in Berlin, supplemented by further information prepared by the Commercial Secretary in the Occupied Territories at Cologne, regarding the economic, financial and industrial situation of Germany in 1924 and extending also for a few months into 1925.

The impression conveyed after a perusal of the general review by the Berlin Secretary is that a considerable improvement has taken place in that country. As he states, the currency question has been the fundamental cause of Germany's economic troubles, whereas the return to sound financial conditions has led to a marked general improvement.

A few questions which may be selected from this general review are of particular interest to Great Britain from the standpoint of competitive capability in the markets of the world. These relate to the problem of adequate working capital, the extension of the industrial works in recent years, taxation, organisation, and labour. As is known from recent capital transactions that have been projected, the problem of the possession of sufficient working capital remains the chief disadvantage under which the German business world has to labour at the present time. Truly some of the larger concerns have been able to increase their funds by the sale of industrial debentures, particularly in the United States, at rates of interest averaging 7 per cent., but the actual cost has been about 10 per cent. owing to bank commissions, &c. As the total amount of these issues, the Secretary says, is probably only about £100,000,000, much has still to be done in the matter of the provision of additional capital. Although this would appear to refer to the raising of further foreign capital, in his summary of the general review the Secretary seems to think that German commerce and industry will have to earn a large amount of working capital, and, in fact, he states that the creation of this capital must depend in the main on the exertions of the German people themselves.

On the second point—the productive capacity of the country—it is admitted that this has largely increased

during the period of inflation, but the Commercial Secretary is unable to say whether the augmentation has been 10, 20, or even 30 per cent. within the present frontiers, as compared with the same area before the war. It is, however, known that the output capacity of many of the iron and steel and machinery works in particular has been greatly augmented in recent years in order to compensate as far as possible for the losses in these directions through the cession of Alsace-Lorraine and a part of Upper Silesia. Concerning the social burdens placed on employers, as represented by old age pension insurance, accident insurance, and unemployment relief, it is submitted that these charges do not weigh less heavily upon British employers.

We now come to a still more important question, and the vital point which differentiates English from German costs of production, namely, labour. We are told by the Secretary that the German workman receives considerably less than the wages of his English colleague and often works a longer daily shift; he also works unremittingly, except for the usual pauses, during the whole of the time, unhampered by trade-union restrictions as to the quantity of his output. In the aggregate this system must make an enormous difference, although the German workman has only in a few instances returned to piece work. Unless some adjustment is made, the Secretary states that the effect of this difference will make itself increasingly felt according as the disadvantages from which Germany at present suffers, particularly the financial one, disappear. It may be that this is the reason why foreign manufacturers, not only those of British nationality, who have visited the country during the past year and have looked into matters themselves, are said to have been one and all amazed, not at the amount of German competition which they experience, but at the fact that it is not greater. Of course, the chief reason why this rivalry is not more severe is, as already pointed out, mainly the financial difficulty under which German trade is at present suffering.

The danger of over-production and excessive protection seem to have been apprehended in some quarters in Germany, and in these circles the remedy advocated is the establishment of international "horizontal" co-operation, which means that the same branches of industry in the different countries should arrive at an understanding concerning output and prices. It is the only remedy, it is contended, for the universal coal crisis as well as for that existing in the iron and steel trades. As is well known, an international combine of this kind has been formed among the electric lamp producers of the world, and is said to work satisfactorily, and to provide an excellent example for other suffering industries to follow that are waging a war which can only result in the extinction of the contending parties. To this may be added that a somewhat similar arrangement has already been made in the potash industry as between France and Germany, and that in various directions in Germany it is suggested that an understanding should be reached between the producers of aniline dyes in that country and those in England, the United States, and other countries.

Under all the circumstances of the situation, and taking into account the augmented productive capacity of many of the industrial works and the determination to develop German activity, it is no wonder that the Commercial Secretary in Berlin states that in the future competition with England, labour will be the primary and organisation the secondary factor, while at the same time it is considered to be improbable that taxation will ever be heavier in Germany than in England, or even equally heavy.

The Report of the Electricity Commissioners.

The fifth annual report of the Electricity Commissioners, issued at the end of last week, arrived at a later period of the year than its predecessors. In their prefatory remarks the Commissioners review the conditions brought about by the intervention of the late and present Governments, which, whilst intended to accelerate the "intensive development" of electricity supply, has unquestionably been the cause of serious delay, and may not improbably continue to retard progress for many months to come. In accordance with the policy outlined by Mr. Snowden in July last year, the Commissioners retained Messrs. Merz & McLellan to report upon the question of a complete standardisation of frequency, and their report, with the Commissioners' recommendations, was submitted to the Minister of Transport a year ago. That report has not yet been published, although prepared, according to the Expenses account of the Commission, at a cost to the State of £4,206. The Commissioners were also authorised to confer with the I.M.E.A. and other bodies with regard to the formulation of main transmission schemes and a distribution system for rural supplies, but the change of Government brought the whole matter to a standstill, and there it has remained. As they somewhat pathetically remark, "while these important investigations preliminary to a decision on policy were in progress, the Commissioners necessarily felt constrained from proceeding with the initiation of new schemes of reorganisation," and, time and again, reference is made to this obstructive factor in the body of the report.

Hence the chief items upon which they can congratulate themselves were the concluding stages of the constitution of the Edinburgh and Lothians, London and Home Counties, East Midlands, and West Midlands Electricity Districts, and the issue of the two exhaustive Returns of Authorised Undertakers and Statistics which form so valuable an addition to the reference literature of electricity supply. Returns for the years 1923-24 and 1924-25 are to follow as soon as possible.

However, the routine proceedings of the Commission suffered no apparent diminution, and a vast amount of work was accomplished.

The total energy generated by electricity supply and traction undertakings during the year was 7,415.3 million kWh, an increase of 11 per cent. Returns were received from 584 power stations, of which three-quarters generated less than 10 million kWh each, and the Commissioners regretfully admit that they have been obliged to sanction the establishment of small generating stations in various parts of the country. However, since their appointment 54 small stations have been shut down and 21 relegated to the category of stand-by plant. The sales of energy increased by 15 per cent. to nearly 5,000 million kWh, out of 6,047 millions generated by authorised undertakers, or 117 kWh per head of population. This figure, however, does not include electricity used for traction or that generated at private stations, which, we believe, would bring the consumption *per capita* up to 250 kWh.

The proceedings in connection with the London and Home Counties Electricity District are fully set forth, though the Order constituting it came into operation after the close of the year under consideration. The capacity of the generating plant in the District installed or sanctioned at March 31st, 1925, amounted to 1,139,232 kW, of which local authorities owned 43 per cent. and companies 57 per cent.

Commenting on the West Midlands Electricity District, which was originally part of the North-West Midlands Electricity District as provisionally delimited, and which was constituted by an Order (subject to confirmation by Parliament) in April last, the Commissioners remark that this was the only instance in which the full support of the local authority and company undertakers was forthcoming to the establishment of a Joint Electricity Authority and to the transfer of the generating stations in the District to the Authority. It was also the first instance in which a Power Company surrendered its powers in a District in return for the granting of power to supply electricity for all purposes in other portions of its area. This is a measure of co-operation which does all parties credit; the failure of undertakers in other Districts to show a similar spirit must have been a bitter disappointment to the Commissioners.

The total capacity of generating plant for new stations and extensions sanctioned by the Commissioners during the year was about 480,000 kW, thus maintain-

ing the rate of growth in spite of the industrial depression. In some cases, of course, the new plant was to replace obsolete plant.

A number of consents were given for the establishment of main transmission lines at 33,000 volts, and two for 66,000 volts (County of Durham Electric Power Supply Co. and North Wales Power Co.).

Special Orders were made in respect of 66 applications; at the beginning of the year 74 applications were under consideration, and 88 were received during the year. The amount of loans sanctioned was £13,379,060, an increase of 37 per cent., mainly for plant and mains. Glasgow Corporation received sanction for a loan of £1,850,000, and Birmingham Corporation for £1,049,851, for extensions.

The expenses of the Electricity Commission amounted to £47,134; the final instalment of £23,000 in repayment of advances from H.M. Exchequer was paid, and the amount to be apportioned amongst authorised undertakers was £67,000.

The Electrical Trade at Birmingham.

As we have already directed attention to the desirability of firms in the British electrical trade being reasonably in evidence at the Birmingham Section of the British Industries Fair in February next, we need say little now beyond urging them to come to a quick decision. There is still time enough for a trade dispay of a thousand and one electrical articles to be brought together, and the cost per company or firm need not be such as to trouble any of them. Elaborate exhibits are not necessary, but a simple and businesslike collection of apparatus, switchgear, small motors, lamps, cables and wires, appliances, devices, fittings of all kinds, instruments, accessories, and so forth, can be brought together to form an electrical market humming with trade activity, which during twelve days would impress not only the Colonial and foreign visitors who are coming, but also all those home concerns which are taking part in the Fair as exhibitors, not forgetting the trade association visits that we understand are being arranged. Surely the effort and the small cost could hardly fail to be well worth while. Let us give it a real trial—make part of the Fair an electrical market-place for 12 days!

Continental Competition.

Information contained in a Wellington dispatch to *The Times* will be welcome in this country, for it illustrates the depth of the desire of the New Zealand Government to encourage the importation of British manufactures. The Government, it is stated, has raised from 25 to 50 per cent., the proportion of British material incorporated in British goods to entitle them to enter under the preferential tariff arrangement. Other news that lies before us is far less welcome, for here at home, where one might with even greater reason look for assistance to be given to British production, we have certain public authorities placing orders abroad. Morecambe Corporation Electricity Committee has authorised the purchase of Continental electric meters because British manufacturers are stated to have "formed rings to protect their prices." The Hull Telephones Committee has accepted tenders for German-made cable and bronze wire, though some members reminded their colleagues that it was economically unsound to send work abroad when unemployment and high taxation prevailed at home. It was remarked that if the lower tenders were not accepted the Council would play into the hands of "rings." We turn to Glasgow for relief, for while the Tramways Committee by a majority inclined to accept a tender for German trolley wire, the Corporation subsequently gave the order to a British firm. In this instance it was explained that deliveries from the Continent were irregular, and as the present material was urgently required and could be supplied within seven days by the lowest British tenderer, the difference between £984 and £1,051 was not sufficient to justify adding to German employment and preventing the reduction of British unemployment.

In discussing the recommendations of the committees that have been recently making inquiries under the Safeguarding of Industries Act, the *Daily Telegraph* remarks:—

"There is a ground for believing that a considerable proportion of the unemployment which now exists in our midst can be traced to the unfair basis on which many foreign manufacturers compete with us in this country. They are able to carry on their industries under conditions which trade union leaders here would be the first to denounce. We are urged by every consideration to do all in our power to ensure that the British workers have at least an equal chance with the foreigners in supplying our own needs."

This should be the policy controlling the action of all who have public contracts to place in these days. To argue that we shall facilitate the re-establishment of international relations by placing orders abroad, as was done in one of the above cases, is to ignore the immediate interests of the workless million.

Overhead Lines.

Over twenty years ago French Government engineers had sufficient intelligence and foresight to realise that the advantages of electricity supply to the community in rural areas must outweigh the risk to the public on the highways, and possible injury to æsthetic amenities, so a law was enacted under which wayleaves for aerial lines alongside public roads in the country could be obtained at a small fee per post and per kilometre. As far as danger to the public is concerned, in the past our Whitehall bureaucrats strained at electrical gnats whilst swallowing, with ballot-box expediency, the motor traffic camel. The existence of so many miles of roadside power lines in rural districts has not apparently interfered with the tourist traffic in France, Italy, or Switzerland. It should be remembered, however, that in general the roads in France are wider and straighter than ours.

Reference was made by Lord Weir, in his speech at the Beama dinner, to the necessity of facilitating wayleaves for overhead lines, and as we have shown, it is fully recognised by leading authorities in the electricity supply industry, including the Councils of the I.E.E. and the I.M.E.A., that for the purpose of rural supply the existing regulations are unduly restrictive, to say the least. It is interesting to note in the Report of the Electricity Commissioners, mentioned above, that reference is made (p. 58) to the rights of the Postmaster-General in this respect, and a communication received from him by the Electricity Commissioners in August, 1923, is summarised. From this it appears that the Postmaster-General, as an act of grace, bears half the cost of protecting Post Office lines erected after those of authorised undertakers, the whole cost of fuses and heat coils, and the whole cost of a concrete partition between underground mains. The communication went on to say that Parliament had recognised "the danger inseparable from the presence of electricity power and supply undertakings on the public roads," and had required that precautions should be taken for the safety of other users of the roads; had provided for the protection of telegraphs and telephones; and had charged the Board of Trade with the duty of safeguarding the public. Presumably the word "undertakings" stands for lines.

Regarding this communication, we may point out that the Post Office has nothing at all to do with the safety of the public; its duty is to look after its own property and that alone. In our issue of September 28th, 1923, we printed an important article by Mr. W. H. Stoker, K.C., on the legal powers of the Postmaster-General, reference to which will show that compliance with his "reasonable requirements" is required by law, and that if his requirements are regarded as unreasonable—or disregarded—the difference of opinion is to be *settled by arbitration*. Undertakers should bear this in mind when they are confronted with stipulations which call for the erection of a so-called "safeguard" costing hundreds of pounds.

Electrical Christmas Gifts.—II.

Some Notes and Suggestions.

In our last issue we put forward a number of suggestions for Christmas presents which we hope have stimulated electrical dealers to a proper appreciation of the opportunities which occur at this time of the year. In the present article several more appliances are illustrated, most of them, perhaps, of more familiar appearance but none the less (or perhaps all the more) useful on this account.

Fig. 22.—The "Revo Junior" Loud Speaker.

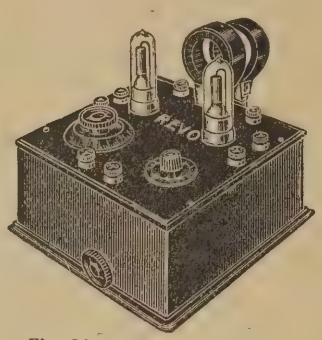

Fig. 23.—The "Revo Magna" 2-valve Set.

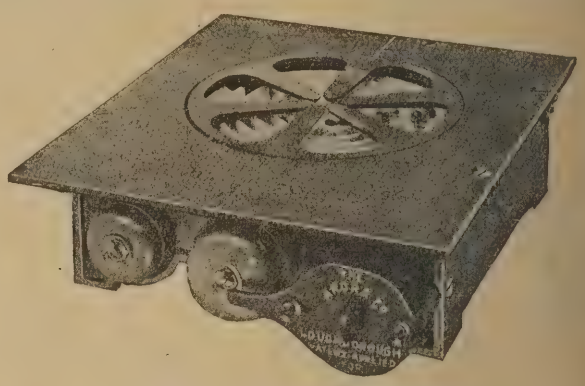

Fig. 24.—An "Arora" Boiling Plate.

Fig. 25.—The "Siemens Xcel" Vacuum Cleaner.

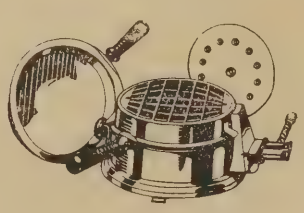

Fig. 26.—A Table Cooker.

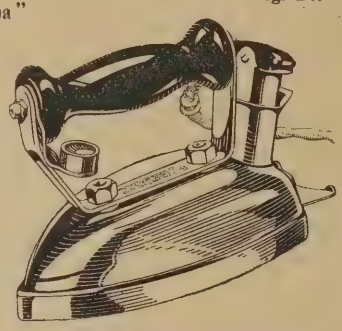

Fig. 27.—An "Xcel" Electric Iron.

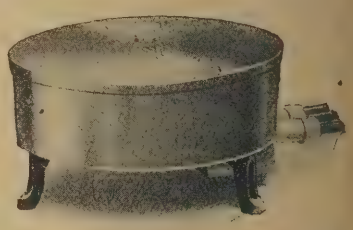

Fig. 28.—A "Carron" Boiling Plate.

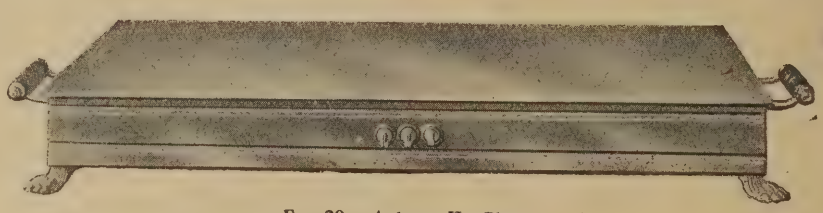

Fig. 29.—A large Hot-Plate.

Fig. 30.—A "Tricity" Shaving Pot.

We briefly referred in the preceding article to the assistance which is offered to sellers of electrical appliances by the British Electrical Development Association, and we have since received some new matter from that

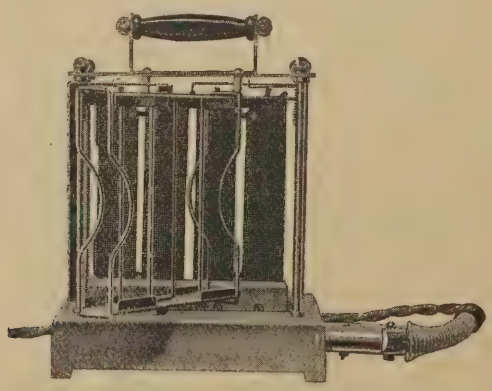

Fig. 31.—A "Creda" Toaster.

body which indicates the directions in which custom should be sought. One of the most effective means of drawing attention to electrical goods is the insertion of a seasonable advertisement in the local newspaper. For a very reasonable sum, printing blocks of very compelling advertisements can be obtained from the E.D.A. These are so arranged that matter appropriate to the particular locality in which they appear can be used with them. In this way local dealers can exercise their ingenuity to make the advertisements do the maximum amount of work for them. The bulk of the advertisements supplied by the E.D.A. deal with the question of Christmas presents from the "opposite sex" aspect. That is to say, they suggest to women what electrical gifts are likely to appeal to men, and to men what are considered appropriate presents for women. The most apt "slogan" contained in a booklet on Christmas presents which is being distributed by the E.D.A. is: "If there is a switch in your friend's house, or your own, your present should be electric." It is pointed out that electrical presents are up-to-date, useful, and practical. "Many of them weave themselves into the daily life of the recipients until the festive season comes round again, and indeed, for any of them a hundred useful commissions will be found for them in the course of the year."

So far we have treated the matter from the retailer's point of view, but we realise that a very great proportion of our readers are not retailers. Nevertheless, they are all givers of Christmas presents, and we would appeal to them to give electrical appliances first preference when choosing their gifts. In this way they will do their part in popularising electrical devices to the ultimate good of the whole of the industry, including themselves. If appliances are sold in increasing numbers, orders for generating plant, cables, &c., will be a natural consequence.

We would conclude this introduction with just one more reminder to dealers not to forget the potentialities of good window dressing during the Christmas season—and always.

Although in our last issue we illustrated many appliances which could be appropriately presented as Christmas gifts, the possibilities were far from exhausted. The suggestions sent in by manufacturers cover a very wide field, and we are thus enabled to give a further selection in this issue. As we have said, radio apparatus makers offer a large variety, and we depict two typical productions of the Cable Accessories Co., Ltd. The first (fig. 22) is a loud speaker, one of a number of patterns made by the company, this particular example being the "Revo Junior" type, which has an aluminium flare and is finished in black enamel and nickel plate. Fig. 23 illustrates the "Revo Magna" two-valve set, which is supplied complete with all accessories. A dual rheostat is fitted to enable either bright or dull-emitter valves to be used.

The boiling plate illustrated in fig. 24 is a product of the Arora Co. It has three sector-shaped elements, each of 500 W and the switching arrangement enables the whole of the loading to be used, or 1, ½, or ¾ kW as required. For the lowest heat the interlocking slide seen in the illustration is moved to the left. The appliance has a matt black finish.

There are many types of vacuum cleaner on the market; a typical machine is the "Xcel" pattern (Siemens & English Electric Lamp Co., Ltd.), shown in fig. 25. This can be provided with a number of accessories for various cleaning purposes. Another appliance supplied by the same company is the table cooker depicted in fig. 26. This is made with a single "heat" (600 W), or with three "heats"—250, 450 and 650 W. All manner of small cooking operations can be carried out with this device. Another example of electric iron is among the suggestions received from the company; this is illustrated in fig. 27.

A plain but well-designed boiling plate of the solid type is shown in fig. 28. This appliance is made by Carron Company in a number of patterns. Two ranges of loadings are provided, *viz.*, 600/750 W and 1,000/1,250 W. If desired, the larger sizes can be fitted with 3-heat switching.

The Credenda Conduits Co., Ltd., manufactures a wide range of domestic electrical appliances and a few examples are illustrated. Fig. 29 is a capacious hot-plate on which a number of dishes may be placed to be kept warm. It has a handsome finish which makes it a suitable appliance for the dining table and the elements are controlled by three snap switches. Another form of toaster is shown in fig. 31. This has a swinging reversible bread holder and a heat insulated handle. Fig. 32 is a familiar appliance, an electrically-heated saucepan. The article illustrated in fig. 30 is intended by its makers, the British Electric Transformer Co., Ltd., as a shaving pot, although the larger size (one pint, 400 W) has many other uses. It is made in copper and has a nickel-plate finish. This company also makes a warming plate for the table (fig. 33) of rather different design from that just mentioned. This is circular in shape, with a 60-W loading, and mounted on three legs. Its diameter is 7 in.

A loud speaker of very recent design, but already proved efficient, is the "Kone" pattern, illustrated in fig. 35, which is made by Standard Telephones & Cables, Ltd. (formerly the

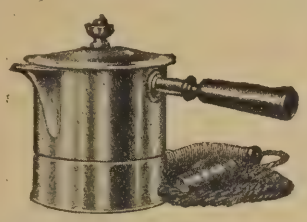

Fig. 32.—A "Creda" Saucepan.

Fig. 33.—A Tripod Warming Plate.

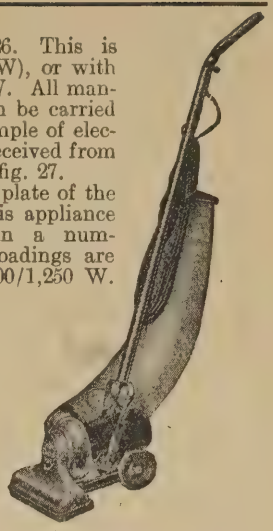

Fig. 34.—"Western Electric" Vacuum Cleaner.

Fig. 35.—The "Kone" Loud Speaker.

Fig. 36.—A Coffee-percolator Set.

Fig. 37.—A "Cosmos" Kettle.

Fig. 38.—The "Utility" Cooker-radiator.

Fig. 39.—"Cosmos" Boiling Jugs.

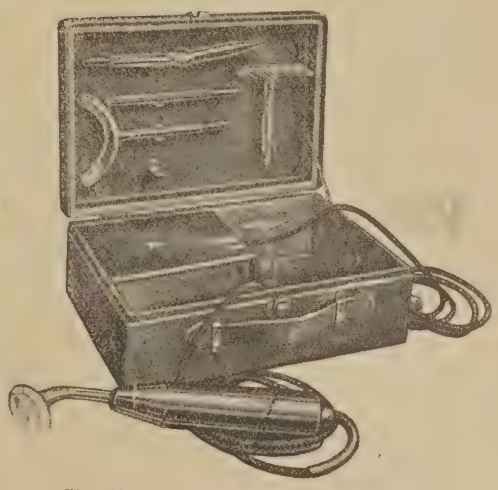

Fig. 40.—"Provita" Violet-Ray Apparatus.

Fig 41.—A "Belling" Iron.

Fig. 42.—A Combined Boiler and Griller.

Western Electric Co., Ltd.). The versatility of electrical manufacturers is exemplified in this case, the following articles being of a very different nature. Fig. 34 shows the "Western Electric" vacuum cleaner; while fig. 36 depicts a coffee percolator which is supplied by the company complete with a cream jug and sugar basin.

Another company of widely-separated activities is the Metropolitan-Vickers organisation. Although makers of the heaviest electrical machinery, they realise that the consumer is the most important unit of the electrical world, especially the domestic consumer. Hence they also produce numerous household appliances which are marketed by Metro-Vick Supplies, Ltd. Two examples are illustrated; the first (fig. 37) is a domestic kettle, and the other (fig. 39) a pair of boiling jugs of different patterns.

The device illustrated in fig. 38 serves a double purpose. Set vertically, as depicted, it is an electric heater. When placed in a horizontal position it can be used for a number of minor cooking operations. Below the elements is a space which will take a grilling dish, and a baffle plate is provided to cover the top of the elements and direct the heat downwards. The top plates are of polished aluminium, and the frame is of substantial construction. These units can be combined in pairs, threes, or fours to form efficient cookers, and the makers (Electrical Utilities, Ltd.) also provide an oven for use with these combinations.

One of the advantages of electric cooking appliances is their extreme portability; they can always be put into a convenient corner or on a table, and can be easily moved to another room if necessary. This must be our excuse for reproducing a view of yet another small cooking appliance (fig. 42). This combined boiler and griller is made by Messrs. Belling & Co. The boiling plate can be used as an open- or totally-enclosed ring, the element having three-heat control. The boiling plate cover acts as a baffle when it is required to do grilling in the "ovenette" which forms the body of the appliance. Another Belling product is the "Dinky" iron shown in fig. 41. This is a light-weight pattern with a detachable connector, with enclosed contacts, and a back rest.

Whether the effects of "violet-ray" apparatus are actually physical or merely psychological is still doubtful, but all the same it *has* effects and there is a demand for it. The "Provita" equipment supplied by the Qualitas Co., Ltd., and illustrated in fig. 40, is a good example of its kind. The generator and electrodes are contained in a leatherette velvet-lined case measuring 14 in. by 8 in. by 5 in. Five electrodes are provided—a surface "applicator," a comb electrode, an external throat electrode, a "saturator," and a rectal applicator. Several other sets are available, and there is a wide range of electrodes.

We conclude this article with an appliance of rather a larger nature than the foregoing, a "Creda" cooker (fig. 43) made by the Credenda Conduits Co., Ltd. The type illustrated is suitable for a family of from seven to ten persons. The exterior wiring and fuses are enclosed in a switchbox at the side; there is a lock on this to prevent any tampering by the children. The elements are arranged around three sides of the oven and the latter is bodily removable for cleaning purposes. The top of the appliance is fitted with two open-protected boiling plates and a 10 in. by 10 in. three-heat grill. The oven walls are double cased and lagged and the front and door are of substantial cast-iron construction. The oven loading is 2,000 W, and that of the hotplates and grill 1,500 W each.

Fig. 43.—A "Creda" Cooker.

The Electrical Trade and the British Industries Fair.

A Meeting at Birmingham.

Representatives of some of the British electrical trade organisations and the Press of the industry attended on Tuesday last week at the Birmingham Chamber of Commerce, whose Council had extended to them an invitation to visit Castle Bromwich Aerodrome—the venue of the Birmingham and Midland section of the British Industries Fair, which will again be held early in the New Year (February 15th to 26th).

Following an inspection of the aerodrome, the party lunched at the Chamber of Commerce with members of the Council of the Fair, with whom, as last year, the Birmingham Corporation is again actively co-operating in the work of organisation. The president (Mr. H. E. Parkes) presided, and supporting him were Mr. R. C. Rodgers, the chairman of the B.I.F. (Birmingham) Committee, and Mr. T. R. Martin, the vice-chairman (of the firm of Messrs. J. H. Tucker & Co.). The president accorded a welcome to the party, and invited their co-operation in assisting to make the forthcoming Fair as great a success electrically as it promised to be in other ways. The sole aim of the Birmingham Chamber was in every possible way to help British trade and commerce; and they were most anxious that the great electrical industry of the country should be adequately represented. Last year the representation was anything but satisfactory. That state of things they desired to alter, for they would recognise that it was very disappointing to many overseas buyers if anything were lacking in the electrical section.

Several letters of interest were read by Mr. Charles Stanley, the general manager of the Fair. Mr. R. A. Chattock, the chief electrical engineer of the Birmingham Corporation, wrote expressing his warm approval of the objects of the B.I.F.; they would have his warm support and co-operation in order to make the affair a great success. Mr. S. T. Allen, of the British Electrical Development Association, stated that he was strongly of opinion that the electrical industry should be adequately represented; and Mr. D. N. Dunlop (Director of the British Electrical and Allied Manufacturers' Association) wrote pointing out that nothing could be done this year in the way of bringing the Electrical Exhibition under the supervision of B.E.A.M.A. His view was that the only course open to the B.I.F. Council this year was to circularise the purely electrical firms in the "Beama," and to put the case to them as strongly as possible with a view to inducing them individually to take space. The letter to them should, if possible, give some idea of the total cost; of the expenditure to each individual firm; and if anything could be added as to the value of the Fair to electrical firms based upon their experience it would no doubt have a considerable effect.

Mr. R. C. RODGERS said it had frankly to be admitted that, whilst the Fair last year was very strong in some departments, the electrical industry was anything but satisfactorily represented. That was a source of surprise and disappointment to many overseas buyers, especially having regard to the efficiency and up-to-dateness of electrical manufacture. Already the advices received indicated that retail associations and other buyers of accessories, as well as shippers' associations, would be well represented. The gas industry had many stands, and it appeared that it would be to the advantage of the electrical industry, as well as to the trade of the country and the Empire, if manufacturers were prominently in evidence.

Mr. T. R. MARTIN pointed out that, whereas in 1924 the number of foreign buyers at his firm's stand was only 16, this year they numbered 191. It seemed to him that makers would find it good business to display their goods at the Fair for a series of years, for it was by such propaganda that enduring connections were built up. His earnest hope was that an appreciable addition would be made in the coming February to the number of electrical stands.

Mr. F. J. COLLIS, secretary of the Electrical Accessories Manufacturers' Association, said that, although he had no instructions from his members, the objects of the meeting had his sympathy, and the Council could rely upon him to do anything he could to further them.

Mr. F. HILARY JONES (a member of the Fair Council) stated he had recently been on an extensive overseas trade tour, and he assured them that in many countries, and especially in the Far East, very striking electrical developments were taking place. Although there was a good deal of competition from foreign countries, he was able to testify to the fact, from first-hand knowledge, that buyers were now realising that Great Britain was making a definite and very real attempt to recover her trade position. As to Canada, the domestic servant problem was more acute there than in this country: this meant increased reliance upon labour-saving equipment, and excellent scope for business in this domain was offered, especially if improvements could be made upon the American equipment. Having regard to the great manufacturing importance of Birmingham, he suggested that an excellent opportunity was now afforded for the display under one roof at Castle Bromwich of the electrical products of the industry.

Mr. A. H. BRIDGE (commercial editor of the ELECTRICAL REVIEW) expressed his sympathy with the movement to secure an effective electrical section at the Fair. His thoughts reverted to the fact that in the first years of the British Industries Fair no space could be afforded by the Board of Trade to the electrical industry. It was not until 1920, when the Birmingham Section of the Fair was started, that the electrical trade took a serious part in it. For a year or two the effort was fairly substantial, but subsequently, as they must remember, Wembley and the heavy cost of the magnificent electrical demonstration made there had occupied manufacturers' attention and their funds as well. Personally, he preferred the word "market" to "fair." The industry was well organised on the industrial side, and if by that exhibition the marketing and salesmanship sides could be developed, with effective propaganda work, which would serve to accelerate the rate of business, both home and overseas, real credit would be due to the Council. In 1920 and 1921, as he had said, there was a good representation of first-class electrical firms; but on each occasion he had to make his way among hardware and kindred goods in order to find the electrical products. The section was not properly organised, because it was no one's business in particular to organise it. While he was hopeful that the interests of the electrical trade would be well represented, it appeared to him that much better results would be secured if the trade, in its various phases, was housed together so as to afford facilities, in the easiest possible way, by which visitors could get in touch with the different classes of products. There were reasons for "a feeling of hopefulness" in the letter of Mr. Dunlop. If "Beama" could not do big things officially this time he was hopeful that many of the members individually (or perhaps the Association represented by Mr. Collis) would give their warm co-operation, as short as the time was, a show worthy of the electrical trade should be made in 1926. An industry with an invested capital of 600 million pounds sterling ought to have an adequate place in a great national trade event of this kind. The quality of the British product was extremely high and compared most favourably with the best of the manufactures of any country in the world. While he did not suggest that much should be done at the Fair in the display of large plant, he felt that there remained time during which arrangements could be made for comprehensive displays by the manufacturers of relatively small equipment. The manufactures of the members of the Cable Makers' Association were world-renowned for their high-class quality, and he thought that a collective exhibit such as they showed at Wembley, but of course on a small scale, would impress foreign visitors and do good to the industry.

Mr. JENNINGS, secretary of the Birmingham Corporation Electric Supply Department, pointed out that the City Council intended to give the fullest assistance to the Chamber of Commerce in the promotion of the undertaking, and so far as the display by electrical concerns was concerned, he gave the assurance that his Department was prepared to go far out of its way to assist. He hoped a concentrated effort would be made so as to ensure the creation of a real electrical section, in an area of its own. He agreed with Mr. Bridge that the British electrical industry—excellent as were its products—was somewhat lacking in marketing methods. The Americans were reaping the advantage of propaganda in various directions, and particularly in vacuum cleaners and other similar equipment. He suggested that a small committee should get to work to see what could be done to secure the industry's support.

It was decided to ask Messrs. Jennings, Martin, Collis, and Dunlop to serve on such a committee, with power to add to their number.

It was explained that there was a substantial block of space still available which could be allotted to the electrical trade where it could erect at small cost a number of suitable stands. The need for prompt action was emphasised in order to secure that space, but it was also remarked that representative collections of products to fill the simple stand or shop structures could speedily be brought together from stock.

Communications regarding space, &c., should be addressed to the Secretary, Chamber of Commerce, 95, New Street, Birmingham, or to the D.O.T. in London.

The Engineering Exhibits.

We are informed that one of the most satisfactory features of the forthcoming Fair (White City and Birmingham) is the return of numerous firms whose temporary absence during the previous two years was due to their concentration on the British Empire Exhibition. Though the two events were of an entirely different character, the Fair being essentially a trade display, many large undertakings found it impracticable to show at both; this was especially the case with engineering firms whose exhibits at Wembley throughout the summer months made considerable demands on both staff and plant. This temporary change of venue was bound to have an effect on the Birmingham Section, which deals in the main with the heavier classes of industry. It is noteworthy, however, that owing to the advent of new exhibitors, these groups were maintained at practically their former standards. Group No. 5 for instance, of the Birmingham Section, which comprises: Engineering plant; general machinery, machine tools; transmission and hauling appliances; foundry requisites; rolling mill plant; weighing, measuring, and testing instruments; and industrial equipment generally, occupied in 1924 and 1925 an area equal to that of any previous year. We are informed that it is now certain that next February, for the reasons indicated, the engineering exhibits at Birmingham will be at least three times as large as on any previous occasion.

More than 50,000 invitations to the 1926 Fair have been issued by the Board of Trade to buyers abroad, and we understand that analysis of the acceptances already to hand shows that those interested in engineering products will form a strong contingent.

Firms who wish to take space may know that ample provision has been made by the Corporation for power supply, but early application will greatly facilitate the arrangements necessary in cases where a supply is required.

We have not at hand at the time of going to Press a list of the electrical firms who have already taken space, but among the engineering exhibitors are:—Birmingham Small Arms Co., Ltd.; Blackstone & Co., Ltd.; Geo. Bray & Co., Ltd.; Coalbrookdale Co., Ltd.; Crossley Bros., Ltd.; Dennis Bros., Ltd.; Ford Motor Co. (England), Ltd.; Alfred Herbert, Ltd.; Lightfoot Refrigerating Co., Ltd.; Morris Commercial Motors; National Gas Engine Co., Ltd.; Nobel Industries, Ltd.; Relay Automatic Telephone Co., Ltd.; Ruston & Hornsby, Ltd.; Tangyes, Ltd.; Taylor & Challen, Ltd.; and Vickers-Petters, Ltd.

Canada and the Export of Power.—A prominent American hydro-electric expert recently read a paper which purported to show that it was to Canada's economic advantage to sell her surplus hydro-electric power to the United States. The opposite view was presented by Mr. Julian C. Smith, vice-president and general manager of the Shawinigan Water & Power Co., and his opinion is stated by the Toronto *Electrical News* to be "right and final." Mr. Smith showed that the interchange of commerce between the United States and Canada was decidedly in the former's favour. He also presented figures showing that although there was a temporary surplus, all the power which Canada could possibly develop would be required in from 15 to 20 years. Apart from this the export of power would aid Canada's competitors, low-priced power being a strong stimulant to new industries. Once power was exported immense vested interests would arise which would be powerful enough to prevent the stoppage of the supply when Canada required the power herself.

The Times reports that in a recent speech, Mr. Taschereau, Premier of Quebec, referring to the St. Lawrence waterways and other schemes, said:—"There are two things we will not have. One is that the waters of the rivers of this province be used to generate electric power for export to the United States; and the other that developments be carried out in the St. Lawrence River within our control that would injure the Port of Montreal." The Premier argues that the recent decision of the Privy Council established the principle that the bed of the St. Lawrence River belonged to the province as far as it is within the territory of the province. Therefore the international waterways project "cannot be carried through without the consent of the Government of the United States, of the Federal Government of Canada, and the governments interested in the Canadian provinces."

The Bradford Electricity Undertaking.

Some Recent Switchgear and Sub-Station Developments.

(*Concluded from page* 863.)

It was evident to visitors on the occasion of the inauguration of the new plant, which was described last week, that progress in the Bradford Corporation's Electricity Department had not been confined to the generating plant. The 17 metal-clad panels of Messrs. A. Reyrolle and Co.'s manufacture, comprising the main generating-station switchboard, one of which was operated by Sir John A. Snell, Chief Electricity Commissioner, when he switched in the new transformer and 49,500-volt transmission line to Thornbury, have a rupturing capacity of upwards of half a million kVA and are complete with duplicate busbars and automatic busbar indicating devices.

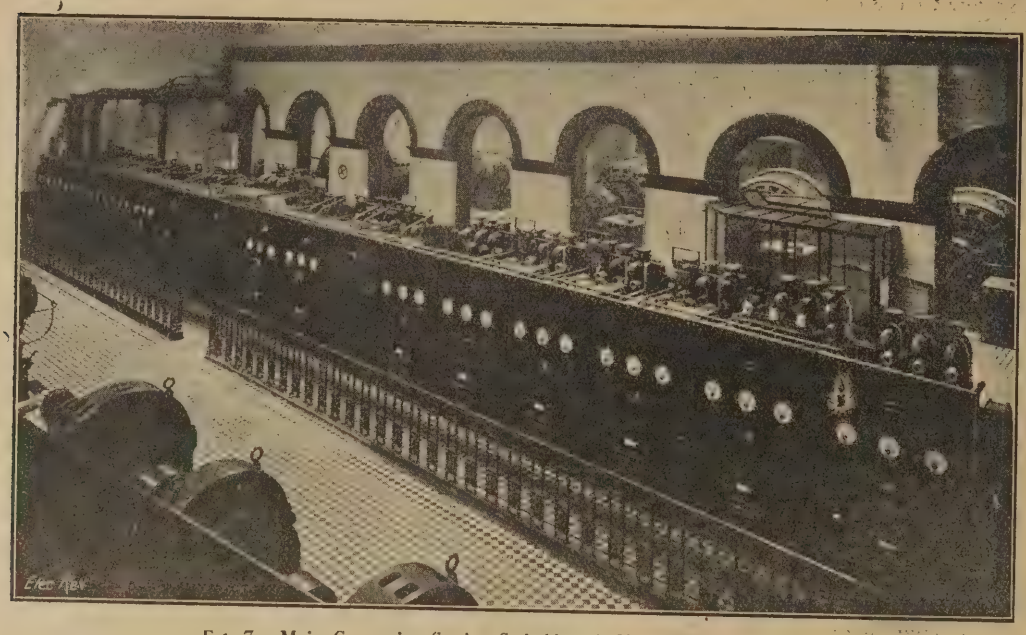

Fig. 7.—Main Generating Station Switchboard, Valley Road, Bradford.

The original installation, consisting of four panels, operated by hand wheels, at the back of a slate board as shown at the left-hand end of fig. 7, was installed at the Valley Road power station in 1921, and experience with it influenced Mr. T. Roles's decision to use metal-clad switchgear for extensions and to completely replace the existing cellular gear; fig. 7 shows the complete board to date, the extension panels at the right-hand end being electrically operated. The absence of the complete instrument equipment usually associated with generator panels, of which there are three on this board, is accounted for by the fact that an existing desk-type control board on the switch gallery proper was dismantled and re-equipped with the necessary instruments and controls, leaving only emergency operating devices and indicating apparatus upon the slate board shown in the first of the accompanying illustrations, fig. 7.

It is noteworthy that one of the panels on this switchboard, namely, that for the 20,000-kW generator, is the largest of its kind as regards carrying capacity ever manufactured in the metal-clad form, having a normal capacity of not less than 3,000 amperes at 6.600 volts. Moreover, all switchgear is consistently purchased for 12,000-volt operation, although the present operating voltage is 6.600 V. The distance energy has to be transmitted in Bradford and district has become too great for economical operation at the present pressure of 6,600 volts, and the pressure of 49,500 volts, it is claimed, is the highest which has yet been adopted for underground transmission by any municipal electricity undertaking in this or any other country. Two three-core cables, each conductor having a sectional area of 0.25 sq. in. of copper, have been laid between the Valley Road power station and the Thornbury sub-station, and in all probability they will be extended to other districts; one will act as a duplicate of the other, and each cable can transmit about 20,000 h.p., as compared with 2,600 h.p. by the same size of cable at 6,600 volts. Composite pilot and telephone cables have also been installed and on a site near the Valley Road power station, two Hackbridge transformers, each of 2,500 kVA capacity, are installed in the open air to step-up the pressure. The size and number of transformers will be increased as required; they weigh 25 tons each and special lifting tackle has been provided. The 3-phase 50-cycle oil-cooled transformers have both primary and secondary windings star connected with closed mesh tertiary windings. Secondary adjusting tappings give ± 2½ and 5 per cent., while the primary winding is arranged for series-parallel operation at either 49,500 or 24,750 volts.

In 1920 the erection of a new building on the site of the original generating station in Bolton Road was approved: The first section has been completed, and now accommodates in the basement converting plant of a capacity of 4,500 kW, while the upper floors are being utilised as the offices, workshops, and stores of the consumers' department and the electrical testing laboratory. The remainder of the original works will shortly be demolished in order that the second section of the new building may be proceeded with to provide space for additional converting plant.

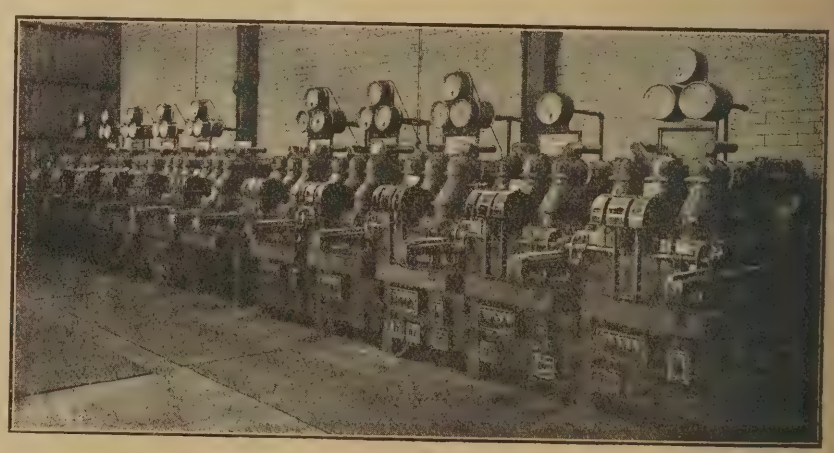

Fig. 8.—Bolton Road Sub-station Switchgear; Hand Operated.

A building in Sunbridge Road, formerly occupied by a small generating set taking steam from a refuse des-

tructor, was reconstructed about 12 months ago and 4,520 kW of converting plant installed therein, while to supplement the existing arrangements for tramway supply, a new sub-station at Four Lane Ends will accommodate two 500-kW completely automatic converters, one of which is now ready to go into service; 500-kW automatic sets are also being installed at the Thornbury and Odsal sub-stations, it being the intention that the

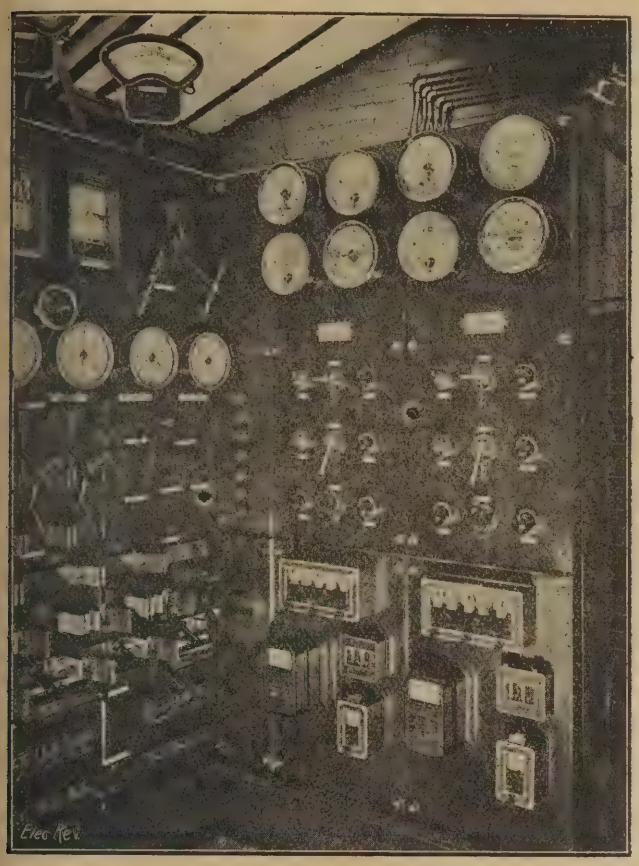

Fig. 9.—Sunbridge Road Sub-station; Remote Control Panel.

whole of the traction converting plant outside the Valley Road works shall eventually be operated without continuous attendance.

The policy of installing one make of switchgear has been extended throughout the rest of the network. At the Bolton Road sub-station a Reyrolle metal-clad switchboard of eleven panels of the single-busbar type, with a rupturing capacity of a quarter of a million kVA, controls both the sub-station equipment and also an important section of the network. As will be seen from fig. 8, this gear is of the direct hand-operated pattern and the small amount of space it occupies makes room available for converting plant in a position in the city where sites are valuable.

The reconstruction of the Sunbridge Road sub-station made it necessary to install remotely-controlled electrically-operated switchgear in the basement immediately below the machines, where any fault on the switchgear or connections would allow flame to spread and probably destroy the machines and building, owing to the strong draught through them for ventilating purposes; Reyrolle metal-clad switchgear was the natural solution of the problem.

The nine-panel board has a rupturing capacity of a quarter of a million kVA and fig. 9 shows the way in which the remote-control panels were placed at either end of the main direct-current board, a procedure rendered necessary by the small space available, being at the same time an extremely handy arrangement as regards operation.

Considerable re-organisation of the transmission and distribution systems has taken place at Bradford during the past year, and in this case also metal-clad switchgear has been installed throughout, and we understand this is now a definite policy of the Bradford Corporation. Fig. 10 shows typical static sub-station switches, indicating also a method of isolating individual legs of looped-in feeders by the use of metal-clad oil-immersed isolators.

The new traction sub-station at Four Lane Ends has been built at a point where three tramway services con-

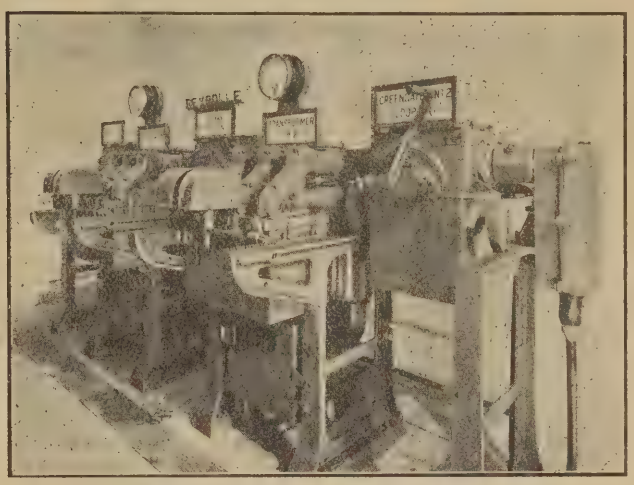

Fig. 10.—Harrogate Road Static Sub-station Switchgear.

verge towards the city, a position where the growing demand urgently required additional support. Fig. 11 is a general view of the first set installed in this sub-station, a Peebles-Reyrolle 500-kW completely automatic equipment, such as has already been installed in the Gorton sub-station of the Manchester Corporation, in various sub-stations of the Brighton Corporation, and elsewhere. The motor-converter is a standard Bruce-Peebles machine receiving three-phase energy at 6,600 volts, 50 cycles, and delivering direct current to the track at 525 volts. In addition to a considerable overload capacity specified on account of its traction duties, this machine can be run as a lighting set when neces-

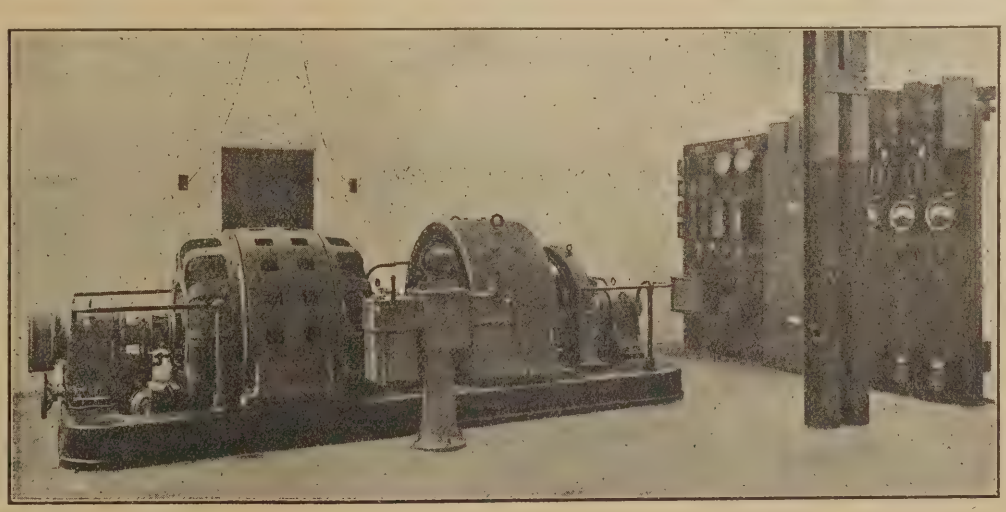

Fig 11.—Four Lane Ends Automatic Sub-station.

sary, thus making it interchangeable with a number of similar sets on the system. The automatic control gear, in common with the e.h.p. switchgear in the building, is of Messrs. Reyrolle's manufacture. Fig. 11 shows the complete automatic equipment with the choke coil and rotor short-circuiting contactors on a pedestal in the foreground. Each contactor is complete with handles

for manual operation, when necessary, the pedestal being surmounted by a synchronising voltmeter. The starting resistance and choke coils are in the basement below, the connections passing down the tubular standard.

The relay board is noteworthy on account of its simplicity, the robust electromagnetic relay used throughout, and also the neat arrangement of the connections behind the board, where the cubicle form of construction has been adopted to afford access to every individual conductor, as well as to accommodate in a dust-tight chamber the resistance and auxiliary devices.

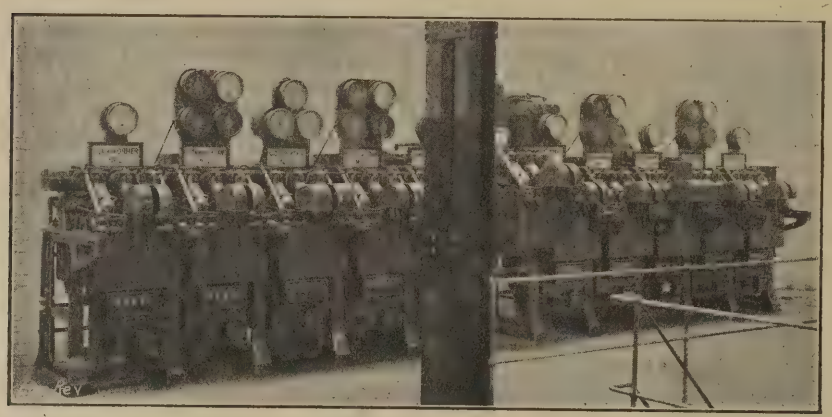

Fig. 12.—Automatic Sub-station H.P. Switchgear.

The direct-current output is communicated to the busbars through the medium of a Reyrolle reactance type circuit breaker, which combines the functions of a high-speed breaker and a low-speed closing device in one unit, and is in itself a complete machine control panel. The principle of electrical reactance has been combined with the series blow-out coils and the main circuit-opening device in an ingenious way. The apparatus is totally enclosed in a sheet-steel cubicle, to be seen in the centre of the switchboard and partly hidden by the upright girder in fig. 11; an armature is held in a given position by shunt coils throughout the whole of the time the main contacts are engaged, and is moved to the open position when the magnetisation of the series coils overcomes that of the shunt coils, the movement of the armature being further accelerated by the drop in voltage incidental upon short-circuit conditions and by a heavy throw-off spring.

The reactance incorporated in this circuit breaker limits the immediate current rush to a value of approximately half the minimum it is possible to obtain with an ordinary high-speed breaker without such characteristics. This has the effect of reducing the commutator energy at the time of the short circuit and has, in itself, provided a margin for heavier contacts capable of withstanding larger continuous loads without heating than those usually associated with high-speed circuit breakers. It is claimed that this apparatus renders rotary plant immune from flashover. Fig. 12 shows the e.h.p. switchgear for controlling the plant in this sub-station, together with an important section of the distributing network.

We are indebted to Messrs. A. Reyrolle & Co. for the photographs and details of the switchgear.

The undertaking has 15,109 consumers with a maximum demand of 31,590 kW, the plant capacity (m.o.r.) being 64,000 kW. The energy sold amounts to 69,347,691 kWh per year and the revenue to £483,385, while extensions since 1907 have involved a capital expenditure of over £1,815,000.

The Shipping and Engineering Exhibition.

A Review of the Principal Exhibits of Electrical Interest.

The Shipping, Engineering and Machinery Exhibition has weathered vicissitudes. With the lifting of the industrial cloud, hope inspires confidence, and this year's show (at Olympia, November 23rd to December 5th), which was opened by the First Lord of the Admiralty, proves that, though trade may sleep for a while, the spirit of enterprise does not; indeed, it cannot afford to do so. A slack period, by freeing the mind from the monopoly of the needs of the hour, affords it an opportunity to plan for to-morrow; it is well to be ahead of the demand.

The official recognition which has been enjoyed by this exhibition in the past has been extended, for in addition to the co-operation of the Society of Motor Manufacturers and Traders, Ltd., and of the Ship and Boat Builders' Association, the section devoted to internal-combustion engines, motor boats, yachts, &c., has been staged under the ægis of the British Marine Oil Engine Manufacturers' Association, whilst the main exhibition has, for the first time, the official support of the British Engineers' Association (Inc.). The chief officers, with one exception, remain unchanged under the presidency of Sir Charles A. Parsons, K.C.B., F.R.S., and the committee of experts is again serving under the chairmanship of Dr. H. S. Hele-Shaw. Ten lectures and papers are being delivered, and some 40 institutions and societies have arranged for official visits to the show, amongst them being the Institution of Electrical Engineers, the British Electrical Development Association (Inc.), and the Institution of Welding Engineers, whilst the entertainment of the Council and officers of the Women's Engineering Society to luncheon by the exhibition authorities was a graceful tribute to the part women are now playing in the engineering industry.

One of the most interesting features, perhaps, is the steady development of aids to navigation, and in this category radio apparatus plays no small part.

Radio Apparatus.

On the stand of the Radio Communication Co., Ltd., a model "wireless room" contains a 1.5-kW spark and

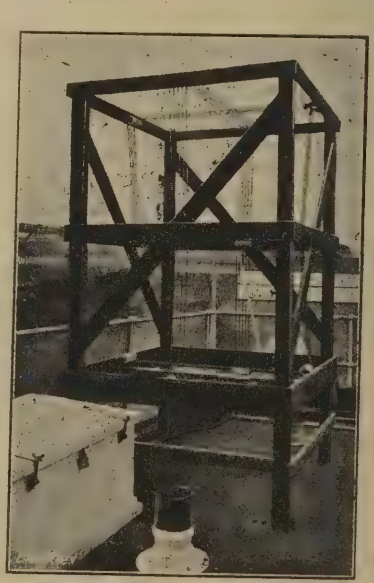

Fig. 1.—Marconi Fixed-frame Direction Finder.

c.w. transmitter and receiving apparatus, whilst other items include a ½- and ¼-kW spark installations, an

automatic calling device, a lifeboat set, and improved direction-finding equipment, some features of which were described last week; the Company's broadcasting department is also represented by a range of "Polar" receivers and accessories.

The Marconi International Marine Communication Co., Ltd., shows eight pieces of apparatus for a variety of purposes. In a model cabin is fitted a complete 1½-kW ship's installation, including both quenched-spark and valve transmitters, emergency apparatus, direction finder, and a marine receiver. The Marconi marine direction finder makes use of two small fixed-frame aerials of special construction fig. 1, instead of the large loop aerial

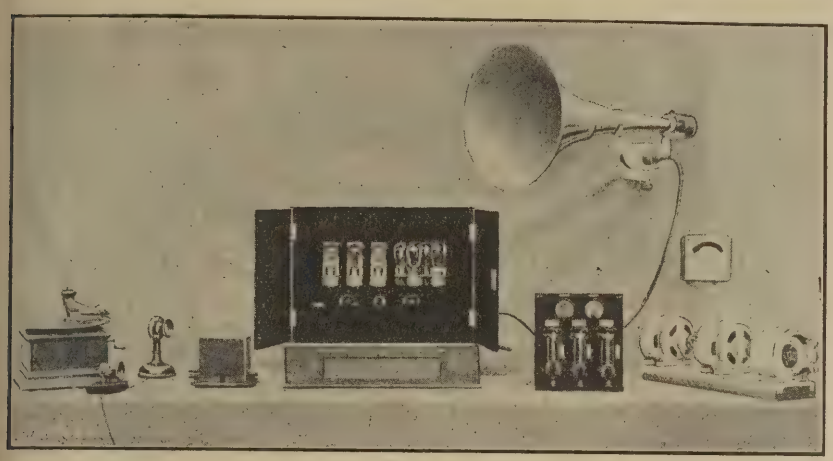

Fig. 2.—A Ship's Orchestra Repeater.

hitherto necessary. The new arrangement does away with all the difficulties encountered in supporting the aerial system with sufficient rigidity. The frame is an open teak structure, approximately 8 ft. high and 4½ ft. square. The new type effects economy both in space occupied and in cost of fitting, while making it possible to place the d.f. instrument in any part of the vessel. A ¼-kW set is exhibited in a smaller model cabin, comprising a quenched-spark transmitter and valve receiver; the transmitter can be operated either direct from the ship's mains, or from an independent storage battery.

As interference from spark telegraphy renders the reception of broadcast concerts at sea difficult, the marine receiver No. 1 (V4) has been designed for yacht owners and passenger ships. It embodies protective circuits and is adjustable for any wave-length from 300 to 3,000 metres, and will normally receive any B.B.C. station under sea-going conditions at 250 miles, and the more powerful stations at Daventry and Paris (Radiola) at 750 miles.

The band repeater for ships, fig. 2, is not strictly wireless apparatus; it comprises a broadcasting microphone, amplifier, and loud speakers to enable music played by an orchestra, or gramophone, to be reproduced in various parts of the ship. The apparatus can be installed with plug-and-socket connections on the decks and in the saloons, lounges, &c., and a generator supplies the power for the filaments and anode circuits, thus obviating the use of batteries which have to be maintained. The Marconi 4-second alarm, fig. 3, is also on view; the calling device transmits flashes of four-seconds duration, which operate the alarms on similarly equipped ships. The apparatus on the right is the 3-valve receiver and relays which cause the bell to ring.

Messrs. Auto Sundries, Ltd., exhibit broadcast receiving equipment and "Radiosun" loud-speakers, together with a range of searchlights suitable for lifeboats and similar sized vessels. Headphones and loud-speakers are also to be seen on the stand of Messrs. G. Brown, Ltd., whilst Messrs. Siemens Bros. & Co., Ltd., are showing, amongst many other items, a cabinet type ship's ¼-kW telegraph outfit that is operated from a small motor-generator, which is fed from a 50-volt battery of accumulators. The current obtained from the alternator is led through a transformer to the excitation circuit, which consists of inductances, condenser, and quenched-spark gap. An aerial variometer is provided for tuning the aerial circuit, and the receiver is a single-valve and crystal instrument with separate tuner covering all standard commercial wave-lengths of both spark and continuous-wave transmission; a regenerative reflex circuit is employed. An installation for motor lifeboats is also shown which can be operated off a small petrol-driven alternator, or by means of a motor-generator driven by current from a battery. The voltage of the alternator is transformed to 4,000 volts by a closed-core transformer, and fed to the excitation circuit, which consists of a Dubilier mica condenser, a 4-part quenched-gap, and an excitation inductance of copper strip. The receiver has one high-frequency valve, one rectifying valve, and one low-frequency valve. By means of switches the third valve may be cut out when not required, while in emergency a crystal detector may be brought into use.

A feature is a single rotating frame direction finder, which consists of a frame aerial enclosed in a tubular ring, 3 ft. in diameter, mounted on a cast-brass column, which in turn is bolted directly to the deck of the vessel. The whole of the column and ring revolves on ball bearings, and the receiver consists of a multi-valve set completely enclosed and electrically screened. This direction finder is claimed to be the only type so far produced having a watertight aerial of comparatively small dimensions that will take accurate bearings on continuous or interrupted c.w. signals, as well as on spark signals.

Electrical Switchgear.

The range of electrical switchgear exhibited by the Igranic Electric Co., Ltd., is very extensive, and includes the latest type of star-delta switch, fig. 4, fitted with a patent thermostatic overload relay movement. The switch is of the drum type; revolving arc barriers are provided between each of the fingers and construction on the unit principle provides free accessibility and easy replacement of worn parts. An interesting item is an automatic multiple-contactor self-acting starter, fig. 5, used for motors driving air compressors and hydraulic and centrifugal pumps on a direct-current supply; these panels operate at from 110 to 550 volts. Fig. 6 shows an automatic starting rheostat and speed-regulating panel which is used in connection with machine tools, printing presses, &c. Such controllers enable a considerable saving of time to be made in preparing the machine and setting up the work. Hand-operated and automatic starting panels for both a.c. and d.c. motors are exhibited, together with battery-charging panels, theatre dimmers, &c. A model lifting

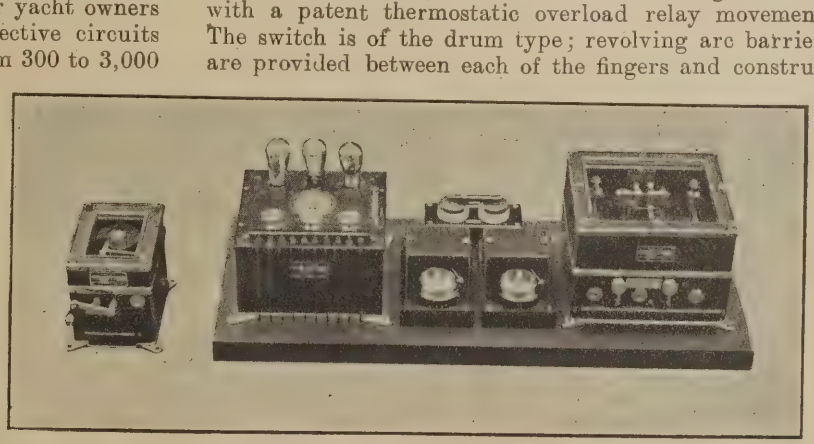

Fig. 3.—A 4-second Radio Alarm Device.

magnet is shown in addition to a range of the well-known Igranic radio devices.

"Vauxhall" switchgear is displayed by the Electrical Apparatus Co., Ltd.; also motor control gear and electricity meters. The smaller panels suitable for wall or bulkhead fixing include a miniature size for ventilating fans, &c. The heavy roller contact starters embody magnetically-operated contactors for heavy

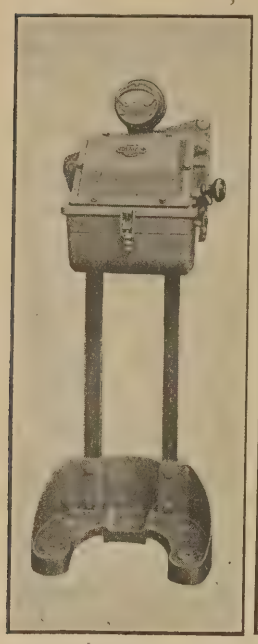

Fig. 4.—Igranic Star-Delta Switch with Thermostatic Overload Relay.

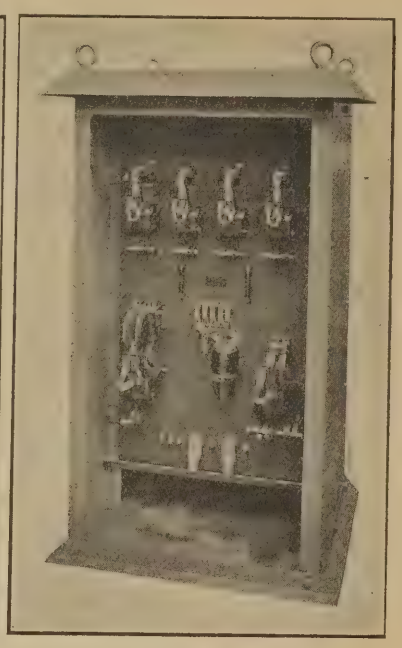

Fig. 5.—Multiple Contactor Self-acting Starter.

duty; a large size is on view in which the roller contacts have been replaced by manually-operated contactors, one for each step.

Swiss Rural Distribution Gear.

Mr. J. B. Rudkin (representing the Sprecher & Schuh Co., Switzerland) is showing gear that is of special interest in connection with the development of rural distribution of electrical energy. A 3-pole, 45,000-volt outdoor type overhead transmission line sectioning switch combined with h.p. expulsion type fuses contains no cement of any kind for the purpose of fixing the metal parts to the insulators, all such fixing being done mechanically; cement is a source of danger, since through its expansion on account of atmospherical variations, insulators may burst. The line-sectioning switch exhibited is built for mounting on the flat top of an iron transmission tower; the fuses are accessible from a platform and the switch is operated by means of a lever contained in a cast-iron case fitted with a lock and key. Unless the operating lever be moved completely to its "on" or "off" position, the cover of the case cannot be closed and locked. This simple interlock guarantees, therefore, completion of the switching operation, excludes the possibility of leaving the switch in a half open or half-closed position, and also excludes the possibility of the self-closing of the switch in a gale. Identical switches to the one exhibited are giving full satisfaction on a transmission line of the Clyde Valley Electric Power Co.

A 3-pole, 12,000-volt automatic overload outdoor type line-sectioning switch shown is fitted with a direct acting overload time-limit release and a loose handle attachment, the former being protected against the weather by metal hoods, and the

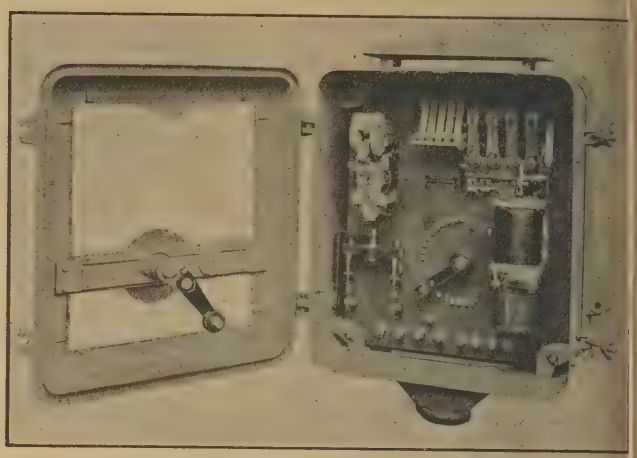

Fig. 6.—Automatic Starting Panel.

switch will, it is claimed, operate under all climatic conditions; an exclusive feature is the isolation of the tripping gear by standard post-type porcelain insulators. The mast transformer station represents a cheap self-contained outfit for supplying electrical energy to small isolated consumers, such as groups of houses, isolated farms, &c.; besides the choke coils, primary and secondary fuses, surge protecting gear can be fitted if required. Operation of the 3-pole, 12,000-volt, oil-immersed circuit breaker shown is effected by a handwheel, all active switch parts being fixed to the cast-iron cover, which in this way forms practically the base plate for the entire mechanism. The overload time-limit releases are mounted direct on top of the switch terminals. The switch is characterised by very strong construction, long break, high switching velocity, and consequently high breaking capacity.

Knife switches for switchboard mounting, nickelled to avoid tarnishing, are made in sizes up to 1,000 amp., and in others for back-of-panel mounting with the operating lever only on the front of the panel, no porcelain is used as insulating material. The contacts are fixed mechanically to iron bars which are surmounted by insulating material, and these switches are specially used for factory or mining gear so as to guard the live metal from accidental touch, being built in sizes up to 4,000 amperes.

(To be continued.)

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

Hackney Propaganda.—During the ensuing winter season the Hackney Electricity Department is arranging a series of interesting lectures on electricity and closely-allied matters for the public. In the list which we have received we notice a number of well-known names. Mr. Ll. B. Atkinson is to speak on "The Romance of Copper"; Mr. A. F. Berry has tentatively chosen for his subject "Electrical Heating and its Relation to Health"; and Mr. T. H. Windibank is down for a lecture on "Some Problems in Electric Driving." Most of the lectures are to be illustrated by films which should add to the attraction. On December 10th, at the Demonstration Halls, a film entitled "Coal Heap to Consumer" is being exhibited; Alderman Mrs. Hammer is to lecture on "A Woman's Best Friend," and there will be an exhibition of electrical appliances which will also be demonstrated.

Glasgow and the Scottish J.I.C.—A committee of the Glasgow Corporation advises the Corporation not to contribute to the working expenses of the Scottish District Joint Industrial Council for the Electricity Supply Industry.

A West Ham Poster.—Mr. F. W. Purse, engineer and manager of the West Ham Electricity Department, has sent us a specimen of the first of four posters which his department is issuing. This is headed "Return to Gold Standard," and states that the one-pound note (illustrated) is now worth its face value in gold, while the electric lamp (also illustrated) is worth its weight in gold.

G.E.C. Underground Equipment.—The General Electric Co., Ltd., has recently received two repeat orders from the London Electric Railway, for complete electric traction equipments for new rolling stock. These will be precisely similar to those already supplied by the company for the new Morden extension. The orders comprise complete equipments for 48 motor coaches, 67 control trailer coaches, and five ordinary trailer coaches, bringing the total of traction equipments of this type ordered by the London Electric Railway from the company to 95 motor coach, 78 control trailer, and 55 ordinary trailer coach equipments.

The F.B.I. and Foreign Loans.—The Federation of British Industries has written to the Chancellor of the Exchequer expressing its appreciation of the removal of the embargo upon foreign loans. At the same time it is pointed out that the instability of currency in a number of countries has serious reactions upon British trade, and it is therefore urged that the Government should prohibit the floating of loans in Great Britain by these countries unless they are intended to secure the stabilisation of currency.

A "Chloride" Conference.—It is the practice of the Chloride Electrical Storage Co., Ltd., to convene periodical conferences of its sales representatives, a practice which is to be recommended in view of the useful interchange of experi-

A "Chloride" Conference.

ence which takes place. We reproduce herewith a photograph of the executive and sales staff of the company taken at a recent conference at Clifton Junction. In the centre of the group are Mr. W. S. Naylor, the managing director, and Mr. D. P. Dunne, director and sales manager.

"The Truth."—A performance of "Nothing but the Truth," which was to have been given on Friday last by Henley's Dramatic Club, was postponed owing to the death of Queen Alexandra. It will take place at King George's Hall, Caroline Street, Great Russell Street, W.C.1 (near Tottenham Court Road station), on Saturday, December 12th.

"Magnet" Christmas Gifts.—The General Electric Co., Ltd., is issuing a booklet and a brochure dealing with its plans to encourage the sale of its appliances as Christmas gifts. The booklet contains illustrated details of the domestic and radio devices that are available, while the brochure includes pictures of shop-window displays which the company is willing to supply to dealers.

A Large Electric Sign.—Messrs. Lewis, the prominent drapers, &c., have erected a very large electric sign upon the front of their Liverpool premises above their show windows.

Electrical Trades Commercial Travellers' Association.—The annual meeting of the Association was held on November 13th, when the officers were unanimously re-elected *en bloc* and fifteen new vice-presidents were appointed A letter from the Railway Clearing House was read promising substantial reductions in commercial travellers' week-end fares. A satisfactory balance sheet was presented.

British Malayan Electrical Imports.—The bulk of electrical goods and machinery imported into British Malaya continues to be of United Kingdom manufacture. The following comparative table setting out the value of imports during the whole year 1924 and the value of imports during the first eight months of the current year shows an increasing demand. Electrical development in the country is progressing and an even greater demand may be anticipated in the near future.

Country of origin.	Electrical goods and apparatus.		Electrical machinery.	
	1924.	1925. Jan.-Aug.	1924.	1925. Jan.-Aug.
	£	£	£	£
United Kingdom ...	222,545	210,819	73,583	80,456
British Possessions ...	2,470	2,903	732	908
Continent of Europe	17,672	17,401	10,983	12,934

Total ...	£263,286	£257,112	£116,222	£101,203

Social Events.—The Welfare Club of the Southport Corporation Electricity Department held their annual dinner on Tuesday, November 24th. In addition to the chairman and vice-chairman of the Committee, Mr. F. Crawford, manager of the Liverpool Branch of the General Electric Co., Ltd., and the G.E.C. Troupe of Entertainers were present. During the evening Councillor Little, a past-chairman of the Electricity Committee, presented a shield to the winner of the Departmental Bowling Handicap.

The E.T.U. London Station Engineers, No. 1 Branch, held their ninth annual concert on Tuesday evening at "The Brighton," Queen's Road, Peckham.

A B. I. & H. Housing Scheme.—In a recent letter to *The Times*, Mr. D. Sinclair, managing director of the British Insulated & Helsby Cables, Ltd., gave details of a scheme by which a number of the company's employés, with the company's assistance, have secured houses at a reasonable cost. Twenty-four employés formed a co-operative building society for the purpose of building a house for each member. This society undertook to do the whole of the work itself, and the members were accordingly chosen for their ability to contribute to the building, *i.e.*, they were bricklayers, joiners, plumbers, &c. The company undertook to purchase the materials required and also advanced the necessary funds at 5½ per cent. interest, the principal being repayable at any time by any method convenient to the employés; a mortgage on each house is held by the company to secure the loan. Each owner is free to sell his house if he wishes to do so. So far, Mr. Sinclair says, 18 of the 24 houses have been finished, and the only

A Large Christmas Sign.

This sign is illustrated herewith. It is 240 ft. in length and 30 ft. high, and employs about 10,000 "Osram" lamps of various sizes, and seven miles of wire. The work was carried out by the firm's own electricians.

Esthonian Tramway Extensions.—The *Board of Trade Journal* reports that electric tramways are superseding the internal-combustion engined cars in Reval. The cars have been built in Esthonia and the rails for the permanent way were purchased in the United Kingdom. The total amount so far expended is 60 million Esthonian marks; further extensions of the tramways will be commenced shortly.

Lead.—Messrs. James Forster & Co. state that during the week ended November 28th consumers had shown little interest in the market, and few fresh purchases had been made. The only strength continued to be derived from America, but even in that country there were indications that conditions were not quite so firm as formerly, though the price remained unchanged.

criticism which can be passed is that the builders have, if anything, been extravagant of both labour and materials, realising that they were building for themselves. Opposition was encountered from trade unions, but as they were unable to prevent men from working for themselves without pay they were unable to stop the scheme. Mr. Sinclair considers that the scheme could be adopted in many instances where public authorities and other organisations employ suitable and capable men. The method results in soundly-constructed houses costing far less than those erected in the ordinary way.

German Porcelain Price Reduction.—It is reported that the German Porcelain Manufacturers' Association has decided to reduce its prices by 10 per cent.

Siemens-Schuckert in Palestine.—The *Financial News* reports that the Siemens-Schuckertwerke is participating in a textile enterprise which is being established in Palestine, and will construct the plant. The enterprise embraces agriculture also.

Trade Announcements.—The Chloride Electrical Storage Co., Ltd., is shortly removing its London repair depôt to much larger premises at Lexden Road, Acton, which have previously been used as a garage by the London General Omnibus Co.

Mr. J. A. Collins, who has been appointed London representative for the Stella Conduit Co., Ltd., is carrying large stocks, at 39, Victoria Street, S.W.1.

The London office of Messrs. Richardsons, Westgarth and Co., Ltd., has been removed to 121-124, Abbey House, 2, Victoria Street, London, S.W.1.

Mr. Walter A. Ward, electrical contractor, Merton Abbey, S.W.19, notifies us that his telephone number is "Wimbledon 3270."

Messrs. Leonard Toomer & Co., 54, Lower Thames Street, London, E.C.3, ask for latest trade priced catalogues and terms of electrical and radio goods.

Catalogues and Lists.—The General Electric Co., Ltd., Magnet House, Kingsway, W.C.2.—A catalogue of "Osram" lamps. Fully illustrated and priced. Priced and descriptive leaflet dealing with ships' lifeboat-launching flood lights.

Messrs. Ward & Goldstone, Ltd., Frederick Road, Pendleton, Manchester.—An illustrated and priced pamphlet dealing with the "Goltone" "high-tension battery eliminator," to be used in conjunction with radio sets from d.c. lighting mains.

The Cressall Manufacturing Co., Ltd., 40-41, Staniforth Street, Birmingham.—An illustrated and priced leaflet advertising the "Cressall" unit heater.

The Marconiphone Co., Ltd., 210-212, Tottenham Court Road, W.1.—Publication No. 437, describing the "Marconiphone Type 21" receiving set and the "Sterling Dinkie" loudspeaker. Illustrated and priced.

Messrs. Oerlikon, Ltd., Oswaldestre House, 34-35, Norfolk Street, Strand, W.C.2.—Oerlikon Bulletin No. 49, dealing with railway electrification in Switzerland, and a new explosion-proof motor; No. 50, describing ladle cranes and their electrical equipment; and No. 51, dealing with a Brazilian electric railway.

Nobel Industries, Ltd., Nobel House, Buckingham Gate, London, S.W.1.—New edition of a pamphlet giving an outline of their associated companies and their products, including those connected with electric shot-firing, electric welding, motor accessories (lighting and starting equipments), &c.

Messrs. Ferranti, Ltd., Hollinwood, Lancs.—Effective show card of their A.F.3 intervalve transformer.

The English Electric Co., Ltd., Queen's House, Kingsway, London, W.C.2.—Publication No. 571a, fully illustrating and briefly drawing attention to the company's two-cylinder steam turbine, 20,000 kW, 3,000 r.p.m.

Messrs. Donovan & Co., 47, Cornwall Street, Birmingham.—Twenty-page price list of electric lamps, cables, switches, accessories, &c. Sixteen-page illustrated price list of "Supastone" glassware.

Bankruptcy Proceedings.—S. C. Rapson, C. L. Burrill, and A. J. Heffer, trading as the Suburban Electrical & Maintenance Co., electricians, 2, Plough Yard, Shoreditch.—The public examination of these debtors was held on November 24th before Mr. Registrar Mellor, at the London Bankruptcy Court, the accounts showing liabilities of £2,855 against assets valued at £718. The debtor Rapson stated that having served his apprenticeship to an electrical engineer, he, in 1911, borrowed £100 and commenced business on his own account. The business was successful, but was closed down in August, 1914, when he was called up as a Territorial. In March, 1922, he and the debtor Burrill commenced business in partnership at Poplar, as electrical contractors, under the above style. Witness borrowed from relatives £300 for capital; the trading was successful and in June, 1922, they were joined in partnership by Heffer, who brought in as capital £100 which he had borrowed. In March, 1923, they opened an electrical shop and stores at Shoreditch, which business they carried on under management. In November, 1924, they contracted to re-wire the west and new wings of Somerset House at the price of £2,450, but towards the completion of the contract they discovered that they had considerably underestimated the cost of labour, &c., and the contract was finally completed for £3,400, the firm's net loss being £611. As a result of that loss they were unable to meet their obligations and pressure was exercised by creditors; a private meeting was held on May 13th, 1925, when an offer of a composition of 7s. in the £ was opposed by one creditor and these bankruptcy proceedings followed on their (debtors') own petition. Witness attributed the firm's failure to lack of working capital, loss in relation to the Somerset House contract, and, in a minor degree, to bad debts. No account was kept of the drawings, but each partner took out £5 a week. Having regard to the fact that the business was started with borrowed capital, the firm had been insolvent throughout. The debtors Burrill and Heffer confirmed the evidence given by their partner and the examination was concluded.

W. G. Conway (trading as "Listron"), radio component dealer, 88-90, Chancery Lane, W.C.—The first meeting of creditors was held on November 26th, at the London Bankruptcy Court. The Official Receiver reported that it appeared that the debtor began business in November, 1924, with a small capital, and traded with success until March last, but business then declined owing to a slump. In that month he verbally agreed to supply a certain firm with 105 gross of "Listron" crystals. He actually delivered 47½ gross, and on the strength of that order he obtained boxes sufficient to enable him to complete the contract, but the customer refused to take delivery of the whole order, and that meant a loss to the debtor of £700 (inclusive of heavy advertising expenses and brought about his present position. On June 9th Listrons Ltd., was formed with a nominal capital of £500, to acquire his business, but no sale agreement had been drawn up the debtor had received no consideration, and, in fact, the company had never functioned. A private meeting of the creditors was held on June 30th, when an offer of a composition of 5s. in the £ was rejected; the landlord distrained in August, and these bankruptcy proceedings followed, a receiving order being made on November 9th on a creditor's petition. The liabilities and assets were roughly estimated at £600 and £315, respectively. A resolution was passed for Mr. Chas. Lathom, accountant, 78, New Oxford Street, W.C., to act as trustee in bankruptcy.

W. J. Lattimer, trading as W. J. Lattimer & Co., 52, High Street, Croydon, electrical engineer.—The public examination of this debtor was held recently at the County Court, Croydon. The statement of affairs showed a deficiency of £274, the assets amounting to £10. Debtor attributed his failure to lack of capital and underestimating the cost of contracts. He started business without capital in 1919, opening a shop in Lower Addiscombe Road. This was successful until he closed it down and carried on in a store at the back. The examination was adjourned.

G. F. Wood, electrical engineer, 28, Highgate Road, N.—Receiving order made November 19th, on creditor's petition. First meeting December 3rd, public examination January 19th, both at Carey Street, W.C.

D. A. Griffiths and R. L. Hughes (Griffiths & Hughes), electrical engineers, 13b, Whitcombe Street, Aberdare.—First meeting December 4th, at 34, Park Place, Cardiff, public examination January 22nd, at the Temperance Hall, Aberdare.

C. J. Tomlin, electrical engineer, 12 & 13, Henrietta Street, Covent Garden, W.C.—Trustee, Mr. D. Williams, Official Receiver, Carey Street, W.C., released November 17th.

J. Cowan (National Electric Co.), electrical engineer, 2, Gothic Arcade, Snow Hill, Birmingham.—Trustee, Mr. T. Easton, Official Receiver, 191, Corporation Street, Birmingham, released November 19th.

F. A. Fraser, Sanctuary House, 33, Tothill Street, S.W.—Application for discharge to be heard December 16th at Carey Street, W.C.

M. H. Murad (Murad & Co.), wireless manufacturer, 126, Princess Street, Manchester.—Bankrupt discharged November 2nd, 1925.

W. E. Melrose, electrical engineer, Chewton Road, Keynsham, Bristol.—Trustee, Mr. F. W. Darley, Official Receiver, 26, Baldwin Street, Bristol, released November 20th.

Dissolution of Partnership.—Bourne & Co., electrical and general engineers and contractors, 281, Wimbledon Park Road, Southfields, S.W.19.—Mr. H. F. Bourne and Mr. F. J. Tomblin have dissolved partnership.

New Derby Electricity Hall.—The Derby Corporation has established an electricity hall at 9, Irongate. Former warehouse property has been acquired and converted into a most attractive centre containing a manifold variety of lighting, heating, cooking, and power apparatus. At the back of the buildings workshops have been arranged. The formal opening ceremony was performed on November 25th by the chairman of the Electricity Committee, Alderman W. G. Wilkins, J.P. The hall was designed with excellent effect by Mr. G. M. Eaton, the scheme of colouring, in which cream and gold tints predominate, adding greatly to its artistic appearance. Model dining rooms, showing electric heating and a variety of other appliances, a lounge demonstrating various methods of indirect lighting, with illuminated flower bowls, &c., and a bedroom with electric heaters, bed warmer, bed reading lamp, &c., are among the conspicuous features of the display. From the balcony access is obtained to a demonstration lounge and model kitchen, the former having seating accommodation for 50 persons.

Local Exhibitions.—Sheffield.—The Master Cutler, Mr. T. R. Ellin, last week opened an "all-wireless" exhibition, promoted by Provincial Exhibitions, Ltd., and supported by local newspapers. The Edmund Road Drill Hall, which has the largest floor space of any building in the city, is admirably set out with stalls representing manufacturing and trading firms; the Sheffield and District Wireless Society has a stand filled with sets made by members. There are a number of competitions for amateur builders, and from a business point of view the undertaking seems likely to prove a decided success. It remains open until to-morrow (Saturday).

Blackburn.—At a Trades Exhibition held in the Public Hall last week there was a very effective display of domestic electrical appliances by the Blackburn Electricity Department.

New French Company.—A new company has lately been formed in Paris (4, Rue Cambronne) with a capital of 1,700,000 fr. and the title La Société d'Exploitation de la Téléphonie Picart et Lebas, to acquire and develop the Picart and Lebas telephone business at La Boissière (Eure et Loire).

New Belgian Companies.—Among the new concerns recently formed in Brussels are the Société de l'Electricité Industrielle Belge, with a capital of one million francs, and the Société Industrielle et Commerciale Electro-Mécanique, with a capital of three million francs.

Co-partnership in Industry. — In a letter appearing in *The Times* on November 28th, Mr. E. Garcke gives some information regarding a proposal that is to be submitted to the employés and representatives of the Brush Electrical Engineering Co., Ltd., of which he is chairman, inviting them to collaborate in forming a scheme of co-partnership between Labour, Management and Capital. Foreign competition necessitates, he says, increased output and reduced prices, but it is believed to be possible to effect economies without reduction of wages and probably also to increase profits to a small extent. Greater efficiency and economies are always possible. The utmost benefit of co-partnership cannot be secured by its adoption in any individual establishment alone, for "in specialised manufacture perhaps the main items in the costs of production are the materials purchased from other manufacturers, and if their costs, and, therefore, their prices, are high, our costs and prices are necessarily still higher, however efficient our organisation may be. Wages are in a different category, because the efficiency of labour admits of improvement by proper regard for the human element."

The Brush directors, says Mr. Garcke, will submit for consideration and discussion the main features of their proposal, and will leave the details to be settled after consultation with the various parties concerned. The main principles on which they base their action are:—

(*a*) That the two opposite postulates which are now the crucial points in dispute between Labour and Capital—namely, (1) that Labour is the sole producer of wealth, and (2) that Capital is entitled to the whole of the profit—are both fallacious; and that it is wiser to recognise that profit belongs to all who have contributed to produce it, in due proportion to their rights and deserts.

(*b*) That instead of drifting by strife towards the slow realisation of the late Lord Milner's anticipation "of Labour hiring Capital instead of Capital hiring Labour," it is better to facilitate workers becoming capitalists.

For Sale.—Bristol Corporation Electricity Department invites offers for disused plant, including boilers, economisers, coal conveyor, piping, tanks, &c. Beckenham Cottage Hospital authorities invite offers for a large and complete X-ray apparatus. Hackney Borough Council Electricity Department has for disposal surplus generating plant, including one 3,000-kW turbo-alternator with condensing plant, &c.; four 150-kW Holmes dynamos; two motor-driven fans; and three 6-h.p. motors; Ipswich Board of Guardians invite offers for surplus generating plant due to changing over to town supply; Nottingham Corporation Electricity Department has for disposal boilers, economisers, pumps, feed water heaters, &c. (See our advertisement pages to-day.)

Our Problems.—At the meeting of the Liverpool Engineering Society held on Wednesday evening Sir Peter Rylands, ex-president of the F.B.I., read a paper on "The Problems of British Industry."

Chinese Notes.—The Ministry of Communications has licensed a new electric light company which has been formed at Shunteh (Chihli province).

The Hanyang Electricity Co., Ltd., formed with a capital of $120,000 at Sanmatow, Hokai, has commenced operations with a 65-h.p. plant of Chinese manufacture.

The Ministry of Communications is installing a radio-telephone service between Tientsin and Shanghai.

A telephone company is being formed at Changteh (Hunan province) with a capital of $40,000.

The long-distance telephone services in various parts of Chekiang province have been completed. The head office of the administration is at Hangchow and the services are open to the public.

Japanese Electrical Notes.—The Odawara Rapid Transit Railway Co., Ltd., with a capital of 13,500,000 yen, of which 1,350,000 yen has been paid up, plans running an electric railway for a distance of about 50 miles from Shinjuku, Tokio, to Odawara. The line will be opened to traffic in about March, 1927.

The Hiroshima Electric Co. is shortly erecting its second Eno-gawa water power station in view of the increased demand. The station will have an output of 11,000 kW and will be completed by June, 1927. The company is also building a steam power station as a stand-by with an output of 25,000 kW.

It is understood that the Kuhara Mining Co. has decided to build water-power stations of about 100,000 kW, on the Shokawa in Giju and Toyama Prefectures.

The Shinano Electric Co. plans generating electricity on the Doi River on the upper reaches of the Shinano River by erecting two power stations, each of which will have an output of about 500 kW.

The Sennan Electric Industrial Co. is designing its second power station and will issue an inquiry for tenders within this year, so that the work of construction will be started early next year.

The Kochi Prefectural Office plans to extend its hydro-electric plant at a cost of 1,000,000 yen.

It is stated that the South Manchurian Railway authorities have practically decided to make their electrical business independent of the railways next fiscal year by establishing a company, which will be known as the South Manchurian Electric Company.

Australian Tariff Decision.—Under a recent decision of the Australian Customs Department, resistance wire for use in the manufacture of all kinds of electrical apparatus is to be admitted free under the British preferential and intermediate tariffs; under the general tariff a duty of 10 per cent. *ad valorem* will be imposed.

American Capital in Italy. — According to the *Financial News*, American interests have recently been active in Italian affairs. Messrs. Blair & Co. (Inc.) are stated to be negotiating a loan of $20,000,000 for the Piemont Water-power Syndicate and other hydro-electric interests. The Edison group is said to be negotiating to take over the telephone service of several large cities, including Genoa, Turin, and Rome; and arrangements are also being made for the issue of a dollar loan on behalf of the Turin gasworks.

New Italian Companies. — Among the new concerns recently organised in connection with the electrical engineering industry in Italy are the Società Select Electra Company, Milan, capital 250,000 lire; La Società Industrie Lampade Elettriche Speciali, Novara, capital 50,000 lire; and La Società Italiana Macchine Elettriche R. Dolfin e Cie., Milan.

Book Notices.—"The Conservation of the Nation's Vegetation," by Mr. R. W. Ascroft, M.B.E., F.R.H.S.—Considerable information and many data are given in this booklet concerning the damaging effects of smoke and soot on plant life. The results of tests for ascertaining the total deposit of impurity from the air in tons per sq. mile for the year ended March 31st, 1924, shows the figure for Rochdale as 793.86, compared with 100.92 for Rothamstead.

"*Journal* of the Institution of Production Engineers." Vol. V, No. 1, November, 1925. Price (non-members), 1s.—This is the first issue of the Institution *Journal*, the inception of which is the outcome of a difficult situation brought about by the cessation of publication of the Institution's official organ. An effort is being made to bring deserved success to the publication, which we hope will be achieved. The presidential address by Mr. R. H. Hutchinson (1925-26) is published in this initial number. He appeals to the members to adopt the slogan "Attention to detail."

"The Ego and Physical Force," by I. C. Isbyam. Pp. x+138. London: C. W. Daniel & Co. Price 5s. net.—The author of this book contributed an article to the ELECTRICAL REVIEW entitled "The Principle of Relativity Simply Explained" in 1919, and another entitled "The Principle of Quanta Simply Explained" in 1923; both are here reprinted as appendices in a work which extends these principles to explain phenomena of consciousness generally. Readers interested in such matters will find the book enlightening. The electrical structure of matter is now accepted, but the electrical structure of mind is new. The contents are cast in the form mainly of duologues, together with a monologue and a lecture, and contain abundant material for thought.

"The Mechanical World Year Book, 1926." Pp. 348+177; illustrated. Manchester: Emmott & Co., Ltd. Price 1s. 6d. net.—Engineers will find here many useful data concerning the diverse fields of mechanical engineering, including steam and hydraulic, other than structural work. The usual mensuration and logarithm tables are included, and a diary and memoranda are provided.

"Science Abstracts" (A and B). Vol. XXVIII. Part II. November 25th, 1925. London: E. & F. N. Spon, Ltd. Price 3s. each.

"An Introduction to Industrial Administration," by J. Lee. Pp. vii + 194. London: Sir Isaac Pitman & Sons, Ltd. Price 5s. net.

"Electrical Circuits and Machinery," by J. H. Morecroft and F. W. Hehre. Vol. III, Experiments. Pp. vii+165; figs. 56. London: Chapman & Hall, Ltd. Price 10s. net.

"Scientific Papers of the U.S.A. Bureau of Standards." Vol. 20, No. 509, July, 1925. Alternating Current Distribution in Cylindrical Conductors. Price 15 cents.

"Technologic Papers of the U.S.A. Bureau of Standards." Vol. XIX, No. 296, August, 1925. Price 10 cents.

"Supplementary List of Publications of the U.S.A. Bureau of Standards, beginning July 1st, 1925." Price 10 cents.

"Institution of Electrical Engineers." List of corporate and non-corporate members of the Institution, corrected to September 1st, 1925. London: The Institution.

Trade Facilities Guarantees.—Among the recent guarantees by the Government under the Trade Facilities Acts is one of £1,250,000 for the Perak Electric Power Co., Ltd., in connection with the purchase of British plant and machinery for the development of hydro-electric resources in the Malay States. The total amount of guarantees up to September 30th was £58,827,241.

Electrical Activity in Japan.—It is reported that American manufacturers have recently received further Japanese orders for generating plant, although the Government is endeavouring to foster the home industry.

Tramway Wage Increase.—The Burnley Tramways Engineering Department has increased the basic wage of employés of £2 16s. by 10s. per week, and the holidays have been extended to nine days per year, with pay.

Copper, Lead and Rubber Prices.—Messrs. F. Smith and Co. report December 1st: No change in the prices of copper (electrolytic) bars, sheets, and wire rods; h.c. wire, 9¼d., 1/16d. decrease.

Messrs. James & Shakespeare report December 1st:—Copper bars (best selected) sheet and rod, no change; English pig lead, £36 10s., 15s. decrease.

Messrs. Edward Till & Co. report December 1st:—India Rubber, Para, fine 4s. 3½d., 3½d. increase.

Lighting and Power Notes.

Australia.—THE JACKADGERY HYDRO-ELECTRIC SCHEME.—Referring to the New South Wales Ministry's decision to abandon the Jackadgery hydro-electric scheme, as reported in our last issue, the *Industrial Australian and Mining Standard* gives the following details with regard to the adverse reports:—Mr. Carter, chief electrical engineer of the Public Works Department, in a report, stated that for the initial development the cost would be over £150 per effective kW. Such a high figure might possibly be accepted were the power available continuously, but the whole estimates were based on a 30 per cent. load factor. The capital cost of a steam station of this size was approximately £30 per effective kW. For the ultimate development of 20,000 h.p. the cost would probably be reduced to the neighbourhood of £120 per kW, but even this figure was excessive, under the circumstances. No revenue could be earned from the scheme until practically the whole of £1,530,000 had been expended. The special expert committee on hydro-electric development, consisting of Mr. E. M. de Burgh, chief engineer to the Water and Sewerage Board; Mr. H. H. Dare, Water Conservation and Irrigation Commissioner; and Mr. H. G. Carter, chief electrical engineer, submitted a report on the scheme, stating that in view of the information before them, and of Mr. Carter's report, they could not recommend the Council to embark upon the scheme.

WAGGA (N.S.W.).—After long negotiations between the Municipal Council and the Public Works Department, a draft agreement has been prepared covering conditions for the supply of electricity from the Burrinjuck hydro-electric works to Wagga. Electricity will be available to Wagga by the middle of next year. The estimated saving to the Council will be £5,000 annually by using the Burrinjuck scheme instead of its own power plant, which was installed at a cost of more than £60,000.

Bath.—NEW PLANT.—The Electricity Committee has recommended to the City Council that application be made for sanction to a loan of £92,928 for a new 6,000-kW turbo-alternator and accessories, a 40,000-lb. water-tube boiler, the cost of altering periodicity and voltage transformers, and the extension of mains to further parts of the city and suburbs. It is also proposed to apply for sanction to loans of £8,500 to cover the amount overspent on mains and £15,000 for mains for future extensions.

Brecon.—ELECTRICITY SCHEME.—The Town Council is to apply for an Order to supply electricity within the borough and in the parishes of Castle Inn and Christ College. A site has been chosen for the erection of a generating station.

Burnley.—STREET LIGHTING.—The Corporation is obtaining alternative prices for the lighting of the main thoroughfares by gas and electricity.

Cleethorpes.—ELECTRICITY AGREEMENT.—The Urban District Council has received the draft of an agreement for a bulk supply of electricity to the district from Grimsby Town Council, and has forwarded it to its consulting engineer for consideration and report. The Electricity Commissioners have expressed approval of the proposed agreement.

Continental.—FRANCE.—The General Council of the Lower Pyrenees has recently decided that the rural districts not yet provided with a system of electricity supply shall be supplied by means of lines running parallel with the local tramways. It is estimated that 212 communes in the Department have already been provided for, while work is in hand on 23 other communes.

Dover.—ELECTRICITY IN BULK.—The Corporation has received an offer by Tilmanstone Colliery to supply electricity in bulk. Negotiations are in progress.

Glasgow.—PROGRESS DURING OCTOBER.—During October 154 houses were wired under the Corporation Electricity Department's scheme, bringing the total to date to 1,441, and the applications for hire of appliances numbered 512, making the total 8,415.

Guildford.—NEW POWER STATION.—At a recent meeting of the Electricity Committee, the Town Clerk submitted the formal consent of the Electricity Commissioners to the establishment of a generating station on the site in Woodbridge Road.

Hebden Bridge.—ELECTRICITY SUPPLY.—Owing to the increasing demand for electricity, the Urban District Council has instructed the electrical engineer to obtain details as to procuring an increased bulk supply, or enlarging the local generating plant.

Hoylake and West Kirby.—LOAN.—The Urban District Council is applying for sanction to the borrowing of £5,000 for mains and services.

Ilford.—LOAN SANCTIONED.—The Urban District Council has received sanction to loans of £20,000 for mains and services, and £2,000 for domestic apparatus.

WIRING OF SMALL HOUSES.—The electrical engineer is to prepare a report on a proposal to wire new Council houses at Horns estate for lighting, heating, and cooking.

Irish Free State.—CARRICK-ON-SUIR (Co. TIPPERARY).—A scheme to provide an electricity supply for the town has been postponed by the Urban District Council pending the completion of the Shannon power scheme. The estimated cost of the scheme was £8,000.

HOWTH (Co. DUBLIN).—At a recent meeting of the Urban District Council, the question of an electricity supply for the harbour area was considered. It was decided that if the Board of Works erected the lamp standards, the Council would supply the energy.

ELECTRICITY SUPPLY BILL.—In the Dail the Electricity Supply (Special Powers) Bill recently reached the Report stage. The Bill is designed to authorise electricity supply authorities to exchange electrical energy when such an arrangement will avoid capital expenditure on extension of plant, which would be undesirable in view of the Shannon scheme. The special powers are to be applicable only until the Shannon supply becomes available to the authorised undertakers concerned. The Report stage was passed.

WATERFORD.—At a recent meeting of the Corporation, a report received from Messrs. McEntee & O'Kelly, consulting electrical engineers, Dublin, upon an electricity supply for the city, was adopted. The engineers were instructed to proceed with the preparations in connection with the scheme, which will involve an outlay of over £30,000. The engineers' report stated that in accordance with the condition laid down by the Department of Industry and Commerce, the scheme would be designed for incorporation with the national Shannon scheme in due course.

Leicester.—ELECTRICITY EXTENSIONS.—Mr. T. R. Smith, borough electrical engineer, has submitted a report to the Corporation, in which he states that it is estimated that the maximum load will reach 23,000 kW in December, and that, while the bulk of this load could be carried by the existing plant at the central station, there would be no spare plant available to meet emergencies. He has therefore recommended the installation of a further generating set. This, with other proposed extensions, would involve an estimated expenditure of £343,277, made up as follows:—11,000-kW turbo-generator with condenser, £89.277; concrete cooling towers, £29,000; mains to the end of 1927, £100,000; services for the years 1925-1926, £40,000; meters, 1925-1926, £20,000; sub-station requirements, 1925-1928, £65,000.

London.—BATTERSEA.—The Electricity Committee is applying for sanction to loans of £13,000 for mains and £7,000 for services.

Melksham.—INQUIRY DECISION.—Referring to the inquiry held at the Town Hall on October 7th by the Ministry of Transport into objections raised by local landowners to the proposal of the West Wilts. Electric Light and Power Co. to erect poles on their land in connection with the supply of electricity to a large area of Wiltshire, the Minister has given an award in favour of the company.

Middlesbrough.—FIRE.—A fire occurred at the North Tees power station of the Cleveland and Durham Electric Power Co., Ltd., at Haverton Hill, on November 26th. The oil around the switchgear in the switch-house became ignited, and the heat from the flames caused some of the oil storage tanks to burst, setting the whole of the building on fire. The generating station was not damaged, but the switch-house was gutted. Some inconvenience was caused to the majority of the large industrial concerns, as the supply was cut off as a safeguard, and numerous cables were also burned. A portion of the West Hartlepool tramway and parts of Middlesbrough and the whole of Stockton was affected. The damage is estimated at many thousands of pounds. Arrangements were made to supply consumers from the Grangetown and other stations of the company.

Parliamentary Bills.—Notice has been given by the following authorities of their intention to promote Parliamentary Bills in the ensuing session:—Oldham Corporation: to extend the borough so as to include the urban district of Chadderton, to extend its area of electricity supply so as to include this district, and to alter or repeal the powers of the Lancashire Electric Power Co., to supply therein. Horley District Gas Co.: to supply electricity in certain parishes in the rural districts of Reigate and Horsham, and to erect a generating station at Horley.

Preesall.—LOAN.—The Urban District Council is applying for sanction to a loan of £1,200 for laying a cable along Sandy Lane and Cartgate.

Rochdale.—ELECTRICITY IN BULK.—The Gas and Electricity Committee has reported to the Town Council that a provisional agreement has been made between the Bulk Supply Sub-Committee and the Lancashire Electric Power Co., to take a further bulk supply from the company, and also to extend the agreement until 1940.

South-East Lancashire Electricity Advisory Board.—We regret that an error occurred in the paragraph appearing under this heading on page 857 of our last issue. The proposal that the Board recommend to the Electricity Commissioners and the Eccles and Salford Corporations that the proposed contract between Salford and Eccles be approved, was contained in an amendment which was defeated, only 6 voting for it and 26 against. Accordingly the contract has not been approved by the Board, but the matter stands adjourned.

Special Orders.—Applications have been made to the Electricity Commissioners for Special Orders by the following authorities:—The Porthcawl Urban District Council, for the supply of electricity in its area; Wellington (Salop) Gas Co., in the urban districts of Wellington and Oakengates, and parts of the rural district of Wellington; Leeds Corporation, in the townships of Templenewsam and Austhorpe; Messrs. Callender's Cable & Construction Co., Ltd., in the parish of Chessington.

South Shields.—LOAN.—The Electricity Committee is to apply for sanction to a loan of £10,000 in connection with the "assisted-wiring" scheme.

Thornthwaite.—ELECTRICITY SUPPLY.—A company has been formed for the purpose of supplying electricity to the villages of Thornthwaite and Braithwaite. Plant has been installed at a disused lead mine, and water power will be used for generating purposes. The supply will be by means of an overhead cable.

United States.—HYDRO-ELECTRIC DEVELOPMENT.—A *Reuter* message from Washington says that in its annual report, issued on November 22nd, the Federal Power Commission states that the greatest water-power development in American history has occurred during the last five years. Applications for power developments during this period will involve, when built, an aggregate estimated installation of 24,000,000 h.p.

Upper Airedale.—NEW SUB-STATION.—The Yorkshire Electric Power Co. has arranged to purchase land at Silsden for the erection of a sub-station which will become a main distributing centre for the north-western part of the company's area and for the supply of electricity to towns and factories in the Craven district of Upper Airedale. Mains are already being laid through Addingham and Silsden to connect with the existing mains to the east and the west, and the scheme will provide an alternative source of supply to Skipton direct from the company's system.

Walton.—PURCHASE OF UNDERTAKING.—The Urban District Council has considered a proposal to purchase the local electricity undertaking of the Urban Electric Supply Co., Ltd., and has instructed its accountants to investigate the accounts of the company with a view to purchasing the undertaking in the event of no satisfactory arrangement being made with the company for it to continue the undertaking for a further period.

Warrington.—YEAR'S WORKING.—The accounts of the Corporation electricity undertaking (engineer: Mr. F. V. L. Mathias) for the year ended March 31st last show a total revenue of £108,499, as compared with £101,205 in the preceding year. Working expenses amounted to £68,709, as against £56,875, leaving a gross profit of £39,790 (£44,330), to which was added interest on investments and bank interest, making a total of £41,330. After providing for capital and other charges, a net profit of £8,294 remained, as compared with £10,753 in 1923-24. The capital expenditure during the year, which included £16,670 for mains and services, amounted to £31,279. The sales of electrical energy (excluding tramway supplies) increased from 14,518,192 to 15,600,974 kWh, and the maximum supply demanded from 6,700 to 7,300 kW. During the year the second 6,000-kW turbo-alternator was completed and put into commission.

Welwyn.—PRICE REDUCTIONS.—The Welwyn Garden City Electricity Supply Co. has announced the following reductions in the charges for electricity as from January 1st next:—Prepayment meters: From 1s. to 10d. per kWh. Domestic purposes: Summer quarters—first 25 kWh per quarter, 3¾d. per kWh, and all additional energy, 1d. per kWh; winter quarters—first 50 kWh per quarter, 3¾d. per kWh, and 1d. per kWh thereafter. Reductions have also been made in the charges for industrial and commercial purposes.

Tramway and Railway Notes.

Australia.—MELBOURNE.—We have received from the Melbourne and Metropolitan Tramways Board a copy of the report on the working of its undertaking for the year ended June 30th last. The electric tramways earned a total revenue of £756,163, an increase of £69,884 as compared with the preceding year. The working expenses amounted to £649,644, as against £576,427, leaving a gross profit of £106,519 (£115,792). This was carried to net revenue account with gross profits of £180.473 from the cable tramways and £3,224 from the motor-omnibuses, making a total of £290,217 available. Capital charges, &c., absorbed £172,705, and a balance of £117,512 was transferred to appropriation account. After meeting statutory payments to State consolidated revenue and reserves, there was a net deficit of £232,245. The number of passengers carried by the electric tramways increased from 74,091,564 to 80,435,680, and the car-mileage from 7,267,966 to 8,426,519. During the year nearly seven miles of electric tramway track was completed, and plans and specifications were prepared for the conversion to electric traction of the St. Kilda, Chapel Street, Victoria Street, and Richmond cable tramways. Six sub-stations were put into service during the year, and contracts were placed for six 1,000-kW rotary converters, with automatic switchgear, for St. Kilda, Carlton, and South Melbourne sub-stations.

Blackpool.—NEW CARS.—In connection with the Promenade tramway extension at South Shore, the Tramways Committee has decided to purchase 12 new tramcars.

Colne.—ABANDONMENT OF ROUTE.—At a meeting of the Town Council on November 26th, the engineer reported on the condition of the tramway track between the depôt and Laneshaw Bridge, and upon the cost of reconstruction. It was decided to make application to the Ministry of Transport for sanction to discontinue the light railway and to remove the rails.

Continental.—SWITZERLAND.—The Olten-Berne section of the Swiss Federal railways has now been electrified, and the official trials recently took place. The energy for the Olten-Herzogenbuchsee section is obtained from the Gothard group of power stations, while the section, Herzogenbuchsee-Berne, is supplied by the central power station at Muhleberg. The next section to be electrified will be the line between Lausanne and Geneva, while at the beginning of 1926 the section between Lausanne and Palézieux will also be completed. The Palézieux-Berne and the Winterthur-Rorschach sections will be electrified in 1927, and it is estimated that the cost of electrification up to the end of 1928 will be 80,000,000 fr. less than had been estimated two years ago.

FRANCE.—A syndicate has been formed with the object of constructing an electric railway between the Paris-Orleans railway at Bretigny and the motor-racing track at Linas-Montlhéry.

ITALY.—The steam tramway between Rome and Tivoli is to be converted to electric traction.

AUSTRIA.—The last section of the tramway in Vienna to be electrified has recently been completed and opened for traffic.

Dutch East Indies.—JAVA.—The Allgemeine Elektricitäts Gesellschaft, of Berlin, has recently dispatched the last two of the three electric locomotives which it has built for the Java State railways. The engines are stated to develop 1,600 h.p. and to be capable of hauling a train at a maximum speed of 56 m.p.h. The driving wheels have a diameter of 4 ft. 6 in., and the overall length of the engines is 46 ft.

Japan.—TOKIO.—According to *Eastern Engineering*, the revised plan for the construction of subways in Tokio, calling for y.187,000.000, was to come up for discussion by the Tokio Municipal Assembly this month. According to the new plan, construction would begin next year with an appropriation of y.5,500,000 and continue until 1938, when the entire undertaking would be completed. It is estimated that the construction costs will be about y.4,500,000 per mile. During the first year only one mile of the tube would be completed, while during 1927 and 1928 three miles would be completed. From 1928 to 1937 three and a-half miles are scheduled for each year, and about three miles for the final year. The first line of the system would be built from Shibuya to Sugamo through Tokio station, while the second would run from Ikebukuro to Susaki through Tokio station. The third is expected to be from Shinjuku to Otsuka, and the fourth from Gotanda to Oshiage, both of which would pass through Tokio station, making this station the central point of the subway system.

KOBE.—The committee appointed by the Municipal Council to investigate plans for the reconstruction of the railways running through the city has decided to support the plan of Dr. Morigaki, chief of the Kobé City Planning Department, which provides for the adoption of an underground system. According to this plan the present lines between Hiogo station and Kasugano-michi will be placed underground, but it is first necessary to obtain the approval of the Railway Department. It has therefore been decided to send seven commissioners to Tokio to negotiate with the railway authorities.

Halifax.—FARES.—The reduction of fares on the Corporation tramway, made last April, resulted in a loss up to the end of October of £14,000, and the Council is to be recommended by the Tramways Committee to revert to an increase of fares.

London.—NEW UNDERGROUND SUB-STATIONS.—Work on the construction of the new sub-station building which adjoins Lambeth North station has commenced. When completed this sub-station will house two 1,500-kW rotary converters, and will be "remote controlled" from Charing Cross. Two other sub-stations are also being erected at Balham and South Wimbledon for serving the Morden extension tube which will open next midsummer. The first-named building is nearly finished, and an overhead crane has been installed. The bedplates for the three 1,200-kW rotary converters and the ventilating plant are now being installed. Good progress also can be recorded at South Wimbledon. The building is nearly complete, and most of the equipment has been delivered and will be installed within the next few weeks.

Mexborough.—RAILLESS CARS.—The Mexborough and Swinton Tramways Co. is to promote a Parliamentary Bill to institute a new railless-car service from New Conisborough to Manvers Main Colliery, near Wath, to abolish a number of tramway routes in Mexborough, and to substitute a railless-car service.

Telegraph and Telephone Notes.

Austria.—AUTOMATIC TELEPHONY.—According to the recently-issued report for 1924 of the Austrian Post and Telegraph Department, the conversion of the Vienna telephone service to full automatic working has practically been completed, there being now 70,700 connections. Good progress in the same direction has also been made in Gratz, which has now 5,200 automatic connections, while the conversion of the exchange in Linz to automatic operation is well in hand. At the end of the year there were 376,180 miles of telephone wires in operation in the country. During the year new international telephone lines were opened between Vienna and Trieste, Prague and Trieste, and Innsbruck and Munich.

Germany.—Gale Damage.—It is reported that three of the new 400-ft. masts of the Norddeich radio-telegraph station, which is controlled by the German Government, were blown down in a gale last week.

Italy.—United States Syndicate's Deal.—The American syndicate which is negotiating with Turin and Milan for the installation of telephones in those two cities is reported by the *Financial Times* to be the Theodore Gary Company, of Kansas City, which controls the Automatic Electric Incorporated Company, of Chicago.

Submarine Telephone Cable.—The Pirelli Co., of Milan, has recently laid a telephone cable across Lake Maggiore between Intra and Laveno.

Jugo-Slavia.—Telephone and Telegraph Systems.—When the new State (the Kingdom of the Serbs, Croats, and Slovenes) was created, its telephone and telegraph lines were in complete disorder, and the entire pre-war system in Serbia had been destroyed. Consequently, the Jugo-Slavian Ministry of Posts and Telegraphs had to practically rebuild the systems. The services now rendered are adequate, and not only are all centres of the country connected by wire, but Belgrade and Zagreb have direct lines to the capitals of all the neighbouring countries, except Italy, this line extending only to Trieste. At the end of 1924, according to *Commerce Reports*, there were 14,605 kilometres of telephone lines with 27,457 subscribers, and 20,039 kilometres of telegraph lines. Since 1921 new telephone lines have been put in service between Belgrade and a number of cities, and it is said that 27 telephone and telegraph lines are now under construction.

Automatic Telephony.—The Prague telephone system is to be changed from manual to automatic; present plans call for the installation of 4,000 new instruments in the city by January 1st, 1926, and a like number in each of the city sections called Vinohrady and Smichov.

Marine Radio Operators.—Strike.—A wages dispute has arisen between the Engineering and Allied Employers' Federation (London and District Association) and the Association of Wireless and Cable Telegraphists, and a strike of ships' operators was declared on November 26th. Most of the operators are trained and supplied to the shipping companies by the Marconi and Radio Communication Companies. The Board of Trade has instructed its officials not to refuse clearance certificates to ships which cannot secure the services of operators owing to the strike. The dispute arose in consequence of a proposal to reduce wages by 22s. 6d. per month. The present commencing wage for men is £8 17s. 6d. a month, rising to £20 at the end of nine years' service.

Sweden.—Automatic Telephony.—The installation of the automatic telephone system in Stockholm in place of the old system of manual service continues. The Telegraph Board has just given an order to Telefonaktiebolaget L. M. Ericsson for another station for Stockholm with an entirely automatic service to serve 15,000 subscribers. The price will be kr. 2,300,000, and the time of delivery eighteen months.—*Reuter's Trade Service* (Stockholm).

The Telephone Service.—Leeds-Glasgow Trunk.—The Postmaster-General announces that trunk telephone communication between Leeds and Glasgow has recently been materially improved by bringing into service between those towns additional circuits in a new underground cable.

Venezuela.—Automatic Telephony.—The Government of Venezuela recently granted a concession to a Venezuelan citizen to install and operate an automatic telephone system throughout the country. Work must begin within six months.

Radio Notes.

Germany.—Aerial Regulations.—Police regulations issued for Berlin and Potsdam concerning the erection of roof aerials seem likely to handicap the development of broadcasting there. According to the *Evening News*, it is laid down that: Police permission must be obtained before a roof aerial may be mounted. The request must be made in writing, together with a plan and description in duplicate, giving all details of the proposed construction: its distance from other buildings and properties, and from high- or low-power cables. On demand, proof of the firmness of the material and construction must be given. Within three days after completion, the police must be informed in writing, and asked to test the construction. The aerial must not be used until the final permit is issued, and it must be constructed of copper, bronze, or aluminium of a certain tensility, and must pass a certain temperature test. For the puzzlement of the unlearned, mathematical formulæ are added.

Tramway Interference.—Early in 1924 the Berlin Tramway Co., in conjunction with the telegraph authorities, carried out experiments concerning the causes of interference with broadcast radio-reception, and came to the conclusion, according to *E.T.Z.*, that the chief cause of the trouble was the interruption of the small lighting current used in the tramcars. The motors themselves are also audible, but not to any objectionable extent if they are in good working order. The safest cure for the trouble, failing a complete reconstruction of the collecting gear, was found to be an increase in the lighting current from the existing value of 0.6 ampere to something like 2½ amperes. Following the publication of these results, further experiments were carried out in Halle, and it was there found that a further aid was the connection of condensers of considerable capacity between the collecting gear and earth, *i.e.*, in parallel with the lamps. When tried in Berlin, the same good results were found when condensers of some 30 microfarads capacity were employed. Experiments were next made in a number of other towns in which the tramways employ bow collectors of aluminium instead of the roller (trolley) collectors used in Berlin. In all these cases it was found that the condensers, instead of curing the trouble, produced hardly any effect at all. Inquiries made in other towns, such as Frankfort (on Main), in which the tramcars employ bow collectors fitted with carbon contact surfaces, showed that no interference with wireless reception occurs there, and this result was confirmed in Berlin and in Halle by the behaviour of experimental cars fitted with such carbon collectors. It would seem, therefore, that the best all-round cure for tramway interference would be to fit all cars with carbon collectors, an arrangement which should also meet with the approval of the tramway authorities themselves, as it would tend to reduce the wear on the overhead trolley lines. In the meantime the telegraph authorities are carrying out further experiments with a special car arranged to work with collectors made of various materials.

Paraguay.—Proposed Broadcasting Co.—Interest in radio broadcasting in increasing, and *Commerce Reports* understands that the Ministry of War and Marine has decided to purchase equipment, although the decree authorising this action has not yet been signed. The organisation of a broadcasting company, which the municipality of Asuncion has been asked to subsidise, has also been proposed.

United States.—New Stations.—The new high-power station at Round Brook, New Jersey, which will shortly be operating on a power of 50 kW, carried out experiments on part power (35 kW) during the night of November 25th-26th. The wave-length was 455 metres and the call sign W J Zee. America is preparing for international broadcasting by building at Belfast, Maine, a receiving station, a novel feature of which will be a short-wave wireless link with the high-power station. Belfast, Maine, will thus pick up the Daventry programmes and relay them on a short wave to New Jersey, which station will broadcast the programmes all over the United States.—*Daily Mail.*

Safer Aerials.—Following several fatal accidents in New England due to the improper erection and construction of radio aerials, the Worcester (Mass.) Electric Light Co. has offered to make a free inspection of outside strung wires upon request of the owners. About fifty aerials have been inspected in one month from the standpoint of eliminating the hazards of too close proximity to primary and street-lighting circuits, attachment to company poles, and dangerous relationship to other wiring, says the *Electrical World*. The Hartford (Conn.) Electric Light Co. has announced to its employés that to encourage constant watchfulness against aerials attached to the company's poles, or erected over any of its wires, the company will pay after verification $5 to any employé reporting such an installation.

St. Marylebone Revisited.

Post-War Extensions of a 45,500-kW London Generating Station.

THE normal rated capacity of the generating plant in the St. Marylebone Borough Council's electricity works is now 45,500 kW. This West London station, situated quite close to the power house of the Central Electric Supply Co., Ltd., contains five 2,000-kW tandem d.c. Parsons steam turbine sets, installed during 1905-6 when the station was built and the undertaking purchased by the Council was taken over from the Metropolitan Electric Supply Co. Two 3,500-kW, 3-phase, 6,600-V, 3,000-r.p.m. Oerlikon turbo-alternators were added in 1913, whilst the post-war extensions consisted of two 8,000-kW, 3,000-r.p.m. sets (one G.E.C. and one Oerlikon) installed in 1921-2 and a 12,500-kW, 3,000-r.p.m. G.E.C. set which was erected during the current year on a site formerly occupied by four 500-kW d.c. Parsons sets in the original lay-out, which have been scrapped.

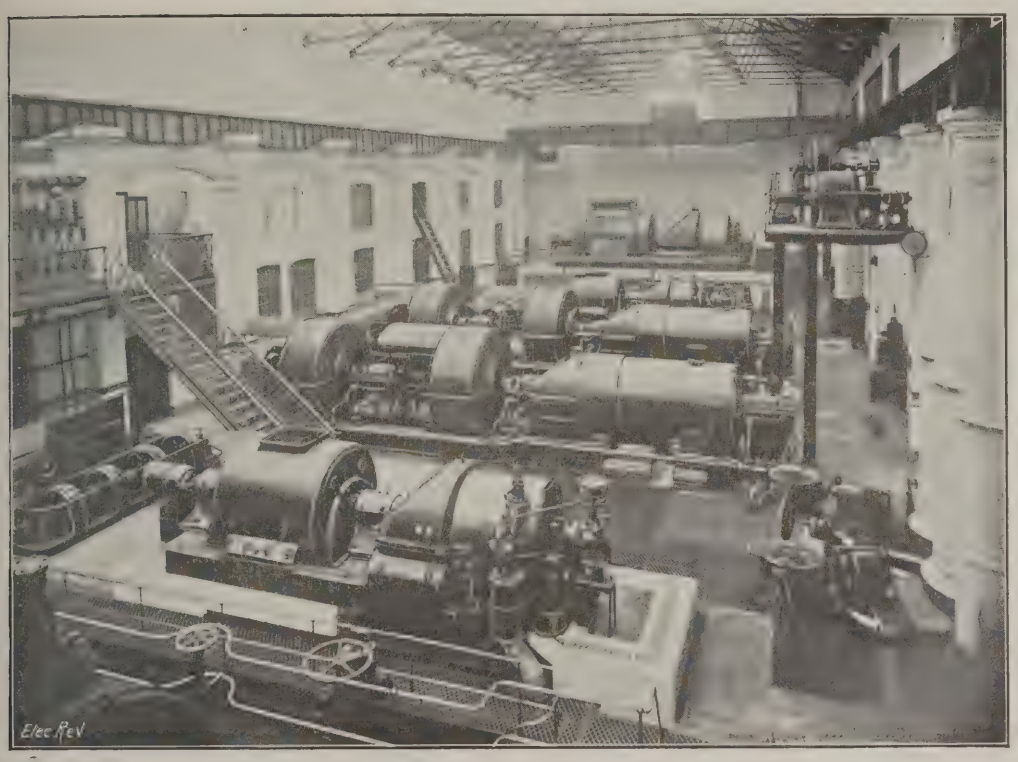

Fig. 1.—View of Half the Turbine House at St. Marylebone.

This set is to be seen at the far end of fig. 1; it is capable of a max. continuous output of 19,550 kVA at 0.8 p.f. when the steam pressure is 20 lb. lower than that specified, the exhaust opening being designed to take advantage of vacuum conditions up to 28½ in. In connection with the publicity given to the road transport of the alternator from Witton, the handling of this 70-ton machine at the generating station was dealt with by a 3-motor, 60-ton overhead travelling crane, supplied by Messrs. Herbert Morris, Ltd.

The turbines installed during the post-war extensions are built for a stop-valve gauge steam pressure of 340 lb. per sq. in. and a total temperature of 680 deg. F., but until sufficient high-pressure boiler plant is available they have been adapted to run efficiently at 190 lb. pressure.

The surface condensers for the three large turbines, by Messrs. Worthington-Simpson, maintain a vacuum of 27½ in., bar. 30 in., when supplied with circulating water at an inlet temperature of 80 deg. F. The air-extraction and condensate-discharge pumps for each set are driven by duplicate motors with Wigglesworth clutches.

The two G.E.C. alternators have external ventilating fans, also provided with duplicate motors and clutches, and the 8,000-kW alternators are fitted with Heenan and Froude closed-circuit air coolers, the 12,500-kW alternator having a Premier cooler. The addition of coolers has brought about a marked improvement in the temperature of the turbine house, and they are effective "silencers."

Fig. 2.—The other Half of the Turbine Room, showing D.C. Switchboard.

A new wing, fig. 4, parallel to the existing boiler house contains two 40,000-lb. and two 60,000-lb. Babcock & Wilcox cross-type marine boilers, with Hopkinson mountings, constructed for an ultimate working pressure of 350 lb. per sq. in. and a total temperature of

700 deg. F. Each boiler has a superposed steel-tube economiser, induced-draught fan, steel chimney, Davidson volute soot and grit catcher, and Underfeed forced-draught travelling grate stokers, and similar stokers have been installed under six of the original boilers, increasing the grate area and nominal steaming capacity from 18,000 to 22,000 lb. per hour. A feature of the larger boilers is the introduction of dampers to control the superheat temperature. During the war period another six of the original battery of twelve boilers were fitted with Underfeed stokers with external forced-draught plant, and coke breeze, which was then obtainable at reasonable prices, was largely burnt at this station. There are also two 20,000-lb. Babcock marine-type boilers with chain-grate stokers, which were added during the interim period before the first post-war extension programme was proceeded with. Some of the induced-draught boiler fans are driven by motors mounted on staging in the turbine room, as shown in figs. 1 and 2. Wright draught gauges and Gordon Mono CO_2 and CO recorders have been fitted for the original as well as for the new boilers.

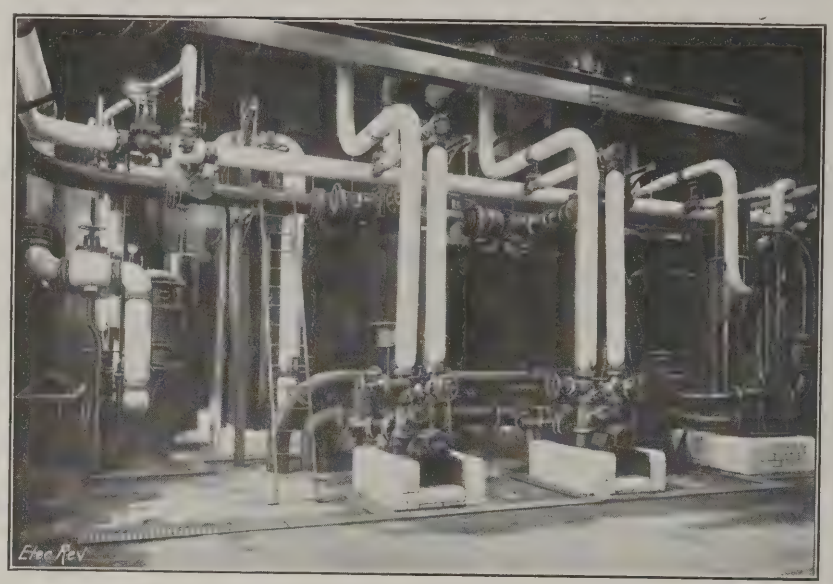

Fig. 3.—Part of New Boiler Feed Pump House.

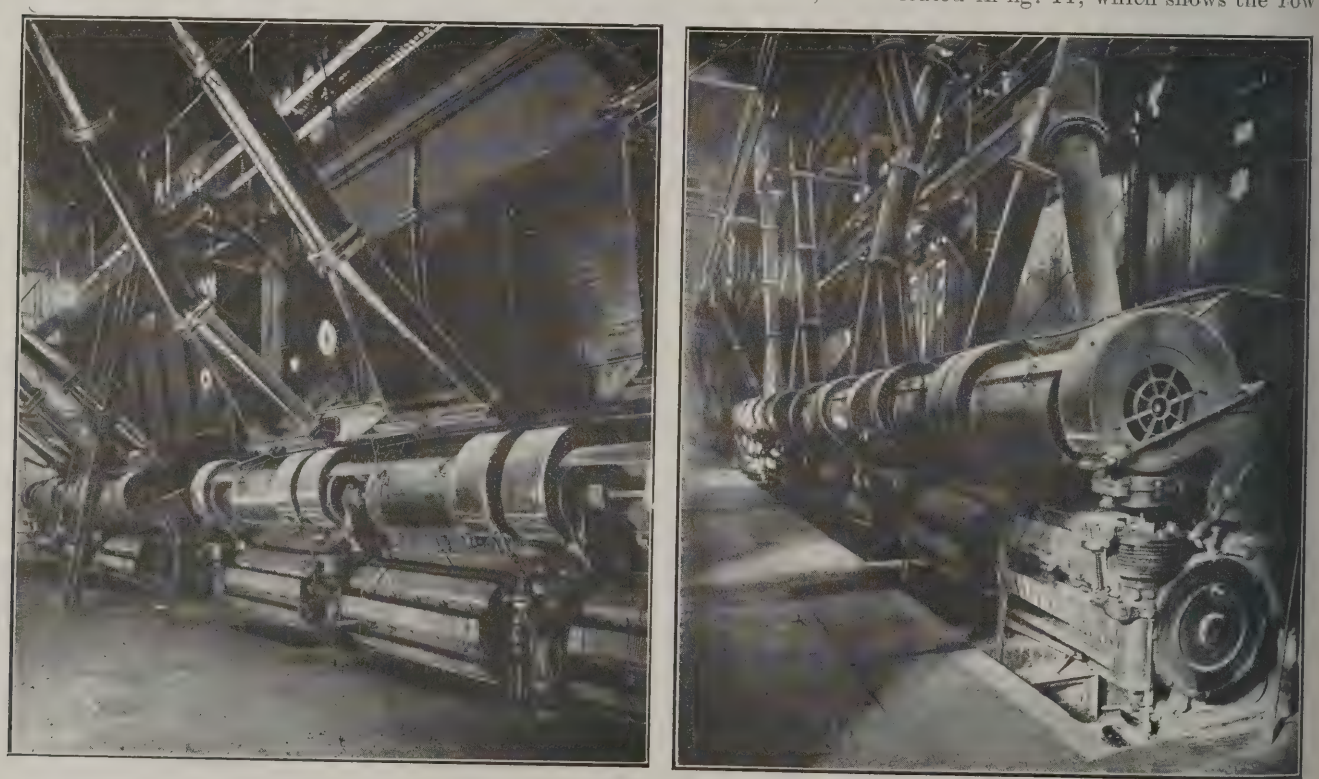

The clinker and ashes are conducted from the ash hoppers into a trough in the basement and carried to an 80-ton reinforced-concrete bunker by a water-flushing system installed by the Underfeed Stoker Co., Ltd. This system has been also extended to the original boiler house to replace a drag conveyor. The motor-driven non-chokable pumps are shown in fig. 10, and the complete absence of noise, dust, and fumes is a satisfactory feature of such plant, particularly in a generating station situated in a densely-populated residential area; although these advantages are slightly offset by a small percentage increase in the weight of ashes discharged to barges in the Regent's Canal alongside, the requirements of the site justify this minor addition to the running costs.

The steam mains are so laid out that steam from the high-pressure boilers can be supplied to the low-pressure steam mains by cross-over connections fitted with reducing and straight-through valves, the l.p. mains being fitted with relief valves to guard against excess pressure.

Fuel is drawn from overhead bunkers in the original boiler house, which are filled from barges alongside by a 20-ton per hour travelling electric crane and a bucket elevator, and a 5 ton, 4-motor, 60-ton per hour travelling electric lever-type crane having a 65-ft. jib, and balanced luffing gear by Messrs. Babcock & Wilcox; it is erected on a raised gantry, as shown in fig. 11, and discharges through an Avery 3-ton weighing machine to the belt conveyor. In view of the importance of minimising noise and dust, suction plant was tried for this duty, but the system did not come up to requirements and has been removed.

The practice of erecting cooling towers on the boiler-house roofs, as indicated in fig. 11, which shows the row of fans in the towers, has been again followed, and two large forced-draught towers have been installed by the Clyne Engineering Co., of Manchester. The smaller tower is of 420,000 and the larger of 1,800,000 gal. per hour capacity. The total tower capacity is now 3,100,000 g.p.h., and, we understand, forms one of the largest forced-draught installations in the country.

Condenser circulating water is also drawn from the Regent's Canal, and provision has been made for any

Figs. 4 and 5.—Views of Parts of the New (left) and Original (right) Boiler Houses.

turbine set to be run on either tower or canal water. The discharge pipe line to the canal has been extended a distance of 960 ft. from the intake dock, thereby more than doubling the condensing capacity of the canal, which is now capable of dealing with loads up to 15,000 kW with a considerable saving in electricity used for

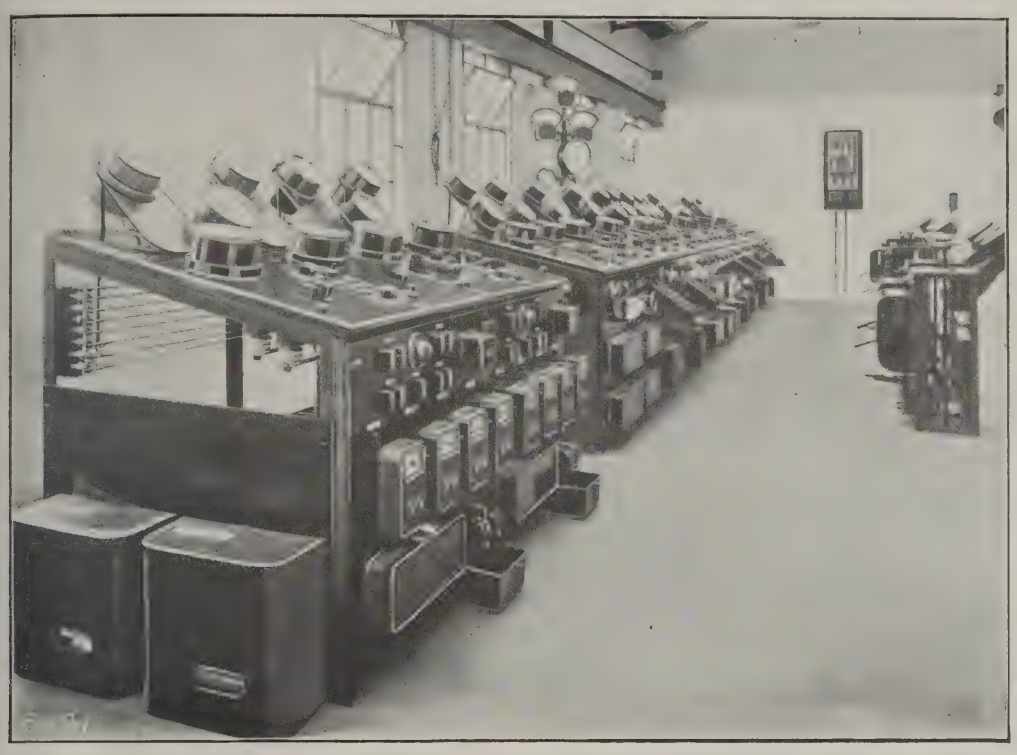

Fig. 6.—Main Switch Control Desk, Bulk Supply Panels in Foreground.

auxiliaries. Blakeborough motor-driven valves are used for all circulating-water mains from 27 in. upwards. Patterson " Chloronome " apparatus has been provided for treating the canal water, and a Bowes-Scott & Western 46,000-g.p.h. water-softening and filtration tower in reinforced concrete is in course of erection (to the left of the crane in fig. 11) for dealing with the make-up to the cooling towers and for boiler-feed purposes.

In the centre of the new boiler-house wing is a large feed-water pump room, fig. 3, which accommodates four 15,000- to 20,000-g.p.h. turbine pumps, and two sets of 300,000-lb. Weir de-aerating plant; the hot wells (scaled for turbine testing); feed-water heaters (into which all steam pumps exhaust); Lea recorders for measuring the condensate; and forced-draught fans for the original boilers. Overhead are water-treating and reserve tanks for the make-up feed water, a mixture of artesian well and canal water being found most suitable.

With the exception of the steam feed pumps and a stand-by steam-driven extraction pump for the 12,500-kW turbine set, all auxiliary plant is electrically driven, there being a total of 177 motors aggregating 6,378 h.p.

Attention is given to combustion details, and instructive records show the benefits of close supervision. This undertaking has a large lighting, heating, and cooking load, and the influence of weather conditions, particularly during the construction period of the last few years, in a measure delayed full benefit being obtained from these additions until the reserve margin of steaming and generating plant had been increased. Yearly improvements are shown, and their cumulative effect will shortly give more favourable returns, as can be seen from the following.

There is only one private generating plant left in the area, and terms have been agreed to for its replacement. St. Marylebone is a purely residential and shopping centre in the heart of the West End of London, and notwithstanding the handicap of £1,000,000 paid for goodwill, has steadily improved its position: 74 per cent. of consumers are obtaining supply at 25 per cent. below, and a further 14 per cent. at 16 per cent. below, pre-war prices; the remainder are at or about the same level. Hire and hire-purchase schemes have also largely assisted, and further developments may shortly be introduced in this direction.

An agreement has been entered into with the Cen-

Figs. 7 and 8.—Two Views of the Ferguson-Pailin High-Pressure Switchgear at St. Marylebone.

tral Electric Supply Co. for purchase and reciprocal supply in bulk up to 10,000 kW (15,000 kW in emergency), this move being influenced by the setting-up of the London and Home Counties Joint Electricity Authority and the possibility of transfer of the generating station "without adequate return being obtained for the capital expended." The agreement is determinable at any time after 1931, and it will be of interest to observe what course will be pursued when further plant is required.

There is space for extension of the boiler house into the Council's Works Department's yard, which adjoins, and the site can be further extended by the purchase of small property in the vicinity; this, however, would raise the problem of alternative accommodation for the dishoused, and is not likely to be pursued for a time. The turbine room will house another four 12,500-kW sets by the displacement of existing d.c. plant, and there is ample room for switchgear at the rear of the present d.c. switchboards, shown in fig. 2, which would be removed. The d.c. sets are now used mainly as reserve plant, and for all practical purposes three-phase, a.c. generation has been adopted.

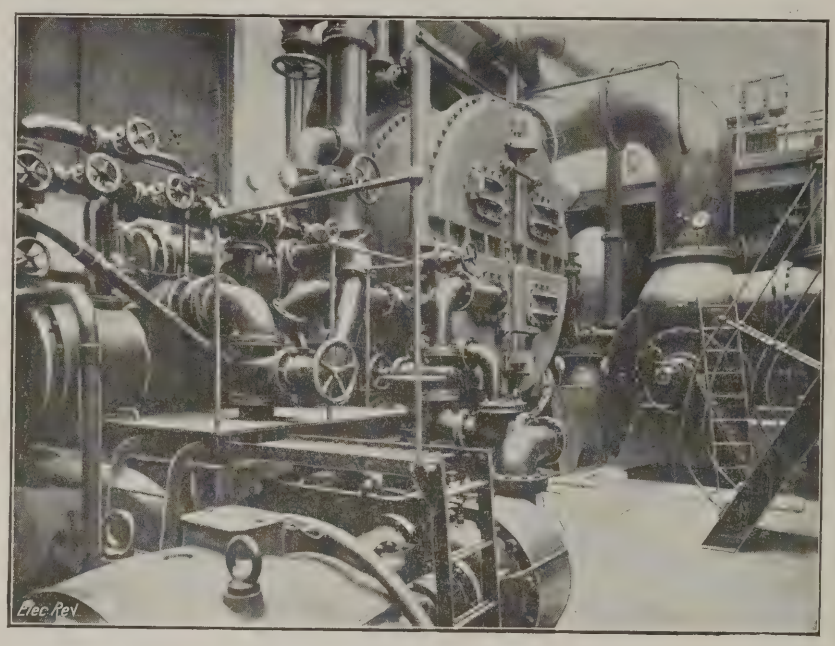

Fig. 9.—Condensing Plant for New 12,500-kW Set.

Mention should be made of the interesting installation of e.h.p. remote-operated, armour-clad, compound-filled switchgear, consisting of 17 duplicate-busbar units, manufactured by Messrs. Ferguson, Pailin, Ltd.,

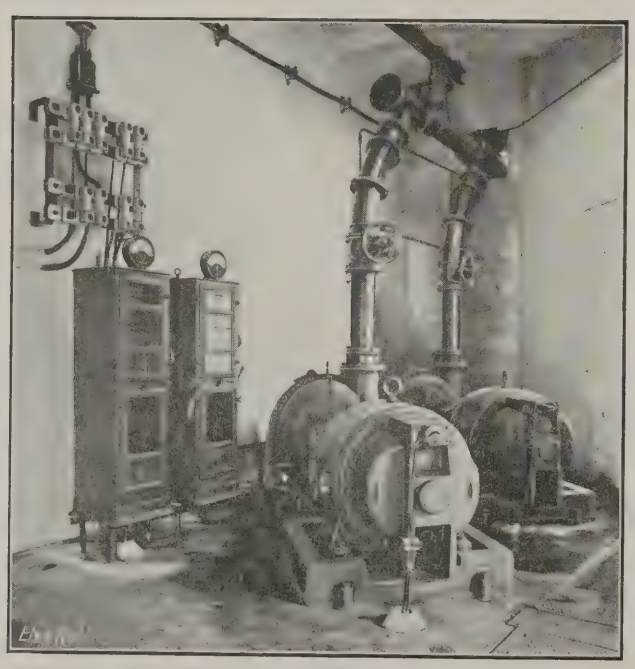

Fig. 10.—Non-Chokable Ash Pumps.

which have been erected on the ground floor, figs. 7 and 8, on sites formerly used as a workshop and general office, with a desk board and exciter pillars in a control room above, fig. 6, overlooking the engine room; the small board in the foreground controls the bulk supply.

These large switches have a rupturing capacity of 750,000 kVA and replace, in part, the original cubicle gear. Armour-clad equipment of the same make is in use in the sub-stations, with truck-type cubicle gear for transformer stations on consumers' premises, and the l.p. switchgear for the rotary converters.

A new spacious workshop, stores, and administrative block includes, on the top floor, a mess room with steam and Jackson electric cooking equipment, men's locker room, lavatories, shower baths, and a testing laboratory.

There have been considerable additions to the rotary-converter plant: Two 2,000-kW, 375-r.p.m. G.E.C. sets have been installed at the generating station, and four 1,500-kW, 500-r.p.m. Metropolitan - Vickers and one 2,000-kW, 375-r.p.m. G.E.C. sets in the two sub-stations, together with e.h.p. transmission and l.p. feeder extensions from and to these centres. The e.h.p. cables have been supplied by the British Insulated and Helsby Cables, Ltd., and the l.p. cables by the Enfield Cable Works, Ltd. Beard - Hunter and Ferranti-Hawkins protection is used for the e.h.p. system, and Merz-Price protection for the alternator cables.

Large stores and drapery establishments have been, or are in process of being, changed over to a.c. supply, each supplied from a looped e.h.p. service with Scott-connected air-cooled Berry transformer groups, in some cases up to 1,500 kVA capacity. To minimise transformer losses, arrangements have been made for transferring these installations to the 3-wire d.c. service when the businesses close down.

During the year ended March, 1919, the maximum load was 10,070 kW and the energy sold amounted to 16¼ million kWh, whereas the maximum load recorded last winter totalled 28,003 kW, and the output 50.7

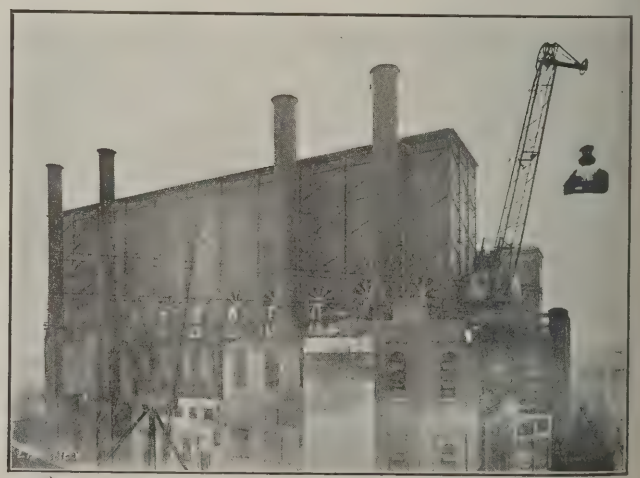

Fig. 11.—Forced-Draught Cooling Towers.

million kWh sold; it is expected this winter to reach 32,000 kW, with sales approaching 60 million kWh, surely a record in progress for an undertaking in this category without the support of large industries.

Bulk supply to Hampstead accounted for 6,270 kW and 13.3 million kWh of the output of 1924-5.

We are indebted to the chief engineer, Mr. C. H. Smyth, and his chief assistant, Mr. F. B. Leonard, for the details set out above.

Australia.—SYDNEY.—Electricity Supply Committee. Recommended:—

33,000-V lead-covered cable (spec. 936) (£11,433).—Noyes Bros. (Sydney), Ltd.

Maximum demand indicators (spec. 955) (£6,231).—Edison Swan Electric Co., Ltd.—*Tenders.*

BRISBANE.—Tramways Trust.

42 traction motors.—Australian General Electric Co., Ltd.

Bexhill.—Electricity Committee. Recommended:—

1,250-kW converter, with h. and l.p. cabling (£4,700).—Bruce Peebles and Co., Ltd.

New d.c. switchboard and switchgear (£2,522).—A. Reyrolle & Co., Ltd. Cable.—(£74 and £421).—Enfield Cable Works, Ltd.

Bristol.—The contract for the Corporation scheme of electricity extensions, at an approximate cost of £1,000,000, has been placed with Vickers, Ltd., in conjunction with the Metropolitan-Vickers Electrical Co., Ltd., subject to the approval of the Electricity Commissioners.

Calne.—Town Council. Accepted:—

Laying cables, &c. (£1,571); in connection with the electricity scheme.—Siemens Bros. & Co., Ltd.

Glasgow.—Tramway Committee. Accepted:—

Switches.—W. McGeoch & Co., Ltd.

Carborundum blocks.—W. Gray & Co.

The manager recently reported on the offers received for the supply of trolley wire, and it was moved that the offer of Messrs. W. M. McIntyre & Co. (for German wire), amounting to £984, being the lowest, be accepted. There was an amendment that the offer of Messrs. Thomas Bolton & Son, amounting to £1,051, being the lowest British offer, be accepted. Eleven voted for the motion and eight for the amendment. When the recommendation to purchase German trolley wire came before the Council last week it was stated that the deliveries from the Continent were irregular, and as the Department was in want of the material and it could be obtained from the contractor who submitted the lowest British tender within seven days, it was decided to accept this tender.

Hull.—The Corporation Telephone Committee on Wednesday last week decided to accept two tenders for German-made cable and wire. In one case the price per ton was £66, against £81 the lowest British tender, and in the other case the price quoted for four tons of bronze wire was £369, against £414 the lowest British offer. Mr. Mallory said that the makers of the German wire would have the advantage of a royalty from their Government. It was also urged that it was economically unsound to send work abroad when taxation, consequent upon unemployment, was high in this country.

The Lord Mayor said that if the Corporation was not disposed to accept tenders for foreign goods, it should restrict tendering to British firms.

Irish Free State.—The following contracts were among those placed by the Controller of Stores, Department of Posts and Telegraphs, from October 28th to November 22nd:—

Telephone fuses.—Phœnix Telephone & Electric Works, Ltd.

Heat coils.—Walters Electrical Manufacturing Co., Ltd.

Telephone headgear receivers.—British L. M. Ericsson Mfg. Co., Ltd.

Telephone cords.—Phœnix Telephone & Electric Works, Ltd.; London Electric Wire Co. and Smiths, Ltd.

Telephone keys.—Phœnix Telephone & Electric Works, Ltd.; Sterling Telephone & Electric Co., Ltd.—*Irish Builder and Engineer.*

Installation of two telephone exchanges.—Standard Telephones & Cables, Ltd.

London.—GENERAL POST OFFICE.—Accepted:—

60,000 telephone switchboard lamps.—General Electric Co., Ltd.

500 fuseboards.—Edison Swan Electric Co., Ltd.

Fifty 120-watt generating sets for telephone service.—Stuart Turner, Ltd.

ADMIRALTY.—Accepted:—

6,000 terminal blocks, 4,600 switches.—Edison Swan Electric Co., Ltd.

PADDINGTON.—Borough Council. Accepted:—

Three years' maintenance of the Council's electric lighting, power, telephones, &c., in the Town Hall and other buildings.—Cunningham, Ltd.

UNDERGROUND ELECTRIC RAILWAYS CO. OF LONDON, LTD. Equipment for semi-automatic sub-station at Lambeth North in connection with the Kennington loop line:—

Two 1,500-kW rotary converters, &c.—British Thomson-Houston Co., Ltd.

Morecambe.—In a recent report to the Electricity Committee, the borough electrical engineer stated that the British prices for electricity meters were greatly in excess of those quoted by Continental firms, and he asked for instructions as to the purchase of these. The Committee has authorised him to purchase meters in the most economical market, despite a feeling of regret at taking such a course under the present circumstances of British trade.

Manchester.—Electricity Committee. Accepted:—

Heating installation, Polygon depôt.—Henry Tattersall, Ltd.

Two 500 kVA static transformers for Hetherington & Son's sub-station.—General Electric Co., Ltd.

Nottingham.—Tramways Department. Accepted:—

Ten covered low-loading type double-deck railless cars, each seating 52 passengers.—Railless, Ltd.

Salford.—Tramways Committee. Accepted:—

Eight pairs of tramway points (£676).—Hadfields, Ltd.

Twelve tramway crossings (£324).—Thermit, Ltd.

Electricity Committee. Accepted:—

914 yd. e.h.p. lead-covered cable (£914).—W. T. Glover & Co., Ltd.

Sheffield.—Electric Supply Committee. Accepted:—

Two 500-kVA Scott-connected transformer sets; one 250-kVA and six 100-kVA single-phase ditto (£2,002).—British Electric Transformer Co., Ltd.

Six 11,000-V switch-fuse sets (£452).—A. Reyrolle & Co., Ltd.

Stoke.—Electricity Committee. Accepted:—

Wiring offices in Broad Street, Hanley (£110).—J. Bagguley & Son.

Willesden.—Electricity Committee. Recommended:—

1,000-V Megger testing instrument.—Evershed & Vignoles, Ltd.

Forthcoming Events.

Nottingham Society of Engineers.—Friday, December 4th. At Victoria Station Hotel, Nottingham. At 7.15 p.m. Annual dinner.

Electrical Power Engineers' Association (Southern Division).—Friday, December 4th. At E.L.M.A. Lighting Service Bureau, 15, Savoy Street, W.C.2. At 7 p.m. Lecture on "Some Principles of Electric Illumination," by Mr. W. J. Jones.

Society of Engineers.—Monday, December 7th. At Burlington House, W. At 5.30 p.m. Ordinary meeting.

Institution of Electrical Engineers.—Monday, December 7th. At the Institution, Victoria Embankment, W.C. At 7 p.m. Informal meeting. Discussion on "Design and Performance of Protective Relays," to be opened by Mr. C. L. Lipman.

(Irish Centre, Dublin).—Thursday, December 10th. At Trinity College, Dublin. At 7.45 p.m. Paper on "The Mechanical Winning of Peat," by Mr. J. Lindsay.

(North Midland Centre).—At the Hotel Metropole, King Street, Leeds. At 7 p.m. Paper on "An All-Electric House," by Prof. S. P. Smith.

(Scottish Centre).—Tuesday, December 8th. At the Royal Technical College, Glasgow. At 7.30 p.m. Paper on "Electricity in Mines," by Major E. I. David.

(Dundee Sub-Centre).—Thursday, December 10th. At the University College, Dundee. At 7.30 p.m. Paper, "Some Features of Telegraph Engineering," by Mr. J. K. Murray

(East Midland Sub-Centre).—Tuesday, December 8th. At the College, Loughborough. At 6.45 p.m. Address by Mr. F. J. Moffett, Chairman of the South Midland Centre.

(North-Western Centre, Students' Section).—Tuesday, December 8th. At Milton Hall, Deansgate, Manchester. At 7.30 p.m. Paper on "The Treatment of Overhead Expenses," by Mr. F. C. Lawrence.

(London Students' Section).—Friday, December 11th. At the Institution, Victoria Embankment, W.C. At 6.15 p.m. Paper on "The Rotary Converter Automatic Sub-station," by Mr. F. J. Lane.

Institution of Electrical Engineers—(*continued*).

(South Wales Branch).—Saturday, December 12th. At the South Wales Institute of Engineers, Park Place, Cardiff. At 6 p.m. Paper on "The Selection, Lay-out and Maintenance of Electrical Equipment at Collieries," by Mr. J. A. B. Horsley, Chief Electrical Inspector of Mines.

Glasgow Corporation Electricity Department Engineering Society.—Monday, December 7th. At Welfare Hall, St. Andrew's Cross Works. At 7.45 p.m. Open night. Mains Section.

Royal Society of Arts.—Monday, December 7th. At John Street, Adelphi, W.C. At 8 p.m. Cantor Lecture, "Coal Ash and Clean Coal," by Dr. R. Lessing. (Lecture III.)

Institute of Transport.—Monday, December 7th. At the Institution of Electrical Engineers, Victoria Embankment, W.C. At 5.30 p.m. Paper on "Some Financial and Political Aspects of Highway Development," by Mr. A. Hacking.

Association of Mining Electrical Engineers (London Branch).—Tuesday, December 8th. At the Engineers' Club, Coventry Street, W. At 6.30 p.m. Paper on "Mining in Other Countries," by Mr. H. M. Morgans.

Radio Society of Great Britain.—Wednesday, December 9th. At the Institution of Electrical Engineers, Victoria Embankment, W.C. At 6 p.m. Informal meeting. Talk on "The Acoustics of the Headphone and Loud Speaker," by Mr. A. E. Bawtree.

Institution of Engineers-in-Charge.—Wednesday, December 9th. At St. Bride Institute, Bride Lane, E.C. At 7.30 p.m. Paper on "Oil Fuel for Commercial Purposes," by Mr. J. V. Stevens.
Saturday, December 12th. Social dance.

Junior Institution of Engineers.—Friday, December 11th. At the Royal Society of Arts, John Street, Adelphi, W.C. At 7.30 p.m. Presidential address by Mr. J. S. Highfield.

Physical Society of London.—Friday, December 11th. At the Imperial College of Science, South Kensington, S.W. At 5 p.m. Ordinary scientific meeting.

The "Electrical Review" Service Department.

INQUIRIES must be accompanied by a stamped addressed envelope.

We should be glad to learn the address of a firm known as "LUXTON GREEN," of London, makers of electric soldering plant.

Notes.

Prevention of Accidents.—Arising from the president's address on October 6th, the Board of Control of the National Association of Supervising Electricians has appointed a special committee to go into the question of accidents, their causes and means of prevention, with a view to the publication at a later date of a "Safety Code," which, instead of being an ornamental one, shall be of a practical nature. The Board would be glad to receive details of any accidents, not only fatal and reportable ones, but minor accidents that have occurred in the electrical industry. All information will be treated confidentially, and replies should be addressed to the secretary, Mr. A. Brammer, marked "Accidents."

London Traffic Inquiry.—At the continued inquiry held by a sub-committee of the London Traffic Advisory Council at the hall of the Institution of Civil Engineers on November 26th into the traffic facilities of North London, Mr. F. Pick, assistant manager of the Underground Group, gave further evidence. He stated that, in his opinion, the first step towards relieving the position would be the construction of a tube from Finsbury Park to Golders Green, but that the Underground Group had not the financial resources to construct a tube. He agreed that if protection were given to the Group, it would consider an extension of the tube from Finsbury Park. The inquiry was concluded, and the Committee will submit its recommendations to the Minister of Transport in due course.

Educational Notes.—NORTHAMPTON POLYTECHNIC INSTITUTE.—The annual prize distribution took place on Wednesday evening. The prizes and certificates were presented by Lord Montague of Beaulieu. To-morrow (Saturday) evening the members' and students' conversazione will be held from 6.30 to 10.30 p.m.

SCHOLARSHIPS IN ENGINEERING.—The Governors of Loughborough College invite applications for the award of five open scholarships in the Faculty of Engineering, each of the value of £75 per annum. The scholarships are open to British subjects, over 16 years of age on October 1st, 1926, situate in any part of the Empire, and are tenable at Loughborough College for the period of the full diploma course. The entrance examination for the session 1926-27 will take place on May 27th, 28th, and 29th, 1926. Particulars and application forms may be obtained from the College Registrar, to whom all forms of application must be returned not later than March 1st, 1926.

B.E.S.A. Revised Publication.—A revised edition of the British Engineering Standards Association Publication No. 77, Standard Pressures for New Systems and Installations, has just been issued. The original document was published in 1921, and laid down two standard low pressures, 220 V d.c. and 240 V a.c. At the time an effort was made to standardise one low pressure only for both d.c. and a.c. circuits, but this was not then found to be possible. The Electricity Commissioners, the Institution of Electrical Engineers, and the large industrial and supply organisations have since been consulted, also the local Committees of the B.E.S.A. abroad, and the proposal for one pressure has met with very general approval. The new document lays down 230 V for both d.c. and a.c. as the standard low pressure for new systems. It is hoped that the new standard pressure will be employed in this country for all new systems and installations. Copies of the new specification (No. 77-1925) may be obtained from the B.E.S.A. Publications Department, 28, Victoria Street, London, S.W.1. Price 1s. 2d., post free.

Swansea Electrical Dance.—The annual South Wales Electrical Engineers' dance took place at Swansea, on November 20th, and proved a great success, attracting guests from Swansea district, Cardiff, and other parts of South Wales. The Patti Pavilion was decorated by the Parks and Electricity Departments, the lighting, by means of fairy lamps, mood light, and other devices, being very effective. The music provided by the Manhattans Band was broadcast through the Swansea station.

Glasgow Fire Alarms.—The Glasgow Corporation fire master has been authorised to purchase 20 new telephones to replace those at present rented from the Post Office, and to have each of the fire alarms fitted with a special bridge designed by his staff, the telephones and bridges to cost £200. A special lamp, designed and made by the Inspector of Lighting for lighting the street fire alarms, is to be fitted to all the street alarms.

London's Electricity Supply.—L.C.C. RETURN.—The annual Return relating to electricity supply in the London and Home Counties Electricity District was issued by the London County Council last week. It contains a mass of detailed statistical information regarding the subject, and deals with an area of 1,797 square miles, containing a population of over eight million souls, in which there are 89 authorised distributors. Whereas the issue for 1922-23 comprised 59 pages, that for 1923-24 is increased to 71 pp. It will be reviewed in an early issue.

Electrolytic Tungsten.—In *Zeitsch. für Elektrochemie*, No. 31, 1925, Van der Liempt describes the results of some researches made by him in the electrolysis of, and plating with, tungsten. Tungsten metal is obtained in the form of powder electrolytically by means of an electrolyte consisting of sodium or other alkali tungstate in a fused condition, using as anode either graphite, tungsten metal, or tungsten carbide. As cathode, either a second element of similar composition to the anode may be used or, if the bath container is of metal, this may be made to serve. The material recommended for the bath material may be one of the following: calorised iron, iron-chromium or nickel-chromium alloy, or quartz or other fire-resisting material. The most favourable temperature of the fused electrolyte appears to be from 700 to 1,000 deg. C.; and the current density about 15 amperes per square decimetre. The product, consisting of tungsten metal, is about 99.3 per cent. pure, the impurities consisting of silicon and reduced alkali metal. The electrolyte should be either neutral or very faintly acid.

For plating with tungsten a porcelain bath container is recommended, with a tungsten plate as anode, and a copper plate, or the article that it is desired to plate as cathode. In this case the electrolyte may be weakly acid, which results by mixing 38 per cent. Na_2WO_4, 32 per cent. Li_2W_4, and 30 per cent. of WO_3. The optimum current density lies between 20 and 80 amperes per square decimetre, and the most suitable temperature is round 1,020 deg. C. Copper and nickel are both very suitable cathode materials, and if it is desired to plate objects made of another metal, a preliminary plating either with copper or nickel is recommended. To obtain a thick coating of tungsten the operation must be prolonged, or repeated until the desired thickness is reached.

It is believed that this discovery, often unsuccessfully sought for, is of great technical importance. It would, of course, be much less expensive to accomplish if it were possible to deposit tungsten from a water or acidified water solution of a salt of tungsten. Experiments in that direction have been conducted with various tungsten salts, including the chloride, the double oxalate and cyanide; and various solvents, including acetone and glycerine, without success. A small deposit of tungsten was obtained in the glycerine bath containing tungsten chloride, but although conductivity was increased by the introduction of dry hydrochloric acid gas into the bath, no results of a practical character were obtained. In the present state of knowledge therefore, the only method of plating with tungsten is from a molten electrolyte, such as has already been described.

The "Panatrope."—The "panatrope," a new musical reproducing instrument which operates on a light wave system, synchronising electrical reproduction with electrical recording of sound, had its premier presentation on November 11th at the Æolian Hall. The instrument has been developed by the Radio Corporation of America, the General Electric Co., the Westinghouse Electric & Manufacturing Co., and the Brunswick-Balke-Collender Co.—*Reuter's Trade Service* (New York).

Coal, Power, and By-products.—Under this title a paper was read by Mr. T. R. Wollaston, M.I.Mech.E., before the Manchester and District Association of the Institution of Civil Engineers last week. The author proclaimed himself as unorthodox, advocating a deep and hot fuel bed in a boiler furnace, with the correct proportions of primary and secondary air to produce perfect combustion, and claiming that gas, oil, or coal could be burnt with from 5 to 10 per cent. excess air and a CO_2 content of 18 per cent. He urged that a radical change in boiler design was necessary, and put forward some designs of his own for firing boilers with producer gas.

Wave Power in Australia.—Following the recent demonstration by Mr. Percy Bates of his invention for the utilisation of wave-energy on the shore—the motion being transmitted to hydraulic pumps and then transferred to a water-turbine coupled to an electric generator—a number of city business men have decided to take steps for the formation of a company, to be known as Bates Wave Power (Australia), Ltd., with a capital of £100,000.—*Daily Telegraph* (Sydney).

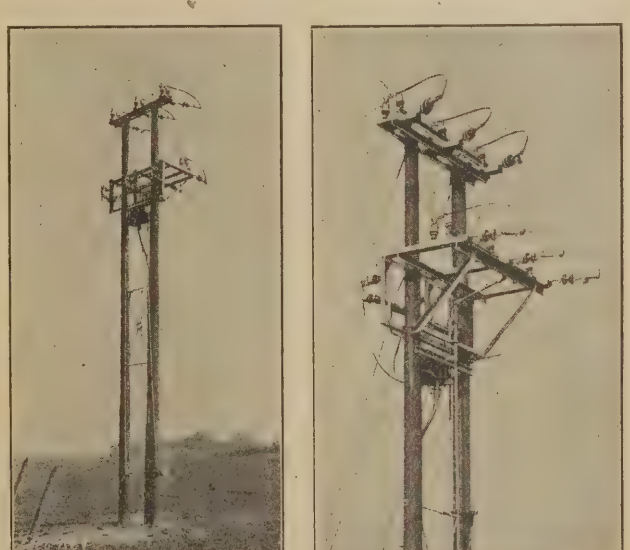
A Large Lighting Installation.—The accompanying illustration is of the chapel of the famous Roedean School, Brighton, which has recently been equipped with electric lighting. The installation, comprising about 1,800 lights, has been completely wired on the "Kaleeco" system, and it is said that the work was entirely completed in seven weeks, from the date of order to the date of completion, without previous notice. The work was carried out entirely by Messrs. V. G. Middleton & Co.,

Church Lighting at Brighton.

Ltd., the consulting engineers being Messrs. Couzens and Brown. The supply is taken from the Brighton Corporation system at 8,000 V, 3-phase, 50 periods, and is transformed on site to 230 V for distribution to the various buildings. A previous record installation carried out by the same contractors was Marlborough College, where some 2,000 lights were also wired on the same system.

Finsbury Technical College. — STREATFEILD MEMORIAL LECTURE.—The eighth annual lecture was to be delivered by Mr. F. H. Carr, C.B.E., F.I.C., at the College yesterday, the subject being "The Scientific Basis of Industry." Sir William J. Pope, K.B.E., F.R.S., was to preside, and constructive proposals were to be put forward for the foundation of a monotechnic in London to be devoted to the training of chemical engineers, utilising for the purpose the buildings of Finsbury Technical College.

Characteristics and Uses of Ground Gears.—In a paper presented before the Institution of Mechanical Engineers, Mr. H. F. L. Orcutt set forth the peculiar features of the ground gear and made suggestions for its use in engineering work for which it may be specially adapted. He said the two outstanding characteristics of ground gears were extreme accuracy and the possibility of making a straight-tooth spur-gear of material with any desirable physical properties. The gear grinding machine was the only instrument which would produce straight-tooth gears to run quietly at high speeds. Moreover, gears with the teeth finished by grinding had special characteristics of great importance to the mechanical engineer. These characteristics were of such a nature that they made possible new developments in power transmission. Any number of gears in motor-car gear-boxes were in use carrying a load of over 3,000 lb. per in. of face. As a contrast, many electric railway gears were in use carrying loads of only 1,200 lb. per in. From tests it seemed that quiet running could be secured with high-grade gearing at practically unlimited speeds if the teeth were accurately ground, not overloaded, and the gears correctly mounted. A peripheral speed of 3,000 feet per minute was commonly in operation with quiet running, and it was reported that there were in use ground gears transmitting considerable power at a peripheral speed of no less than 10,000 and even 20,000 ft. per min. Direct comparative tests had been made which demonstrated that gears accurately and smoothly finished had a longer life than those which were inaccurately or roughly finished; and actual service tests had shown that railway transmission gears with ground teeth outlasted all others. An important application of ground gears was beginning to interest electrical engineers. The ground gear had many features which made it especially applicable as a direct reduction unit between the motor and axle of electric locomotives. It was simple, smooth running, quiet, would stand very high speeds, could be of small dimensions, had a high factor of safety and long life. So far as it had been applied it had demonstrated its safety and life and smooth running. It had not, however, been made use of with dimensions and speeds outside those specified usually for soft steel. So far as was known, the ground gear was not used by any electrical engineer in ordinary engineering speed reductions, so commonly demanded where a direct motor drive was employed. There was a very large possible application in this particular direction. The ground gear for motor drives would certainly replace in many instances helical gears, laminated gears, fibre gears and chain drives, in many cases saving in first cost as well as giving an equally quiet and a more lasting service. Whether ground gears would be used for turbine transmission very extensively or not it was impossible to say. They had been in service for some time, but only to a limited extent. Gear grinding on large diameters with fine pitches had not been very much developed. It was no exaggeration to state that gear tooth grinding opened a new era of practical progress in power transmission.



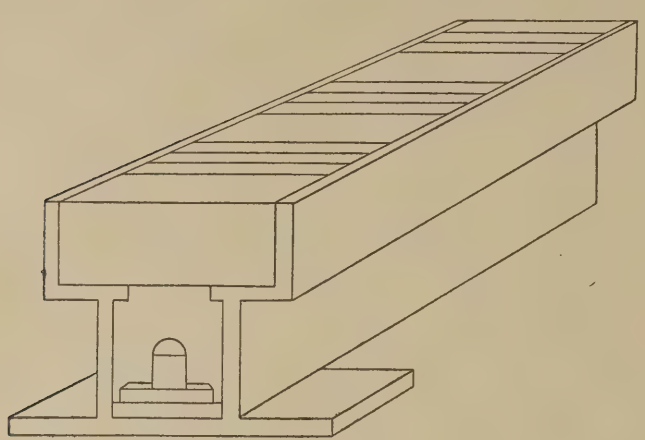
The Betrayal of the Megohm.

I am the mighty megohm, guarding close
The confines of high voltage, and I keep
Within these insulating bonds the path
Of surging current for the use of man.
From the lean busbar leops the potent force
Ready to serve or break him, and my task
Ever the sleepless watch upon the mains.
Day, night, from dawn to sunset and beyond
Through each full cycle moves the restless power,
Nor stops nor weakens but to leap more strong.
From the peak load's fury and the dire strain
Of overload, deliver me!—That hour
When every molecule is stressed to stand
The fell transformer's pressure, when the song
Of every spinning turbo gathers sound
More menacing and strident down the line.
I see the switchboard in the house of power,
I watch the 'meter's hand across the dial,
I feel the shock of every new machine
Switched in to meet the load. And then I call
On every molecule to stand and hold?
And if some fail me—the dread leakage path,
The guileful current seeping through those pores
To mine undoing. . . .
Then alas, betrayed,
Impotent, broken from these treacherous wounds
I fail, and dwindle and am nought. Now comes
The Megger whom erstwhile I had defied,
To mark my failure and record my shame!

—A. G. H. DENT.

Austrian Electrical Congress.—The 22nd annual meeting of the Union of Austrian Electricity Supply Undertakings was recently held in Gratz, when among the papers read was one on "Safety Precautions in High-Pressure Electrical Installations," by Herr F. Hartmann, and one on "The Value of Lighting Technics for Central Stations," by Prof. J. Ondracek.

Poletype Switches.—A feature of an electric tranmission line, for which the contractors were Messrs. W. T. Henley's Telegraph Works Co., Ltd., is indicated in the two accompanying illustrations, which show an "H" terminal pole that has been equipped with three 11,000-volt, triple-pole, air-break, horn-type isolating switches manufactured by Messrs. Electric Control, Ltd., of Glasgow. The two horizontally-mounted switches are for isolating the two separate supplies, which are received at the terminal pole from two separate power stations. The vertically-mounted switch is for isolating the tap-off,



Pole-mounted Isolating Switches.

which leads through a pole-type tri-box to an underground cable supplying a colliery. Seeing that the two power lines approach the terminal pole with an angle between them of approximately 60 deg., the compact result obtained by the combination of horizontal- and vertically-mounted switches is particularly interesting. As will be seen from the illustrations, all three isolating switches are operated from the ground level by means of quadrants and levers, and padlocks are provided for locking the switches either in the "closed" or "open" position.

A Road Surface Traffic Guide.—To provide an efficient means of guidance for traffic round dangerous corners, Mr. R. F. Brown, surveyor, Great Clacton, has invented an ingenious device known as the "Illuminated White Line." It consists of a wrought-iron "square" channel trough, with a flanged top in which are fitted alternately laminated white marble, reinforced, and prism-glass pieces, giving the effect of a permanent white line. In the trough under the "white line" elements is arranged a system of electrical illumination produced by the Electrical Installation Co., London. The apparatus is manufactured in sections of convenient lengths and is about 3½ in. in width and 5 in. deep. It is intended to be suitably installed where required in the roadway with its top (marble and glass) surface level with that of the road. It will resist, it is claimed, heavy road traffic, by virtue of the lamination and reinforcement of the marble, and special lenses which, it is said, result in a powerful beam of light.

The first installation using this device was recently completed and tested, with satisfactory results, at the very important cross roads on the North Central Road and Golders Green Road, Hendon. It is said that the "white line" when illuminated at night is visible to a vehicle driver very many yards before he reaches it. The electrical installation at Hendon is automatically controlled for switching on and off and for lighting-up time variations. The device is manufactured by Messrs. Haywards, Ltd., London.

"White Line" Device.

Appointments Vacant.—Clerk and solicitor (£1,500) for the London and Home Counties Joint Electricity Authority. Assistant Engineer for the East Grinstead U.D.C. Electricity Department. Assistant in the Mains Department of the Southport Corporation Electricity Works. Charge Engineer for the Stalybridge, Hyde, &c., Joint Board. Shift Charge Engineer for the United Alkali Co., Ltd.; Commercial Assistant (£500) for the Croydon Corporation Electricity Department. (See our advertisement pages to-day.)

Telephotography.—The claim that it is possible to broadcast pictures in the same way as music is broadcast was put forward by Mr. Thorne Baker during a recent lecture before the Royal Photographic Society. In the demonstration the resulting picture was similar to those which appear in newspapers, and the time taken for the transmission was three and a half minutes.

Mr. Thorne Baker is reported to have said that the receiving instrument which he had designed could be operated by any intelligent boy or girl and could be used by anyone possessing a valve receiving set. The cost of the sensitised paper for each picture should not exceed a penny, and by the method which he had demonstrated it would be possible to broadcast pictures of people or of events.

High-Voltage Cathode Rays.—In a preliminary communication to *Science* of November 13th, Dr. W. D. Coolidge mentions that Lenard succeeded in getting electrons from a cathode-ray tube out through a thin metal window into the air; the voltage employed was that necessary to produce a 3-cm. spark between small spheres. The window consisted of a piece of aluminium foil 0.00265 mm. thick and 1.7 mm. in diameter. With a specially-designed hot-cathode, high-vacuum tube, it has been found possible to operate with as much as 200,000 volts and several milliamperes, using a window 8 cm. in diameter. The maximum range of the electrons in the air in front of the window has been measured approximately; for an aluminium window 0.0254 mm. thick, it is given by the equation: Range (cm.) = 0.254 × kilovolts (max.) − 17.8. The lowest peak voltage at which there is appreciable intensity in front of and close to the window is 70 kilovolts, and the maximum range at the highest voltage used, 250 kilovolts, is 46 cm. The luminosity of the air in the path of the discharge is very beautiful, especially at the higher voltages, where, due to scattering, the beam is seen to spread out and bend round until it finally extends more than half as far back of the window as it does in front of it. The appearance is then that of a solid ball of purple glow with its centre a little in front of the window.

Calcite crystals, upon being rayed, fluoresce strongly in the orange and remain highly luminous for several hours after raying. In addition to this, they may show bright bluish white scintillations. These have been observed while the crystal is undergoing bombardment and for as long as a minute after raying. By slightly scratching the rayed surface of the crystal with any sharp instrument, the scintillations may be produced for as long as an hour after raying. Many liquids and solids undergo marked chemical changes under the influence of the high-speed electrons. For example, castor oil changes rapidly to a solid material. Crystals of cane sugar turn white in colour and, upon subsequent gentle heating, evolve considerable quantities of gas. An aqueous solution of cane sugar becomes acid to litmus upon being rayed.

The effect on organised tissues is very pronounced, as may be seen from the following examples. When a portion of the leaf of the rubber plant (*Ficus Elastica*) is rayed with 1 milliampere for as long as 20 seconds, the rayed area becomes immediately covered with white latex, as though the cell walls had, in some way, been ruptured. An exposure of as little as 0.1 milliampere for 1 second produces a visible colour change with subsequent drying out of the rayed area to a depth corresponding to the penetration of the rays. The ear of a rabbit was rayed over a circular area 1 cm. in diameter with 0.1 milliampere of current for 0.1 second. Within a few days the rayed skin became deeply pigmented and the hair came out. Seven weeks after the treatment new hair appeared.

Fruit flies, upon being rayed for a small fraction of a second with 1 milliampere, instantly showed almost complete collapse, and in a few hours were dead. Bacteria have been rayed and an exposure of 1/10 second has been found sufficient to kill even the highly-resistant spores of *b. subtilis*. The phenomena of luminescence, phosphorescence, thermo-luminescence, and change of colour which take place as a result of electron bombardment from the tube are very striking and easily demonstrated, and many substances which could not be brought into a vacuum can be subjected to electron bombardment in this way.

Recent Progress in Illuminating Engineering.—The opening meeting of the Illuminating Engineering Society on November 26th, presided over by Mr. J. Eck, was as usual devoted to the presentation of reports on progress and to the exhibition of novelties. Before proceeding with the business, the chairman moved a resolution expressing sympathy with His Majesty King George and the Royal Family in the bereavement they had sustained in the death of the late Queen Alexandra; and referring to her interest in light and health, as exemplified by her encouragement of the introduction of special lamps for medical treatment from Denmark. A very interesting and comprehensive set of novelties were shown, the first item being the "Dia" long-burning flame arc, shown by Captain Risch. One of these was hung from the dome of the lecture hall, forming the sole means of lighting the room during the first part of the proceedings. The special design of the globe obviates the tendency for fumes to deposit and obscure the light. The lamp is stated to operate at 0.18-0.22 W per candle and to have a burning period with one pair of carbons, of 120 hours. Mr. Groom demonstrated the ingenious Mutochrome projector, whereby, with the aid of a number of lenses equipped with colour-filters, a series of dovetailed patterns and colour effects can be thrown on the screen. One obvious application of the apparatus is in the design of wallpapers, &c. Mr. A. Cunnington illustrated by a lantern slide a new illuminated name-plate erected outside Putney railway station, which is seen by the passengers before the train enters the station. A new cubicle integrating photometer was sent by Col. Kenelm Edgcumbe, and Mr. Sack showed a form of motor-headlight in which partially colour-sprayed lamps are used. This appears to be a simple and effective means of mitigating the glare difficulty. Other exhibits included various new forms of reflectors and lighting units. Mr. J. Horstman gave a demonstration of a series of automatic time switches.

After some discussion of the exhibits, Mr. Gaster presented, in abstract, his report on "Recent Progress in Illuminating Engineering." This served to show how rapidly the activities of the Illuminating Engineering Society are growing. Mr. Gaster made special reference to the work of the Committee on Illumination working under the Department of Scientific and Industrial Research, which is doing good work in regard to methods of lighting for various difficult factory processes. The concluding section of the report dealt with developments abroad, and it was shown how striking was the growth of the illuminating engineering movement in the chief Continental countries. The moral is the need for a strongly-supported illuminating engineering society in this country to express the national views in lighting matters, and the desirability of this country continuing to take a leading part in these international gatherings. The next meeting is to be held at the premises of the E.L.M.A. Lighting Service Bureau, when the report of the Committee on Progress in Electric Lamps and Lighting Appliances will be presented.

B.E.S.A. Specification.—At the request of the Radio Society of Great Britain and the Ebonite Manufacturers' Association, a Standard Specification for ebonite suitable for panels for radio reception purposes, has been drawn up by the British Engineering Standards Association. It is anticipated that this will go a long way towards eliminating the doubtful qualities of ebonite from the market. The composition of the standard ebonite is rigidly specified, and adequate mechanical and electrical tests are laid down. A recommended list of sizes and

thicknesses of panels is included, and while it is realised that the size and shape of panels will necessarily vary in accordance with variations in the progress of design of receivers, every endeavour has been made to cover all reasonable requirements suggested by the trend of present-day design. By making use of the recommended sizes as far as possible, the full benefits of standardisation will accrue to purchaser and manufacturer alike. Copies of this specification (No. 234, 1925) may be obtained from the B.E.S.A., Publications Department, 28, Victoria Street, London, S.W.1, price 1s. 2d. post free.

A Lifeboat's Wireless Equipment.—The forty-foot lifeboat in which Captain G. E. Hitchens and four companions are to sail round the world has left London. The object of the 38,000-mile voyage is to demonstrate in a practical way how a lifeboat can be fitted for a long cruise, without involving the crew in serious hardships, and to test the value of wireless equipment to a crew in such circumstances. The *Elizabeth and Blanche* has, therefore, been fitted with the latest type of Marconi lifeboat set, which will be subject to exacting tests under actual service conditions. The Marconi ¼-kW lifeboat set has received the full formal approval of the Board of Trade and the Post Office, and consists of a quenched-gap transmitter and a valve receiver, the latter being arranged for directional reception (though this is in excess of the actual Board of Trade requirements, and the standard non-directional receiver is supplied if required).

Radio Apparatus on the "Elizabeth and Blanche."

The power for the transmitter is supplied by a small petrol plant, and in actual tests with this apparatus installed in a lifeboat, signals have been received by ships at distances up to 175 miles, and were reported to be steady and clear; and communication was maintained for one hour in daylight with a land station 300 miles away. The directional receiver will be a valuable aid to navigation, and the power plant for the transmitter will also be used to work a small searchlight which can be controlled by a Morse key, so that it can be employed for flashing signals if necessary; and also to provide illumination for the wireless compartment and the boat. In addition, the *Elizabeth and Blanche* will carry a Marconi marine receiver of the 4b type, which employs two valves, is adaptable to every wave-length used for commercial purposes, and will therefore enable the crew to receive messages of meteorological and navigational importance, time signals, &c., over long distances. The vessel is provided with a standard Parsons 2-cylinder, 14-16-h.p. petrol-paraffin engine for propulsion.

Institution Notes.

Institution of Electrical Engineers.—SOUTH-MIDLAND CENTRE.—In consequence of the lamented death of Her Late Majesty Queen Alexandra, the annual dinner of the Centre, which was to have taken place on November 27th, has been postponed until Wednesday, January 13th, 1926.

INFORMAL MEETING.—At the informal meeting on Monday, November 23rd, with Mr. J. Coxon in the chair, Mr. E. E. Tasker opened a discussion on "The Testing of Large Electric Plant," but the title of his paper did not convey the importance of the method which he described. The system of testing is one developed in Sweden and is mainly an elaboration of the Hopkinson test, but obviates the need of two identical machines. Mr. Tasker showed that a considerable number of difficulties were always entailed in arranging a full-load test of machines corresponding to the normal service conditions, especially when testing large sets. The no-load and short-circuit heating test was used to a large extent but did not give exact results, as the method was founded on the combination of two separate tests which both showed a deviation from the actual conditions. Synchronous machines could be tested as over-excited synchronous motors; the losses in the armature could be adjusted to correspond to the right values, but the method had a great disadvantage in that the field winding was loaded to a greater extent than under normal conditions. A method had been invented by Mr. Liljenroths for testing synchronous machines, on the following lines:—Let them suppose that any machine was electrically connected to a system without being mechanically connected to any other machine, either as a driving motor or as a load-carrying generator, and that this machine was run at no load at normal speed. If the conditions of the system were altered so that the speed of the machine was increased, the machine would continue to run at no load. While this increase of the motor speed was taking place and the machine thus being accelerated, a surplus of electrical energy had to be supplied to the rotating parts of the machine in order to obtain the necessary kinetic energy, *i.e.*, the machine would during this time work as a motor, the load being the rotating masses of the machine itself. If the alterations occurred comparatively quickly, the machine could easily be fully loaded. If, on the contrary, the alteration of the system was made so as to decrease the speed, the rotating masses of the machine would have to return the energy to the system and the machine would during this period work as a generator on the system. It was quite evident that if such alterations were made to take place successively and were of short duration, the machine would work alternatively as a motor and generator, with the result that—although not mechanically loaded in any way—it would be on the average fully loaded. Mr. Tasker then described the practice of using a generator of, say, 55 cycles, or 5 cycles more than the frequency of the machine under test, and of about 15 per cent. of the output. The current of this machine superimposed and interrupted on the current to the other, produced all the conditions of load. He explained the practice of applying the test to d.c. machines, and asynchronous and synchronous motors. Numerous diagrams and test sheets as well as lantern slides of machines were exhibited.

Institution of Engineering Inspection.—On January 15th, 1926, a paper will be read by Messrs. B. P. Dudding, A.R.C.Sc., F.Inst.P., and G. T. Winch (of the Research Laboratories of the General Electric Co., Ltd., on "The Characteristics of Electric Lamps in Relation to their Testing.

Royal Society.—NEW OFFICERS.—At the meeting on Monday last Sir Charles Sherrington retired from the office of president, which he has held for five years, and was succeeded by Sir Ernest Rutherford, O.M., who is at present visiting his parents in New Zealand. The following officers were elected: Treasurer, Sir David Prain; Secretaries, Mr. J. H. Jeans and Dr. H. H. Dale; and Foreign Secretary, Sir Richard T. Glazebrook. The Copley medal was awarded to Prof. Einstein in recognition of his brilliant work in developing his theory of relativity, which, itself under test a few years ago, is now fully accepted and is used as a test for the validity of other theories. The Sylvester medal was awarded to Prof. A. N. Whitehead, and the Hughes medal to Mr. F. E. Smith.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.)

Mr. R. B. MITCHELL, the Glasgow city electrical engineer, has been invited, as president of the I.M.E.A., to attend a conference of the International Electrotechnical Commission in New York next April, and the Electricity Committee recommends that this visit be authorised by the City Council and that Mr. Mitchell's expenses be defrayed.

Mr. A. J. HENNING, of H.M. Dockyard, Portsmouth, has been appointed assistant engineer in the Portsmouth Corporation electricity supply mains department.

Mr. W. THYNE, chief clerk of the telephone service in Sheffield, who is returning to Glasgow to take charge of the office where he began his career, has been presented with a musical cabinet by the telephone staff. He has been in Sheffield for 27 years.

Mr. C. G. RANSLEY, for many years district manager of the Guildford District of the Post Office Telephones, retires on December 19th, after completing 45 years in the telephone service. He will be succeeded by Mr. R. U. TUCKER, of Birmingham.

Messrs. Premier Electric Heaters, Ltd., of Birmingham, have appointed Mr. JAMES C. STEWART, of Glasgow, as their representative for the Glasgow and Edinburgh districts.

Councillor J. HEWITT, J.P., has been elected chairman of the St. Helens Electrical Supply Committee, and Col. NORMAN PILKINGTON, D.S.O., deputy-chairman.

At the works of the Liverpool Electric Cable Co., Ltd., Bootle, Liverpool, on November 9th, Mr. WILFRID S. TAYLOR, who has resigned his position as managing director of the company, was presented by the employés with an oak writing desk and chair. Mr. T. H. Tweedle, works manager, who made the presentation, referred to the good feelings which had always existed between Mr. Taylor and the employés.

Mr. A. DUPONT, managing director of the Compagnie Française des Câbles Télégraphiques, of Paris and London, since 1916, has been elected president to folow the late Mr. E. May.

Mr. PHILIP DEBELL TUCKETT has been appointed a director of the Chelsea Electricity Supply Co., Ltd., in the place of the late Major W. F. Woods. Mr. Tuckett is chairman of Edmundsons' Electricity Corporation, Ltd., and a director of the City of London Electric Lighting Co., Ltd. He is also a representative on the London Joint Electricity Authority.

Mr. J. H. ASDELL, M.Sc., has been appointed manager of the Electrical Department of Messrs. Parker, Winder and Achurch, Ltd. Mr. A. A. Merris will continue duties as outside manager.

Obituary.—MR. J. F. JOHNSON.—Mr. Josiah Francis Johnson, manager, General Engineering Division of the South Philadelphia Works of the Westinghouse Electric and Manufacturing Company, died suddenly of cerebral hemorrhage on November 12th. Mr. Johnson, who was 46 years of age, entered the service of the company in 1905, when he was engaged in the shop testing of steam turbines. Passing through other positions, he subsequently became engineer of the Turbine Department, which position he held until 1923, when he took up the duties which he was fulfilling at the time of his death.

MR. G. Y. ALLEN.—Mr. George Young Allen, who was killed in a railroad accident in America on November 12th, was technical assistant to the manager of the Radio Department of the Westinghouse Electric and Manufacturing Company, and he had been directly concerned with many of the technical developments and commercial applications of radio, particularly carrier current. He was born in 1893. He was engaged in research work for the Western Electric Co., after graduation, and at the outbreak of the war was made "radio aide" to the U.S. Navy Engineering Bureau. He entered the Radio Department of the Westinghouse Company in 1919. Mr. Allen was a member of the Institute of Radio Engineers, the American Institute of Electrical Engineers, the National Electric Light Association, and the Associated Manufacturers of Electrical Supplies. When he met his death, he was returning from the fourth annual Radio Conference called at Washington by Secretary Hoover, where he represented the radio manufacturing industry in the design of the technical features of the new radio law to be presented for congressional action by Secretary Hoover.

M. A. CHARLIAT.—The death is reported from Paris of M. Alexandre Charliat, founder and director of the Paris Ecole d'Electricité Industrielle.

MR. R. O. BLACKALL.—It is with feelings of deep regret that we have to record the early death of another X-ray pioneer. Mr. Reginald O. Blackall, who began his work in this direction at the London Hospital, which he joined in the year 1902, was a sufferer from X-ray dermatitis for many years. He continued his duty notwithstanding that his fellow workers were sorely stricken, Mr. E. Harnock losing both arms and Mr. E. Wilson his life. Subsequently Mr. Blackall lost both his hands, but only after he had the satisfaction of knowing that later workers would not need to be subject to the same dangers as had stolen unawares upon himself and others. In 1920 he had to retire and he was given a Carnegie Hero Fund award and grant and a pension from the London Hospital. Mr. Blackall was only 44 years of age.

DR. H. W. NICHOLS.—Dr. Harold W. Nichols, who died recently at Maplewood, New Jersey, U.S.A., was connected with the Bell Telephone Laboratories. He took a prominent part in the transatlantic radio-telephone tests in 1923 and was awarded the Fahie Premium of the Institution of Electrical Engineers for a lecture upon this subject.

MR. E. D. M. SCRIVENER.—We regret to announce that Mr. E. D. M. Scrivener, joint managing director of Messrs. Taylor, Tunnicliff & Co., Ltd., died on November 29th at St. Bartholomew's Hospital, London, after a short illness.

New Companies Registered.

Banting & Tresilian, Ltd. (209,862).—Private company. Registered November 23rd. Capital, £1,000 in £1 shares. Objects: To carry on business as mechanical and electrical engineers, manufacturers of and dealers in articles required for or used in connection with general, electrical and civil engineering, &c. The permanent directors are:—P. E. Banting, Warren Garth, The Drive, Belmont, engineer (chairman); A. E. Tresilian, Norvic, Salisbury Avenue, Cheam, engineer (both directors of P. E. Banting (Tubes), Ltd.). Qualification, 1 share. Remuneration as fixed by the company. Registered office: 64, Victoria Street, S.W.1.

Harry Morser & Co. (Wireless), Ltd. (209,943).—Private company. Registered November 26th. Capital, £1,500 in £1 shares. Objects: To acquire the business of a manufacturer of and dealer in a specially-designed headphone and of wholesale wireless equipment and appliances carried on by H. Morser, at 94, Hatton Garden, E.C. The directors are:—H. Morser (chairman and managing director), 69, Church Road, Richmond, Surrey; H. W. D. Gallwey, Winchester House, Kingston Hill, Surrey; H. E. F. Connolly, 10, Nutley Lane, Reigate, Surrey. Qualification, 10 shares. Secretary: H. E. F. Connolly. Solicitors: Agar, Hutton & Co., 21, Wigmore Street, W.1. Registered office: 94, Hatton Garden, E.C.

Power and Lighting Cables, Ltd. (209,977).—Registered as a private company on November 27th, with a nominal capital of £10,000 in £1 shares. The objects are to acquire the business of manufacturers of and dealers in cables (submarine and otherwise), telegraphs, telephones, and electrical plant, wire drawers, rubber manufacturers, &c. The subscribers (each with one share) are:—A. Blackwood, 74, Twyford Avenue, Acton, W.3, electrical engineer; W. F. B. Bartram, 36, Holland Park, W., electrical engineer. The first directors are to be appointed by the subscribers. Solicitors: Warren and Warren, 14, Bedford Row, W.C.1. Registered office: 42-3, Craven House, 121, Kingsway, W.C.2.

Official Returns of Electrical Companies.

Shipshape, Ltd.—D. W. Henley, of 73, Basinghall Street, E.C.2, incorporated accountant, was appointed receiver and manager on November 20th, under powers contained in debentures dated November 12th, 1925.

Humavox, Ltd.—E. P. Warner, A.C.A., of 75, New Street, Birmingham, was appointed receiver and manager on November 14th, under powers contained in first mortgage debenture dated November 6th, 1925.

Cross & Cross, Ltd.—Debenture charged on the company's undertaking and property, present and future, including uncalled capital, dated November 9th, 1925, to secure all moneys due or to become due from the company to Barclay's Bank, Ltd.

Midland Radiotelephone Manufacturers, Ltd.—Debenture dated November 4th, 1925, to secure £4,000 charged on the company's undertaking and property, present and future. Holder: C. Furber, Amblecote House, Brierley Hill, Staffs.

Greenwich Cable Works, Ltd. — Satisfaction in full on October 27th, 1925, of mortgage dated October 8th, 1921, securing £3,000.

Rangoon Electric Tramway and Supply Co., Ltd.—Satisfaction to the extent of £8,314 on May 8th, and to the extent of £1,166 on May 20th, 1925, of debenture stock dated February 1st, 1906, to January 15th, 1924, securing £250,000. (Notice filed November 18th.)

Sloan Electrical Co., Ltd. (61,528).—Capital, £60,000 in 10,000 preference and 50,000 ordinary shares of £1 each. Return dated July 22nd, 1925. 5,000 preference and 40,000 ordinary shares taken up. £38,500 paid. £6,500 considered as paid. Mortgages and charges, nil.

Birmingham District Power and Traction Co., Ltd. (19,077).—Capital, £700,000 in 250,000 preference and 450,000 ordinary shares of £1 each. Return dated June 2nd (filed September 15th), 1925. 146,846 preference and 412,934 ordinary shares taken up. £559,780 paid. Mortgages and charges, £300,308 4½ per cent. first debenture stock.

Sheffield Electric Power Co., Ltd. (106,880).—Capital, £2,000 in £1 shares. Return dated December 31st, 1924 (filed August 1st, 1925). Two shares taken up. £2 paid. Mortgages and shares, nil.

T. M. Johns & Co., Ltd.—Particulars filed of £1,500 debentures authorised November 10th, 1925, charged on the company's undertaking and property, present and future, including uncalled capital, the whole amount being now issued.

Standard Telephones and Cables, Ltd. (formerly the Western Electric Co., Ltd.) (106,921).—Capital, £1,000,000 in £1 shares. Return dated May 19th, 1925. All shares taken up. £656,000 paid. £344,000 considered as paid. Mortgages and charges, nil.

Shanghai Electric Construction Co., Ltd. (86,795).—Capital, £500,000 in £1 shares. Return dated June 17th, 1925. 499,609 shares taken up. £416,609 paid. £83,000 considered as paid. Mortgages and charges, nil. Return of allotments made up to July 29th, 1925, shows a further 391 shares allotted for cash.

Eagle Electric Light and Power Co., Ltd.—Satisfaction in full on July 18th, 1925, of debentures dated July 18th, 1922, securing £750. (Notice filed November 17th, 1925.)

Bucks. Electric Wire and Engineering Co., Ltd.—Mortgage dated November 5th, 1925, to secure £1,000 charged on certain land and premises in Stantonbury, Bradwell, Bucks. Holders: Mrs. H. Kibble and A. J. Kibble, 23, Thompson Street, New Bradwell, Bucks.

City Notes.

Reports and Meetings of Electrical Companies, Dividend Results, &c.

India Rubber, Gutta Percha, and Telegraph Works Co., Ltd.

Presiding at the meeting of this company on Friday last, Mr. C. H. Gray said that the gross profit amounted to £330,695, an increase of £10,287 over the preceding year. The sales showed an increase of about 10 per cent. over last year which, considering the general state of trade during the past twelve months, was very satisfactory. The sales of the French factory also showed a satisfactory increase; the result of its trading for the year being considerably better than that of 1924. The net profit was £108,481, from which £60,000 had been transferred to the reserve fund. The fact that the French Exchange had further depreciated from 82.17½ fr. to 103.52½ fr., was a factor to be taken into account in relation to their assets in France. Sooner or later this aspect of the balance sheet would have to be dealt with and when there was evidence of stability in the franc, the subject would have their careful consideration. In the course of his review of the accounts the speaker said that the stock values amounted to £355,953, or £30,221 more than last year's figures, due to an increase of stock in certain special directions. With reference to the present year they had had detailed reports from all sections of the company's business, which included buying, manufacturing, costing and selling. The number of employés was about 5,000, and the distinct progress made, as compared with last year, showed that there had been good team work. Some sections had been profitable, in others the loss was noticeably less than last year, and there was only one case where apparently there was no improvement, and that was at the works at Burton. They believed that that was a passing phase. The combined sales from Silvertown and Burton showed an increase over last year of 9 per cent. in cash value, and in view of the fact that during this year slightly lower selling prices prevailed in most cases, they calculated that the volume of the business had increased by about 12 per cent. Their foreign branches showed an improvement in their accounts, having, as a whole, made a profit on their sales. The submarine department had been increasingly busy during the year; their cable ship, the *Silvergray*, had had a considerable amount of

repair work to do, and in addition had successfully carried out the laying of a new cable for the French Government between Marseilles and Tunis. In referring to the Buying Department, the chairman alluded to the lower price of coal, and the cotton market, and he added that as far as rubber was concerned, during the year under review they bought fairly well, which partially accounted for the profit made. As to the future there appeared to be a belief that the demand was overtaking the supply. However that might be, this question of the purchase of rubber was one which had the close attention of the directors, and would require to be treated with the utmost care. With reference to their Persan Works, the result of the past year's trading was a small loss but was distinctly better than was the position during the previous year. Trading in France at the present moment was extremely difficult owing to the fluctuations in the exchange affecting the value of the franc. It would be a great boon to traders generally if that value could be stabilised, by the French Government's putting its financial house in order, which, they were told, could only take place when the French people consented to be taxed higher than they were at present, and pay their debts. The Palmer Tyre section of the business was more satisfactory than it had been for some years. The selling expenses showed a much lower ratio to the turnover than hitherto, and would, they anticipated, be still lower in the course of the current year. With reference to the labour employed at Silvertown, they were in the same position now as at the end of last year, the same basis of rates of pay being in force. No friction of any sort had arisen with the workers during the year; the isolated cases for inquiry brought forward by them, had been settled speedily and amicably. With the varied nature of their work it was very difficult to compare one year with another as regarded the output per worker, but they thought that on the whole there was a slight improvement in that respect. Their activities during the year generally had resulted in a considerably better trading year than the last, which went some way to justify the optimism of Major Darwin, who at the darkest period of the company's fortunes, pinned his faith to their ultimate success. But they had to remember the old adage that "one swallow does not make a summer," and that they had difficulties before them both internally and externally, which they would have to deal with as best they could. Col. Jarvis seconded the motion. Replying to a short discussion the chairman said the board would be delighted to declare an interim dividend when it saw clearly its way to do so. It was impossible to say what limitation was to be placed on the reserve fund, because their ideas on that subject might change as they depended on the value of their French assets. The board had no wish to maintain it at too high a figure, but at the moment it thought it wiser not to pay more than a 5 per cent. dividend and to use the balance of the profits in strengthening the reserve. The report was adopted.

Western Telegraph Co., Ltd. The annual meeting of the company was held on November 26th, the chairman, Sir John Denison-Pender, G.B.E., presiding. In moving the adoption of the report and accounts (*vide* our last issue, p. 869), the chairman said that the receipts, which had had a downward tendency since 1920, had increased, in spite of the low value of the Brazilian milreis, which had, however, recently improved. The general reserve had been debited with the cost of a very important renewal of cable, some 550 miles, at a cost of £131,278, replacing the last remaining portion of the original cable laid in 1874 between St. Vincent and Pernambuco. The chairman expressed his thanks to the staff for their assistance in effecting economy in expenses. The new cable ships, the cost of which had been debited against the maintenance ships' fund, had been thoroughly tested on repairs and found satisfactory. The company followed the practice of augmenting the pensions granted from the Associated Companies' pension fund; this cost £10,000 during the year under review. The negotiations for a wire between Paris and London had made little headway, but it was hoped that the French would admit the justice of their application. The Italian cable to South America had been opened for traffic, but it was too early to say what the effect of that competition would be. South America was undoubtedly a great field for development, and the company had a well-equipped and efficient system which was giving satisfaction to its clients. So far, the Argentine radio station had had no effect upon the company, being engaged upon the cheaper class of traffic. In concluding his speech, the chairman briefly referred to the recent International Telegraph Conference, the formation of the International Cable Companies' Association, and the appointment of the Earl of Bessborough to the board.

A quarterly dividend of 5s. per share, tax free, has been declared by the company.

Venezuela Telephone and Electrical Appliances Co., Ltd. The report for the year ended June 30th last shows a profit of £35,033 (including £116 surplus from corporation profits tax provision). After meeting loan and debenture interest and income tax, there is a balance of £24,940, which it is proposed to distribute as follows:—Dividends of 8 per cent. on the cumulative preference and ordinary shares; £800 to first debenture sinking fund; £10,000 to reserve for depreciation and renewals; and £5,390 to undivided profits account. An increased demand for service was experienced, and to meet this demand further capital is needed. It is therefore proposed to double the capital by the issue of 70,000 each of £1 preference and ordinary shares; this proposal will be put before the shareholders at the annual meeting on December 15th.

Barcelona Traction, Light and Power Co., Ltd.—It is announced that the whole of the company's 7 per cent. 50-year prior lien "A" bonds outstanding on June 1st, 1926, will be redeemed on that date at 110 per cent. A quarterly dividend of 1¾ per cent. has been declared on the cumulative preference shares.

Stock Exchange Notices.—Dealings in the following have been specially allowed by the Committee under Rule 159:—

Argentine Light and Power.—134,189 7 per cent. preference shares of £1 each, fully paid, Nos 865,812 to 1,000,000.

Singapore Traction Co.—93,739 ordinary shares of £1 each, fully paid, Nos. 1 to 93,739; 152,890 7 per cent. cumulative preference shares of £1 each, fully paid, Nos. 1 to 152,890; £200,000 6 per cent. first mortgage guaranteed debenture stock, issued at 94½ per cent., £20 10s. paid.

Burmah Electric Tramways & Lighting Co., Ltd.—The receipts for the year ended July 31st last amounted to £50,023, and after deducting expenses, taxation, &c., and adding £4,672 brought forward, £2,899 profit on exchange, and £1,591 interest on investments, there remained £29,129. It was proposed to place £11,605 to general reserve and depreciation, to pay a final dividend of 4½ per cent. on the ordinary shares (making 7½ per cent. for the year), and to carry forward £2,824. The previous year's dividend was 5 per cent. The meeting was to be held on Wednesday last.

Electrolytic Zinc Co. of Australasia, Ltd.—A gross profit of £510,073 was recorded for the year ended June 30th last, after transferring £140,000 to the depreciation reserve, and the net profit was £375,380, which sum was raised to £474,301 by the balance brought forward. The main building programme, it is reported, has been completed, and the production of metals is said to have been satisfactory during the past year.

John I. Thornycroft & Co., Ltd.—A final dividend of 3 per cent. is recommended on the preference shares, making 6 per cent. for the year, and it is proposed to distribute 5 per cent. on the participating preferred ordinary shares in respect of the year ended July 31st last. Last year no dividend was paid on the preferred ordinary.

Johnson & Phillips, Ltd.—It is reported that the company will shortly offer to its shareholders 100,000 new £1 ordinary shares at 40s. each, new capital being required to cope with the company's expanding business. The proportion of allotment will be one new share to each five already held.

Drake & Gorham, Ltd.—The report for the year ended June 30th last shows a net profit of £2,902, as compared with £3,842 in the preceding year. To this is added £283 brought forward, making £3,186, of which £3,000 is put to reserve and the balance carried forward.

Melbourne Electric Supply Co., Ltd.—A dividend of 5 per cent. actual, free of tax, has been declared on the consolidated ordinary stock for the six months ended August 31st last, making 10 per cent., free of tax, for the year.

Chloride Electrical Storage Co., Ltd.—An interim dividend of 5 per cent., tax free, is announced. A similar dividend was paid last year, since when the ordinary capital has been increased by a bonus issue.

New Issue.—*Lancashire Electric Light and Power Co., Ltd.*—Letters of allotment and of regret were posted by this company last week in connection with the recent issue of preference and ordinary shares.

Rees Roturbo Manufacturing Co., Ltd.—The report for the past year reports an increased turnover resulting in a profit on trading of £2,628. In the preceding year there was a loss.

Public Announcements.—*Kaministiquia Power Co., Ltd.*—For the information of the public and to comply with the Stock Exchange requirements, this company made an announcement of its capitalisation, objects, &c., in the *Financial Times* of December 1st.

Singapore Traction Co., Ltd.—A similar announcement by this company appeared in *The Times* and *Daily Telegraph* of the same date.

Pennsylvania Water & Power Co.—A dividend of $2 per share has been declared in respect of the quarter ending December 31st.

Yorkshire (West Riding) Electric Tramways, Ltd.—A final dividend of 3 per cent. has been declared on the 6 per cent. cumulative preference shares.

Globe Telegraph & Trust Co., Ltd.—A quarterly dividend of 5s. per ordinary share has been declared.

Stocks and Shares.

MONDAY EVENING.

THE advent of December quickens the flow of new issues anxious to make their appearance before the Christmas holidays. As the end of the year comes into sight, there is invariably an impression that money may become a little tighter, and this has the effect of arousing emulation in the minds of borrowers who want to place their issues upon as good terms as possible. It is said that several of the electrical and cable equipment companies contemplate joining the hosts of those

who are now appealing for public subscriptions to their shares. Provided that the companies follow the example of Johnson and Phillips and offer new shares at prices that will afford present proprietors a bonus upon their holding, there is not likely to be much complaint amongst shareholders at the willingness of their directors to take advantage of the abundance of money available for subscription to new issues, provided that these are of sound character.

The campaign continues for the sale of bonds and other securities in American utility companies. Two or three further prospectuses have reached us during the past week, offering what may be soundly-secured investments in various United States corporations that deal with such public services as electric lighting, power and traction. It would appear, therefore, as though the efforts of the vendors of these bonds to place the stock amongst British investors, are meeting with success. It may be reiterated that while so many useful openings are presented in this country for employment of capital in electrical channels which, besides proving good investments, serve to give employment to our people as well as to circulate the money in this country, the home investor will be better advised to confine his attention to companies in which there is a Stock Exchange market on this side, and which operate here.

The London & North-Eastern Railway, before the London Traffic Advisory Committee, said that the electrification of its suburban lines had been under consideration for nearly three years. Estimates worked out to £80,000 per mile for the electrification only, and the total cost would probably be nearer £100,000 a mile when other things were taken into account. These estimates made no allowance for rolling stock. The directors, therefore, regretted that they could not adopt the scheme prepared for the extension of the electrified system to Wood Green. North-Eastern ordinary stocks stand low in the market, and the Company's attitude is not difficult to understand. Home Rails are dull, though Central London assented ordinary at 67 is a point higher on the week.

St. James' Electric Supply ordinary are the fraction better at 15¼. County ordinary recovered to 58s. 3d., and Bournemouths to 59s. 6d. The new Richmond Electrics rose to 8s. premium before reacting sixpence. Lancashire Electrics lost a similar amount; active dealings are in progress in the new shares. The preference can be sold at 2s. premium, and the ordinary at about the same profit. The issues were well oversubscribed. Quiet regret is expressed at some of the conclusions recorded in the annual report of the Electricity Commissioners. The statement mentions that many schemes are delayed pending some definite action on the Weir Committee's report. Progress is tantalisingly slow in the matter of grouping adjacent districts in order to provide them with adequate electric power at a rate cheap enough to act as a real stimulus to industry. Meanwhile as the Home Authorities dally, the vendors of American Utility securities are vigorously engaged in the attraction of British capital into power schemes in the United States.

Metropolitan-Vickers are steady at 27s., on the announcement that the company, in conjunction with Vickers, has secured an important contract connected with the Bristol Corporation's project of electrical extension. Johnson & Phillips eased off to 57s. 6d.: it is said that the company is about to offer 140,000 new ordinary shares, at 40s. each, to its shareholders. Five old shares will give the right, according to report, to an allotment of one new share at £2, thus ensuring a comfortable bonus. General Electrics, ordinary and preference, are both rather firmer, but Edisons shed a few pence, and declines have occurred in British Aluminium and British Insulated.

No news had transpired up to Monday night to account for the strength of International Automatic Telephones. The price has further advanced to 36s. Automatic Telephones are ninepence up, at 52s. United River Plates eased off to 7½, at which price the shares can be bought. Oriental Telephones also are a little lower.

A drop to 22s. 6d. in Marconis followed the appreciation of the serious nature of the strike amongst some of the wireless operators. Holders of Marconis had already experienced a little uneasiness in regard to the dividend outlook. A good many Marconis have been sold recently in order that the money might be spent in the more popular rubber shares. The concatenation of adverse circumstances combined to depress the market and the spirits of the proprietors. Canadian Marconis fell to 5s., and Radios have been very weak, though rallying from the worst.

Venezuela Telephone & Electrical Appliances ordinary changed hands at 22s. on the issue of a report which foreshadows a possible offering of new shares. The company is paying 8 per cent. on the ordinary and preference, and the report exhibits excellent progress. Argentine Tractions are quiet: Brazilians show no change: Barcelonas have been fluctuating between 31 and 29½. In Mexicans, the only alteration is a 10s. rise in the Light & Power Company's first mortgage bonds.

Eastern Telegraph ordinary shed 2½ points upon the closing-up of a deceased account, the rest of the Eastern group remaining passive. Anglo-American deferred strengthened to 24¾. The Engineering shares, with their allies, are tolerably firm, although a recent speech by Lord Furness was not calculated to arouse optimism in regard to the immediate outlook for trade. The rubber share market manages, by reason of the strength of raw rubber, to absorb widespread interest and to demand increasing amounts of capital that have frequently to be drawn from realisations of stocks and shares in other markets of the Stock Exchange.

Industrial Germany in 1924-5.

THE Department of Overseas Trade has issued a report on the economic and financial conditions in Germany in 1924-25 by Mr. J. W. F. Thelwall, M.C., Commercial Secretary to H.M. Embassy in Berlin, together with a report on the industries in the occupied territories by Mr. C. J. Kavanagh, Commercial Secretary at Cologne.*

The fact is recalled in the former report that of raw materials Germany through the war lost most in coal and ore, the latter being a definite loss to be balanced by imports. Besides coal, which is at present being over-produced, there is a very large output of lignite, the use of which was much extended during the time of the shortage of pit coal, and which is also a great factor in the generation of electric power. The power development of the country is in process of evolution and will eventually, it is claimed, be based upon oil derived from coal distillation and electricity from water power. A process of distillation commercially profitable for both coal and lignite is considered to be probably only a matter of time having regard to the experiments being carried out.

Competition with England.

Coming to consider the part which German industry is to play in the world, particularly with respect to England, it is mentioned that during the past year Germany has had some notable successes in competition for foreign orders for railway work, constructional equipment, and shipbuilding. A careful consideration of all the circumstances leads to the conclusion that the two points which are decisive in the long run in a comparison between the two countries, are organisation and labour. In numerous cases when Germany and England meet in open competition the former receives the award on account of its lower tender. On the question of the relative position of the two countries from the standpoint of taxation, it is submitted that, when all allowances are made, it is probable that the ratio of total taxation to total national income was no greater in Germany in 1924-25 than in the United Kingdom. When, however, the tax revision now being discussed has been passed by the Reichstag, the former will almost certainly be paying less. In the matter of fuel and power, the report considers that the advantage lies with the Germans, who have large supplies of lignite and cheap electricity at their disposal, and whose pit coal, if the pit-head price is about the same as in England, can be more cheaply transported owing to special railway rates and excellent inland waterways. This raises the question of transport in general, and here the Germans are said to be much better off; not only have they special rates for coal, but also for many other kinds of raw materials and manufactured articles. Moreover, production is assisted by reduced rates for raw material, and the export trade is promoted with the aid of preferential rates between inland stations and the outlet ports. A further factor which often enables the Germans to compete successfully in external markets is the existence of a difference between the inland and the export prices. Being secure behind a wall of high tariffs and import prohibitions, producers habitually charge high prices at home and lower ones abroad, thus assuring for themselves as large profits as possible in the markets free from competition, and capturing as much trade as they can where competition exists. The absence of rivalry within the country, apart from protection, is due to the close organisation of industries, which thus indirectly helps exports; and in some cases the syndicates also grant export premiums. With regard to Government subsidies, either direct or indirect, the only cases which are known refer to production and apply to shipbuilding and the agricultural industry and the makers of machinery for this branch.

Hydro-Electric Works.

A separate section of the report deals at some length with the question of the production of pit coal and lignite, imports and exports, the costs of production, sale prices, the Westphalian Coal Syndicate and other matters. This is followed by a consideration of the situation of the utilisation of water powers in the individual States. Bavaria occupies the leading position in this respect. According to statements made by the Bavarian Government, the average capacity of the total water power within this State, developed and undeveloped, amounts to 2,000,000 h.p., capable of yielding 12,000,000,000 kWh per annum. Down to the present time plant for 540,000 h.p. has been completed, or, say, 27 per cent. of the total available. In addition installations representing 50,000 h.p. are in course of construction, and preparations are in progress for the establishment of a further 145 installations of a total of 400,000 h.p., so that about one half of the total available water power in this State is in process of exploitation. The second position is assumed by Baden, where the State owns water power capable of producing an annual average of over 800,000 h.p., of which 200,000 h.p. has already been brought into use. The Minister of Finance announced in March, 1925, that it was hoped to arrive at an arrangement by which the Baden central system would be connected with the 200,000-V system of one of the largest lignite power stations on the Lower Rhine, while in the South it was intended to effect a connection with the Swiss stations. It was thus hoped that by the end of 1925 there would be a continuous supply from the Central Alps through Baden to the lignite station on the Lower Rhine that would make it possible to distribute and adjust enormous quantities of electrical energy. The transmission system of Baden has already been linked up, *via* Mannheim, with the works in the Palatinate, and a similar connection with the Wurtemberg system will soon be made. In Wurtemberg the State is reported to have at disposal water power amounting to an average of 250,000 h.p., and of this some 100,000 h.p. has already been put into use. In the case of Prussia a group of power stations based partly on lignite and partly on water is in process of establishment in the area between the southern part of Hanover and the Main, the latter being undertaken jointly with canalisation schemes of the Lahn, the Moselle, and the Saar, and a connection running from the Weser to the Main. After referring to water power utilisation in the Thuringian States and in Saxony the report proceeds to discuss the use of electricity derived from steam power in Western Germany, Central and Eastern Germany, Saxony, &c.

Electric Railways.

Apparently very little has to be recorded regarding the conversion of steam lines to electric traction. It is, however, mentioned in the part dealing with Bavaria that the Munich-Garmisch section has been converted and set in operation. This line brings the total length of electric railways throughout Germany up to about 432 miles, although it is stated that considerable additions will be made in the course of this year. In the case of Baden the Minister of Finance stated a few months ago that negotiations were then about to begin with the Reich Railway Company on the subject of the electrification of the lines passing through Baden.

Electrical Imports and Exports.

According to an appendix dealing with the imports of merchandise, the imports of machinery, vehicles, vessels and electrotechnical articles amounted to 189,871 tons of the value of 140.4 millions of marks in 1913, and to 190,565 tons and 120.9 millions of marks in 1924. On the other hand, on the basis of pre-war values, the exports of electrical goods, including machinery, are returned at a value of 240 millions of marks in 1924, 254.9 millions in 1923, 234.8 millions in 1922, and 290.3 millions in 1913. Passing on to a consideration of the shipbuilding, textile, aniline dye and motor car industries, the report comes to the question of the aluminium and glass and porcelain industries.

Aluminium and Porcelain.

It is recalled that in 1913 the annual production of aluminium in Germany only amounted to about 800 tons, the only works in the country being at Rheinfelden, the property of a Swiss firm; and about 15,000 tons of the metal had to be imported to assist in meeting the demand. During the war and in the absence of French bauxite the Germans decided to build large power stations on the lignite mines for the purpose of smelting the bauxite drawn from the large deposits which exist in Istria and Dalmatia. With the assistance of the Reich the Ver. Aluminium Werke was formed, and this concern constructed three works at Horrem near Cologne, Bitterfeld, and Rummelsburg, near Berlin. In addition the Erft Werke was constituted in 1916 and established an aluminium works at Grevenbroich on the Erft, while in 1917 the Ver. Aluminium Werke built the Lauta works. The industry was built up during the war on the lignite areas because the use of power from these sources could be effected very rapidly, but since the end of the war the industry has begun to move towards the cheaper water power in South Germany. Soon after the close of hostilities the works at Horrem and Rummelsburg were shut down; those which are now in operation are the Erft works with a capacity of about 12,000 tons per annum, the works at Bitterfeld and the Inn works, also with an annual capacity of about 12,000 tons. The actual production in 1924 was 20,000 tons, but is expected to be exceeded this year owing to the increasing use of aluminium in place of copper. The branches which work up the metal employ 35,000 persons and their annual consumption is put at about 24,000 tons.

Concerning the porcelain industry the report states that the production in 1924 is privately estimated at 80,000 tons, as compared with 56,000 tons in the previous year. The industry employs from 50,000 to 55,000 persons, 10,000 of whom work in the manufacture of technical porcelain, in which product Germany is said to have held the leading position until recently. The exports of insulating porcelain for telephones and telegraphs are returned as having amounted to 9,686 tons in 1913, whereas in 1924 the quantity was only 6,964 tons and in the first half of 1925 the tonnage exported was only 3,148.

Iron and Steel.

Some forty pages of the report by Mr. Kavanagh are devoted to the mining and metallurgical industries, particularly in Rhenish Westphalia. While the extensive information given on these branches will no doubt be found very useful for purposes of reference, it can only be regarded as a record of the past. Conditions in these industries change so rapidly that what was correct a few months ago may be no longer applicable. Even the statistics are old, whereas to-day not only is the production of iron and steel in Germany in 1924 known in England, but also the output brought down to the end of October, 1925. This backwardness is no fault of the author of this well written section and it is not peculiar to Germany. It can only be explained by the slowness of Government departments in this country, which do not possess and never will possess the zeal for prompt publicity which characterises private enterprise in any sphere of activity.

* Stationery Office, 5s. net.

An Engineering Exhibition at Cardiff.

On November 26th an excellent display of engineering equipment, mainly for colliery work, was opened at the Cardiff Drill Hall, under the auspices of the South Wales Institute of Engineers; it is to close to-morrow (Saturday). Electrical equipment for coal mines figures prominently in the exhibition, many types of switchgear, coal-cutters, conveyors, &c., being on view. Among the firms which show switchgear are MESSRS. A. REYROLLE & CO., LTD. (through Messrs. Haslam & Stretton, Ltd., their agents). Mining type pillars are exemplified by a 200-A, 3,300-V, 3-phase unit (fig. 1) which has qualified for service by passing the Sheffield University tests. The equipment is in two separate parts, a circuit breaker and a bus-bar chamber; the former part is movable and the latter fixed. Provision is made against all possible accidents by interlocking devices. It is possible to link up these units to form complete switchboards. A smaller type of pillar incorporating many of the features of the larger type is shown. The stand also bears examples of the company's gate-end switches fitted with heavy-current mining-plugs for use with coal-cutting machinery. These plugs are mechanically interlocked with the switch operating handle, preventing their withdrawal while the switch is on.

The "CEAG" MINERS' SUPPLY CO., LTD., has a representative collection of its lamps. Prominent among these is a gas-detecting lamp. In this the glass which encloses the electric lamp also houses a tiny oil-burner which is lighted electrically. By means of this, it is claimed, 1½ to 5 per cent. gas in the

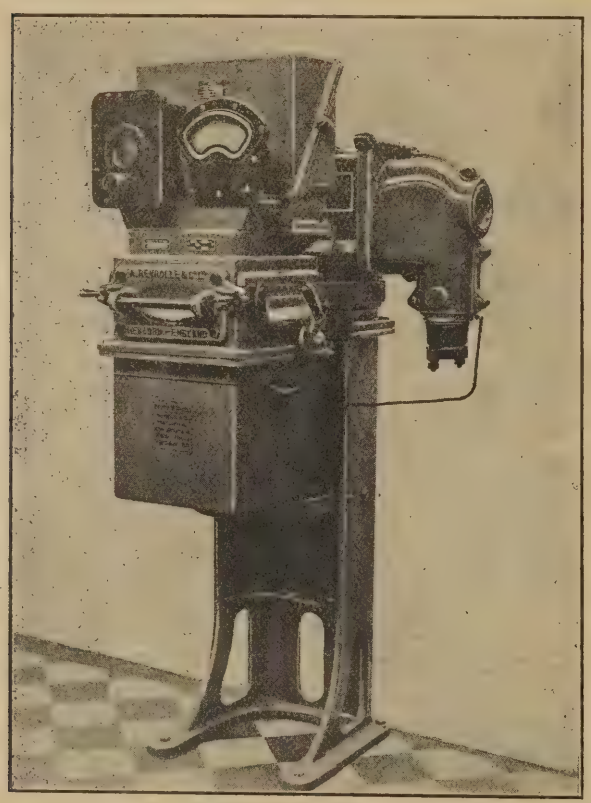

Fig. 1.—A Reyrolle 200-A, 3,300-V Mining Type Pillar.

atmosphere can be detected. A bayonet type of lid for lamp-accumulator cases is shown; this facilitates the dismantling and re-assembling of the lamp when cleaning it. Another accumulator lamp which is shown has a concentrating projector fitted in a swivelled head permitting the beam to be projected in any desired direction.

MESSRS. OLDHAM & SONS, LTD., also show miners' lamps, and one interesting feature of the display is a working model of a boy operating a machine for removing the accumulator lids and replacing them, to show the ease with which this is done. The company also shows a bulb-testing device, an arrangement which tests miners' lamps for shock, candle power, ampereage, &c. A number of accumulator batteries for mining and general applications are also displayed, as well as the "Oldham" stone-dusting machine.

MESSRS. HASLAM & STRETTON, LTD., who have already been mentioned, represent several firms, including the following:—British Arca Regulators, Ltd., whose section includes automatic regulators for the control of pressure, temperature, humidity, electrical pressure, &c.; the system was described in our issue of August 3rd, 1923 (p. 194). The De Laval Chadburn Co., Ltd., purifiers for lubricating and insulating oils. Messrs. Evershed & Vignoles, Ltd., contribute a set of their testing sets, including the "Meg," "Bridge-Megger" and "Megger" for high-resistance tests, and the "Ducter" and "Continuity Tester" for low resistances. This section of the exhibit also contains an example of the "Dionic" water tester for ascertaining the amount of impurity present in boiler feed or condensate. Filtrators, Ltd., shows plant for the prevention of the formation of scale in boilers, and Messrs. Spencer-Bonecourt, Ltd., have an exhibit drawing attention to their waste-heat boilers, &c. The Twiss Electric Transmission, Ltd., has an example of outdoor switchgear, a three-phase air-break switch with choke coils and horn tips mounted on poles.

MESSRS. JOHN DAVIS & SON (DERBY), LTD., show "Derby" miners' lamps and mine signalling equipment. A charging rack for lamps and a lamp-unlocking device are included in the display.

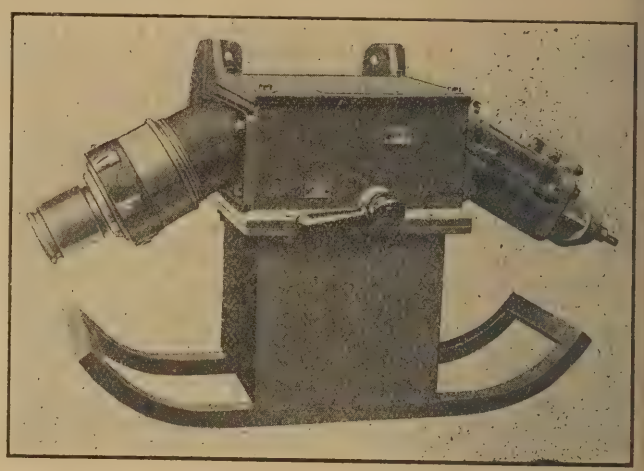

Fig. 2.—An "S & C" Gate-End Switch.

MESSRS. E. BENNIS & CO., LTD., have a model boiler front fitted with a chain grate stoker and a chain bucket coal elevator, in addition to a sprinkler stoker and self-cleaning compressed air furnace, and a section of "Liptak" flat arch.

MESSRS. SWITCHGEAR & COWANS, LTD., have a representative display of their mining-type apparatus. This includes a range of ironclad oil-immersed draw-out pedestal units showing the consecutive stages of construction. The main object of the exhibit is to demonstrate the reliability and safety of the equipment, as well as the ease with which the units can be coupled up and extended. The company's oil-immersed switchgear is represented by:—(i) The draw-out type with bus-bars, fitted with draw-out isolating plugs and a complete system of interlocks; (ii) the non-draw-out type, for wall or pedestal mounting separately, or, with a bus-bar chamber, for unit switchboards; (iii) gate end switches for the control of coal-cutter circuits (as illustrated in fig. 2); and (iv) combined oil-circuit breaker and transformer for tapping the power mains for colliery lighting. The first two classes are made in flameproof or non-flameproof form, while the last two classes are made flameproof. The internal mechanism and fittings of the switch portion are common to all four classes so that spare parts are reduced to a minimum. On the draw-out units the correct sequence of operations is ensured by means of simple mechanism providing a complete series of interlocks. The gate-end switch illustrated is a three-phase unit fitted with time-limit overload protection and also the Williams-Rowley system for ensuring adequate

Fig. 3.—An Anderson & Boyes Coal Cutter.

earth continuity throughout the system, including the coal-cutter. This equipment trips the switch if the earthing becomes inefficient, if the trailing cable is damaged, or if an attempt is made to withdraw the pommels from the switch or cutter. Other apparatus shown by the company includes induction regulators and boosters, colliery lighting transformers, &c.

The display of the ELECTRO-MECHANICAL BRAKE CO., LTD., consists mainly of controllers of flame-proof construction specially designed for use in mines. The principal exhibit is a steel-cased explosion-proof controller which incorporates a number of valuable features. The contact fingers are of ample cross section, and are fitted with renewable tips which are maintained in position by compression springs. The drum shaft and finger bar are mica insulated throughout, and the

drum is easily removed by the slackening of four bolts in the top plate. An indestructible arc shield which can be swung out of the case is fitted and ample wiring space is provided. An exhibit of note is a steel-cased air-break electric battery mining type controller, similar to that fitted on the locomotive which was recently awarded the £1,000 in the Markham competition. A type of controller for non-fiery mines is also shown. Other apparatus displayed includes three-position sealing and dividing boxes for mounting on the company's controllers.

The exhibit of MESSRS. ANDERSON, BOYES & CO., LTD., comprises three coal-cutting machines, two of which are electrical. The first is a 17-in. chain coal cutter suitable for long-wall, short-wall, or heading work, and the motor can be either d.c. or a.c. The gear head, motor and haulage gear are independent units and are fitted compactly together. The machine is steel-clad throughout and absolutely flame-proof. The machine illustrated in fig. 3 is an electric arc-wall cutter. This is the long-wall machine adapted to chain haulage. The haulage chain is led up each side of the machine, like two flexible arms, to embrace a specially-constructed gear head. When the machine is run into a heading, the jib can cut under power to either hand according to the pick setting.

On MESSRS. MAVOR & COULSON'S stand several types of coal cutter are shown. Two of these, one electric, have a height of only 12 in., enabling them to be employed in very thin seams. The electrical machine is of the chain type arranged to cut at floor level to a depth of 4 ft. The machine can be converted into a bar-type cutter, or into a compressed-air driven machine in a simple manner. An "abbreviated" shaker-conveyor driven by a three-phase motor is shown. An electric putter which is exhibited is described as a "missing link." It is a simple, compact and portable haulage gear rated at 8-10 h.p. It is primarily intended for mines in which the service between the coal face and auxiliary haulage is conducted by hand tramming and horses. Another machine on view is an electrically-driven air compressor, and the company also shows a selection of its controllers and other switchgear.

MESSRS. COWLISHAW, WALKER & CO. also exhibit examples of coal-cutting machines. The "Output Imp" cutter, similarly to the "M. & C." machine mentioned above is designed for thin seams, cutting at floor level, with a "reach" of 3¼ ft. An electrically-driven arc heading machine shown has a chain jib 7½ ft. long; the motor is wound for 500 V a.c. The firm also shows a d.c. longwall chain cutter with a 4-ft. overcutting chain jib. A belt conveyor, a three-phase oil-immersed controller, and a three-phase gate-end panel are further exhibits.

BRITISH BROWN-BOVERI, LTD., shows principally motors and switchgear. One item is a 20-h.p. three-phase induction motor with a built-in starter. The latter, including resistances and switch elements, is mounted on the shaft in place of the usual slip rings, and thus slip rings, brushes, and brush-lifting and short-circuiting gear are eliminated. An example of the firm's automatic pressure regulator is shown, as well as a typical pattern of its 3,000-V switches. This is fitted with three built-on overload relays which act directly on the tripping mechanism. This stand also bears an "A-S" refrigerating machine.

MESSRS. GENT & CO. have a miscellaneous collection of their products. This includes examples of the firm's mine signalling apparatus, telephone apparatus, and the "Pul-Syn-Etic" time-keeping system. A distance water-level recorder and indicator is exhibited. Another device which is shown in operation is a "staff locater" which enables the manager of a works to call a number of members of the staff by combinations of coloured lamps, operated by push-buttons, which are fixed in various parts of the works. A great deal of radio apparatus appears; this includes a 4-valve receiving set built of the firm's own components, headphones, loud speakers, coils, transformers, &c. A navigation-light indicator with means for switching on duplicate lights is another interesting exhibit.

MESSRS. A. E. SMITHSON & CO., LTD., include in their display a number of small electric tools, including a French planing machine which employs a rotary steel cutter driven by a 1.1-h.p. motor fitted in the body of the machine with the switch conveniently situated near the rear handle.

Electric haulage gear is shown by a number of firms, including CARRON COMPANY (a 25-h.p. worm-geared main and tail haulage gear with a rope speed of 6 m.p.h.) and JOHN MILLS & CO. (driven by a 50-h.p. B.T.-H. induction motor through a 5 to 1 reduction gear; motor speed 726 r.p.m.).

In addition to the foregoing many firms show equipment for steam plants, collieries, &c., as well as general engineering products, a full description of which is precluded by lack of space.

A Review of the Electrical Industry.

By A. G. ELLIS.

(*Abstract of Chairman's Address*: NORTH-WESTERN CENTRE *of the* INSTITUTION OF ELECTRICAL ENGINEERS.)

IF I touch on matters which may appear to be outside the purview of this Institution, I do so with the feeling that the Institution has broadened its basis from that of a purely scientific society by interesting itself in all matters vitally affecting the industry; and rightly so, since the Institution represents the corporate activity and voice of the electrical profession. In no times, as compared with the present, has the medium for corporate speech and action been so necessary, especially since the recent "discovery" of electricity by the politicians, who persist in the idea that this healthy 50-year-old child is still "in its infancy."

The vision of a completely electrified Britain should be our perpetual incentive. With abundant cheap electric power there would be a great demand for electrical appliances, both domestic and industrial, which would be highly standardised and produced in large quantities at low prices: our position in competition with foreign manufacturers would be enormously improved and markets, both at home and abroad, would naturally extend, filling the factories and contributing in no small measure to the reduction of general unemployment.

The carrying of the electric power supply on to the land throughout the country and its systematic and thorough application would increase the total food production and decrease the amount of imported food. Further, the widened range of cheap power supply would have the effect of transferring works and population to the country, enabling people concerned in industry to work and live under conditions fit for human beings and, in the course of time, eliminating that hideous product of modern civilisation—the large manufacturing town.

The anticipated new legislation with regard to electricity supply will again bring electricity prominently to the public notice, and the electrical industry would be well advised to take the opportunity of concurrent action in the education of the public. The occasion would be opportune for a widespread national campaign organised, I suggest, jointly by the Electrical Development Association (which is already doing excellent propaganda work), the I.M.E.A., the B.E.A.M.A., the newly-formed Women's Electrical Association and the I.E.E., to carry the gospel of electricity to the multitudes.

There is no difficulty in raising money for electricity supply undertakings. The capital expenditure on electricity supply has practically doubled during the past five years, and the dividends of the supply companies have shown a steady increase, now averaging over 6 per cent.

The increase in energy sold for the past year (March, 1924-March, 1925) has been roughly equal to the total increase for the four preceding years put together, which is a most encouraging result. The new plant involved has been almost exclusively of home manufacture, and, I believe, it would not require a great increase on this figure to rid completely the electrical and allied industries of unemployment.

So far as the manufacturers are concerned, there is no doubt that they are ready to meet any demands for new plant put upon them due to speeding up of electrical development. During the past five years great strides have been made in "heavy" electrical manufacture, and it may safely be asserted that the British manufacturer has caught up his "angle of lag" of some ten to fifteen years, and is now in phase with the American and Continental manufacturers. This is testified by the important orders secured by British manufacturers in the Colonies and in Russia, against American and Continental competition.

Recent progress relates principally to large turbo-generators and e.h.p. transformers and switchgear and automatic and supervisory control of stations. This country has recently exported a 50,000-kW, 1,800-r.p.m. turbo-generator, and 35,000- and 40,000-kW units, for 1,500 r.p.m., also for export, are in hand. In transformers and switchgear for pressures of 100 kV and over, British manufacturers have recently built, for export, apparatus aggregating over half-a-million kVA.

At home we have outdoor sub-station installations of British manufacture in operation at 66 kV and 33 kV, some of the latter plant having withstood for several years the most severe test possible for outdoor electrical apparatus, *viz.*, the climate of Manchester.

Testing transformers of 300 and 500 kV, for commercial testing of cables and insulators, have been built and are in successful operation, and 1,000,000-volt testing transformer equipment is under construction.

Perhaps the most remarkable development for some years is the automatic sub-station equipped for wholly automatic or remote supervisory control. The first automatic sub-stations in this country were put down only three years ago and the

excellent service obtained is vouched for by the engineers concerned and by the rapid spread of this type of plant. As an illustration of the saving in space and buildings, I might mention a subterranean station which is being put down in London, containing two 300-kW rotary converters with fully automatic control. This sub-station measures 28 by 15 feet and is entered through a manhole in the pavement, 5 by 3 ft.

Rotary converters up to 4,500 kW for 1,500-volt d.c. traction load, with automatic control gear, have been supplied to the Colonies. These machines are capable of being ready for supplying direct current in two minutes after receiving the starting impulse.

However, in many lines of standard electrical machinery and apparatus, under present conditions, the British manufacturer compares unfavourably with the American and German manufacturers. The reason is not far to seek; it is the advantage derived from the much greater total volume of electrical manufactures in those countries. The cure for this is to boost up the total electrical business in England, and get the benefits of manufacturing in larger quantities. To achieve this we have to look to expansion of the home market. We are already in the position of exporting about one-third of our total electrical manufactures, whereas the United States export only about one-tenth of their total, although the total cash value of the American and British electrical exports is about equal.

Of the total exports of electrical machinery and apparatus (including cables) from five leading industrial countries in 1924 (amounting to £53,000,000), Britain supplied 29 per cent., United States 31 per cent., and Germany 27 per cent., while France and Switzerland were practically responsible for the remaining 13 per cent. Thus, we are at present securing practically an equal share of the world's total electrical business with the United States and Germany; and, although our proportion has shown a slight increase during the past few years, no increase of great magnitude is to be expected in the near future.

Competition in the colonial markets is very keen and will become still more severe as soon as our principal competitors, America and Germany, no longer absorb the bulk of their electrical manufactures in their home markets, as they do at present.

Intimately bound up with this matter is the imperative necessity of cheaper cost of production of electrical apparatus. Without entering into the complexity of factors which are involved in this question, I consider that the keynote is quantity production; and herein the important factors with which we are concerned are:—(1) increase in demand and (2) standardisation.

(1) *Increase in demand.*—In the industrial field further application of electricity to mills and collieries is making steady progress, judging by the number of industrial electric motors turned out annually. No great expansion is to be looked for, however, until a general industrial revival sets in in earnest. There are, however, new fields of application, such as electric ovens for bakeries, to be exploited. An intensive programme of railway electrification would react favourably on the development of public electricity supply by widening the field of distribution and improving the load factor, due to the running of transmission lines through all districts touched by the railways.

In the domestic field the supply authorities are going out to create and develop the demand. The importance of the heating and cooking load as a means of improving the load factor renders the consumer taking power for these purposes as well as lighting, the most valuable for the supply undertaking to cultivate.

Development of rural electricity supply for agriculture is a field which is at last receiving in this country the attention it deserves. The politicians have already started dragging electricity into their schemes of land policy, so it behoves the engineer also to get busy.

Nearly one half the total area of Great Britain is farm land, comprising nearly half a million farms and small holdings. At present there are in Great Britain only about 400 farms electrically equipped, though it is anticipated that this number will be doubled in another year.

Here we lag far behind other agricultural countries, which are jointly responsible for about 1,000,000 electrically equipped farms throughout the world. There is thus, awaiting exploitation in this country, an enormous new field, of which the potential total demand for electrical energy is estimated at between 500 and 1,000 kWh per annum.

Apart from the problem providing a cheap and abundant power supply, the principal matters calling for present consideration appear to be:—

(1) The education of the farmer in electricity, and the electrical engineer in agriculture.

(2) Close co-operation between the supply undertakers, the Commissioners, and the Post Office to remove any difficulties in the way of the running of inexpensive overhead transmission lines.

(3) The manufacture of simple and inexpensive switch and transformer installations for tapping the h.p. transmission lines.

(4) An adequate system of hire-purchase and maintenance of electrical plant for farm installations.

Cheap power supply is largly dependent on the cost of transmission lines and tapping them. Any revision of existing rules and regulations should be in the direction of facilitating the obtaining of wayleaves for, and simplifying the standard of construction of, overhead h.p. transmission lines, rather than of framing special regulations, and it is to be hoped that the Electricity Commissioners will exercise a beneficent influence in this direction. Certain regulations are no doubt requisite to ensure the general safety of the public and livestock, but they should be as simple and unrestricting as possible. It can surely be left to the common sense of electricity undertakings which are pushing for rural supply, to see that any lines and installations they put down are both safe and sightly, constituting, as they do, one of the best forms of propaganda.

(To be concluded.)

The Work of the Electricity Commissioners.

The Fifth Annual Report.*

During the period covered by the fifth annual report of the Electricity Commissioners, which was issued last week, active consideration has been given by the Government to the question of the intensive development of electricity supply in Great Britain on a large scale for the industrial requirements of the country and the service of rural communities, and as a means of lessening the volume of unemployment. In July, 1924, the policy of the late Government with regard to electricity supply was outlined by the Chancellor of the Exchequer.

Following this pronouncement, the Commissioners were authorised to retain Messrs. Merz and McLellan to investigate and report upon the financial and practical aspects of a scheme of complete standardisation of frequency. The report, which embodied a suggested programme showing in detail how the change-over might be effected in a large non-standard area, was made to the Commissioners in November, 1924, and was duly submitted to the Minister of Transport with the recommendations of the Commissioners for the consideration of the new Government.

The Commissioners were also authorised to confer with the Incorporated Municipal Electrical Association, the Incorporated Association of Electric Power Companies, and the Provincial Electric Supply Committee of the United Kingdom as to the formulation by their constituent members of main transmission schemes; and with the Cable Makers' Association and the British Electrical Development Association as to the constitution of a distribution and, if necessary, a house-wiring organisation for the development of rural supplies in accordance with two trial schemes the outlines of which had been prepared by the Commissioners.

In consequence of the change of Government in the autumn of 1924, further consideration of the last-mentioned matters and of the numerous schemes of local development received by the Commissioners from authorised undertakers had necessarily to be deferred pending a decision by the new Government as to the policy to be followed. With the latter end n view, the Government appointed a Committee under the chairmanship of Lord Weir of Eastwood to consider the general question of the immediate and future electrical development of the country, the Chairman of the Electricity Commissioners acting as technical adviser to the Committee. At the date to which this report is made, the investigations of the Committee had not been concluded.†

While these important investigations preliminary to a decision on policy were in progress, the Commissioners necessarily felt constrained from proceeding with the initiation of new schemes of reorganisation, and attention was largely concentrated upon the concluding stages of schemes for certain Electricity Districts which were in an advanced position at the commencement of the period under review.

An outstanding feature of the administrative work of the Electricity Commission during the past year was the completion and publication of a return of authorised undertakers, and of a return of engineering and financial statistics in a comparative form. The Commissioners propose to issue a similar statistical return for the two years 1923-24 and 1924-25 at as early a date as possible, and to publish an annual return thereafter.

Authorised Undertakers.

On March 31st, 1925, the number of local authorities, companies and persons in Great Britain holding statutory powers relating to the supply of electricity was 568 (England, 275 l.a. and 191 c.; Wales, 38 and 14; Scotland, 25 and 25; total for Great Britain, 338 l.a. and 230 companies). The number of separate undertakers was 565.

† The Committee presented its Report to the Minister of Transport in May, 1925.

Generation of Electricity.

The monthly returns rendered to the Commissioners in respect of the generating stations of authorised undertakers in Great Britain, including the voluntary returns in respect of generating stations owned by railway and tramway authorities, and by a number of non-statutory undertakings, show that the total energy generated amounted to 7,415,375,529 kWh, the fuel consumed being 7,892,396 tons of coal, 95,436 tons of coke breeze, and 54,410 tons of oil. Of the total energy generated 6,047 million kWh was produced by authorised undertakers and 1,368 millions by traction and non-statutory undertakings. As compared with the previous year, the returns show an increase of about 11 per cent. in the number of kWh generated, and an increase in the consumption of coal and coke of about 6 per cent. The consumption of oil fuel showed a decrease of about 19,000 tons, a reduction of about 24 per cent. on the consumption during the preceding year. Continuous progress has been made since 1920 in the more economical utilisation of fuel for the generation of electricity in Great Britain.

Of the 584 stations dealt with, 255, or 43.7 per cent. of the total, generated less than 1,000,000 kWh each during the year under review, while 434 stations, or 74.3 per cent. of the total, generated less than 10,000,000 kWh each. There was an increase of 43 in the total number of stations submitting returns, partly attributable to the fact that certain authorised undertakers owning more than one generating station submitted a separate return for each station instead of a consolidated return for the undertaking as a whole, as in former years. The actual number of new stations which came into operation was 23.

Although it has been the consistent endeavour of the Commissioners since 1920 to bring about the supersession of small-scale generation in a multiplicity of stations, they have nevertheless found themselves in the position of having no alternative but to sanction the establishment of further small generating stations in various parts of the country.

The provision of such stations has proved to be the only method of meeting, for some years to come, the demand for electricity which has been shown to exist in a number of rural and other isolated areas, and in the exercise of their duty of promoting the supply of electricity the Commissioners have felt constrained from taking a course of action which would have debarred the initiation of local development for an indefinite period pending the establishment of comprehensive transmission and distribution systems from which bulk supplies could be made available over wider areas than hitherto.

While the supersession of small stations has not proceeded as rapidly as the Commissioners had hoped, since the establishment of the Commissioners in 1920, local generation has been discontinued at 54 small stations, and 21 other stations have been relegated to the position of standby.

Consumption of Electricity.

With regard to the sale of electricity in Great Britain by authorised undertakers, the energy sold in the calendar year 1924 by local authorities was 3,167,387,569, an increase on 1923 of 14.8 per cent., and by companies 1,830,575,684, an increase of 15.8 per cent., the total being 4,997,963,253. As compared with 1923, the sales of electricity thus showed an increase of 15 per cent.

On the basis of the Census Return for 1921, the energy sold by authorised undertakers in 1924 represented an average consumption of the order of 117 kWh per head of population in the whole of Great Britain. This figure does not take account of the supplies generated at the stations of railway and tramway authorities, or of the further large supplies generated privately at stations belonging to industrial and commercial organisations, and accordingly provides a partial measure only of the *per capita* consumption.

(*To be continued.*)

Electricity and Housing Schemes.

An Interesting Discussion at the Public Works Exhibition.

In a paper presented by Mr. R. Hardie, of Glasgow, under the auspices of the Incorporated Municipal Electrical Association, at the Congress arranged in connection with the Public Works, Roads and Transport Exhibition, the author discussed the uses of electricity for housing and institutional purposes; he remarked that we had almost, if not quite, reached the point when "everyone wanted electricity," and the task on which electrical men were to-day engaged was to demonstrate that the electricity supply cable which had perforce to be led into a building for lighting could at the same time be usefully employed for cooking, heating of apartments, ironing, and even water heating. "All-electric" houses could be erected and equipped as cheaply as the nineteenth-century house, with its coal range and coal fires within, and disfiguring exterior chimneyheads. Let housing authorities, therefore, co-operate with us in the provision of houses meeting modern scientific requirements; let us divorce ourselves from traditional practice, and provide "twentieth-century houses." It was unreasonable to expect supply undertakings to extend their distributors, erect sub-stations and lay services, for merely lighting demands, lasting at most for a few hours daily in the winter only. The cost to the undertaking of giving the supply would in some measure depend upon the distance from the generating station. For example, in a Glasgow suburb, five miles from the generating source, the cost of laying high- and low-pressure mains, service cables, meters, and providing sub-stations amounted to £20 per house—a considerable sum. Most of the houses started with electric lighting and an iron; gradually, some installed fires and cookers, and the demand reached 545 kWh per annum per house in 1924.

This average figure was still increasing and illustrated the uneconomic nature of a purely lighting demand from a scheme such as this. The Municipal Buildings at Glasgow had an annual consumption of close on a quarter of a million kWh per annum, of which 14,000 kWh represented cooking alone. The main heating was done by central heating systems. Some hundreds of electric fires were scattered throughout private rooms, offices, &c., where additional local heat was required, and also numerous special heating installations, *e.g.*, an equipment for the city bacteriologist to maintain for 24 hours daily a temperature of 60 deg. F. in the animal house. In one of the City hospitals they were arranging for the installation of electric heaters supplementary to the hot-water radiators, mainly for use during the night. Electricity for these would be supplied at a price making its use competitive and attractive.

Perhaps one of the most interesting and useful recent applications of electricity was the "ultra-violet" treatment. Installations were in use in hospitals, children's clinics, and infirmaries, where it had been established beyond doubt that the treatment had been extremely beneficial. A particularly happy example of co-operation between officials was to be seen at Poplar, resulting recently in electricity superseding in turn coal and gas for heating weekly 4,000 gallons of water at the public baths. A steam-electric equipment might be considered the ideal combination for any large kitchen, *i.e.*, steam for boiling operations and electricity for baking, roasting, grilling, &c. The electric kitchen was rapidly growing in favour with professional caterers, the managements of restaurants, clubs, &c., whose judgment on the value of electrical equipment must carry weight with those who did not claim to possess specialised knowledge of such matters.

In advocating a change-over to electricity for street lighting, Mr. Hardie said the expenditure could probably be recovered in a short time in reduced policing costs. He pleaded with borough surveyors and those authorities who licensed electric signs not to make their restrictions more onerous than necessary, consistent with public safety.

Discussion.

The development of electricity, said the Chairman, Mr. R. B. MITCHELL (Pres. I.M.E.A., and city electrical engineer, Glasgow), in its domestic aspect promised to grow even more rapidly in future than it had done in the past, and the formation of an Electrical Association for Women suggested that the interest in electricity was becoming still more general. Mr. Mitchell expressed his appreciation of the fact that the Congress Committee had seen fit to include an electrical paper in its programme.

Opening the discussion, Mr. G. W. KEATS (borough electrical engineer, Woolwich) said that his Council had erected 670 "all-electric" houses. The whole of the tenants were satisfied with them so far as the Council could see, but they had found the lack of tuition of the ladies occupying the houses as to the uses of electricity a very great problem. Ladies who had been educated to cook by gas were not yet quite efficient to teach cooking by electricity, which was a subject at some of the L.C.C. schools. Unless they educated girls, who were the women of the future, they would be in difficulties the whole time.

Mr. S. H. MORGAN (borough surveyor, Rochdale) said his Council was now building "all-electric" houses, and he would like to know what, in Mr. Hardie's experience, was the cost of servicing an all-electric house. He took it that the mains were laid free. At what price per kWh did electricity become an economical proposition for heating and cooking in houses? All the figures in the paper were based on a cheap supply.

Mr. T. FROST (Wolverhampton) commented on the unusually large number of ladies present. He was all in favour of trying to electrify houses, particularly the poorer houses.

Mr. J. LEADBEATER (borough electrical engineer, Hampstead) referring to the cost of wiring as set out in the paper, said he noticed that the screwed-barrel work, by direct labour or contract, seemed to be done at a lower price than one could get anything done for in London. He had had about 1,000 contracts in the last twelve months, and he did not get any done for less than 22s. per point with slip-barrel and grip fitting.

Mr. C. KEELING (Heanor, Derbyshire) asked for the cost of service to a cottage, and how it compared with the cost of gas.

He thought that was a great question for the working class. The cost for cooking and heating seemed to be out of the reach of the average working man.

Mr. OSBORNE (Welwyn Garden City) said that at Welwyn, so far as middle-class houses were concerned, there was very great interest in the development of electricity for cooking, heating, and other domestic purposes. The Council was very anxious to extend the use of electricity, particularly to the working-class houses. In that class of house, to get a return for overhead expenses, they had to make something in the nature of a fixed service charge, and then sell the remaining energy at a very closely cut rate, for heating and cooking. This was satisfactory from the point of view of the Council and the consumer. They kept their flat rate up deliberately, the object being to encourage the use of electricity for purposes other than lighting. They did not see why the man who only used electricity for lighting should get it more cheaply and advantageously than the man who used it for other purposes as well. He suggested that a meter should be designed which would give so many kWh at a contract high rate, after which the meter would automatically set itself, and the rest of the kWh would be obtained much more cheaply. He thought that such a meter would enormously increase the use of electricity amongst the working class. They would get a greater diversity of load, for the habits of the middle and working classes were different, and both types of consumer would not need power for cooking at the same times of the day.

Mr. L. L. ROBINSON (borough electrical engineer, Hackney) said he dealt with a population, a large percentage of which was really poor. He did business most easily with the poorer people, who seemed to find it necessary to economise by using electricity. Apparently this was because the poorer housewife had to do her own housework, and so needed mechanical help, whereas the richer woman could afford to keep servants. As a result of putting installations in the poorer houses on the free wiring installation prepayment system, they had found that one had to charge rather a high price per kWh; he was almost ashamed to say that at Hackney they charged 8d. per kWh for lighting and 1½d. for cooking and heating, but those prices compared favourably with those of gas. The question of the day was: How on earth can people afford to burn gas? As to the meter suggested by Mr. Osborne, it would be perfectly easy to design one which would simply change gear after a number of revolutions, but there would have to be a large number of different gears in the meter. The number of units which would have to be supplied at the high rate would depend on the installation, but they would have to get over the difficulty of a quarterly fixed charge on all kWh not based on the flat rate. With regard to water heating, he wanted to expose the fallacy (advanced by those interested in the supply of gas) that with gas 80 per cent. of the heat of the coal went into the water, and with electricity only 15 per cent. With water heating in an ordinary geyser, of the 80 per cent. of the heat in coal, only a little went into the water. In the case of electric heating with a thermal storage tank, 90 per cent. of the energy went into the water. He had recently tested several types of water heater; some of them used 30 kWh per week in radiation losses. One English type used 20 kWh, but a Swiss type only used 10 kWh. Mr. Robinson emphasised the value of careful lagging, and proceeded to say that his charge of 0.6d. per kWh for water heating was found to be fully competitive with gas. He disparaged the idea of charging less than 1d. for cooking, on the ground that a little reserve should be kept for developing the cooker. In conclusion, he asked if it were not a fact that the gas offices in Glasgow had had to be lighted by electricity because it was unhealthy for the staff to work in gas-lighted rooms?

Mr. H. E. FOLKES (surveyor to the Lye Urban District Council) stated that his Council had lately considered lighting the streets by electricity instead of gas. He asked for advice as to the methods of fixing the lamps, and what was a reasonable charge per lamp for eight months?

Councillor Mrs. GREGORY (West Ham) asked why flats which had been erected at Glasgow to re-house slum dwellers had not been lighted with electric light. West Ham Council was going to build flats, and hoped to have not only electric light, but cooking also. She paid 1½d for cooking and heating. Comparing a year's bill for electricity with a previous year's figure for gas, she found she had saved 2s. 6d. As to educating women, at West Ham they asked women with electric cookers to allow an official to bring to her house another woman in order to illustrate to her the working of the cooker. In most cases this was gladly done.

Mr. S. P. COLLINGE (borough engineer, Sunderland) asked if the whole of the water at the Poplar public baths mentioned by Mr. Hardie was heated by electricity. He said that the Town Council of Sunderland had been converting the street lighting from gas to electricity at the rate of 200 lamps per year. This would have taken some time to complete, so the Council obtained sanction to a loan from the Unemployment Grants Committee for converting the whole of the lamps and laying mains in about 80 streets. It was not putting many new standards up, but was mostly using the old gas pillars, with swan necks.

It was observed by Capt. L. J. Kettle (city electrical engineer, Dublin) that at the Gas Conference that morning the president of the Institution of Gas Engineers had said that all sorts of impartial public authorities were acting on the assumption that electricity should be given the monopoly for lighting and other purposes. The gas company was a very good customer of the Dublin authority, but with regard to the aspect of the question dealt with by Mr. Hardie, they all kne that electricity was cheaper. In many of the big industri cities the industrial part of the supply was so big that t domestic supply was a very small part of the total output. Dublin they had no such industrial load, and were th compelled to go very closely into the question of economy wi the domestic supply. Ladies, in his experience, needed ve little education in the use of domestic electrical appliance For flashing signs, gas could not compete with electricity, b he thought it should be a penal offence to put up anything the character that was seen in Piccadilly Circus.

Mr. A. W. BLAKE (electrical engineer, Willesden Urban Di trict Council) said that during eighteen months his Counc had converted 3,000 gas street lamps to electricity. The ol standards were used and the total cost was about £30,00 With regard to tariffs for domestic work he explained that h system, where the consumer had been connected for two three years, was to take the average current supplied durin that time, add 10 per cent., and then halve the total, for ligh ing. The consumer was asked to sign an agreement to pa this minimum charge, and then everything else used for othe purposes was charged at 1d. per kWh. A difficulty with in stalling electricity in the poorer districts was that so much the wiring was unfortunately badly done. They must ge down to the problem and remove a lot of the weaknesses o domestic electricity, and get the ladies to help them.

Closing the discussion, Mr. MITCHELL said there wa 800 all-electric houses in Glasgow. That number might hav been added to, but for the fact that the areas in which th Corporation was now building were outside the area of th municipal supply. At the present time there were 7,000 elec tric fires on hire from the Electricity Department. The wirin on the housing schemes was so cheap because of the extrem competition by small contractors. The wiring was done whe the house was in shell form, which made progress very muc easier; one house was like another, and a great deal of th work could be done before going on to the site. Speaking o the ultra-violet ray treatment, he said he was sure it woul develop to a very great degree, especially as regarded the cur of rickets in children. The percentage of cures was practi cally 100 per cent. They had a good deal of it in Glasgow where it was carried out by the Public Health Department and they were crying out for more. He had not, so far found it necessary to supplement the existing mains in orde to extend the domestic supply.

Mr. HARDIE, in his reply, agreed that something woul have to be done in the way of educating people in the uses o electricity. In this connection possibly the new Women's Elec trical Association would be able to suggest something. Fo reasons beyond his control he had had in the last two years several ladies in his house operating the electric cooker. N instruction had been given them, but they experienced no diffi culty. It was necessary to get away from the idea that some thing like a year's training was necessary before one could operate an electric cooker. He believed in instructing the older children. At present the cost of electricity at Glasgow for purposes other than lighting was ¾d., and for lighting it was 4½d. per kWh. They had a fixed charge and a low running rate of ½d. for power, which applied to any consumer, although he must be a generous user of electricity. He was quite satisfied that they could compete with gas at a price of 3s. 7d. per 1,000 cubic feet, even at the rate of 1d. per kWh. The cost of giving service to a house depended upon its distance from the generating station, but he had given an average figure of £20. He agreed that the question of a prepayment meter was one of the problems they would have to tackle. They had to get the working-class houses changed over from gas to electricity, and follow the gas undertakings in that they had installed thousands of slot meters. As to the new flats mentioned, it was out of the question to lead a double supply to them. Cost was the most important factor, and the Housing Committee had considered that the class of tenant would not be too well able to handle electric equipment. But Mr Mitchell had arranged in connection with some future schemes to install penny-in-the-slot meters.

The Underground Railway and Snow.—The Underground Railways, by the use of snow appliances, were able to run "almost uninterrupted" services of trains, except for slight trouble in the exposed section between Edgware and Golder's Green, during the snow fall last week. On the District Railway during the night trains were run on the outer sections, fitted with special ice-scrapers and snow brushes in order to keep the rails clear of non-conducting elements. The trouble is not so much snow or ice, but a combination of the two of the consistency of sleet. Snow, unless lying several feet thick, can be removed by the shoes and the wheels of the trains; ice, being brittle, is susceptible to concussion and can be removed quite easily, but sleet is tenacious and adheres to the rails. Heating the rails by electrical means has been tried, but without appreciable success. The company is experimenting with an oil-spraying machine which ejects warm oil over the surface of the current rails; by this means moisture is unable to lie on the rails, and the formation of ice is prevented. In addition to the special trains which are operated for the removal of sleet, about one-third of all service trains are fitted with sleet brushes of hard steel which can be adjusted to scrape along the surface of the rails to remove any obstruction.

Legal.

Unprotected Machinery.

AT the Scunthorpe Police Court last week the North Lincolnshire Iron Co., Ltd., was summoned for not having the gears of an electrical overhead travelling crab securely fenced as required by the Factory and Workshop Act; in consequence of this neglect an employé named Branson was killed.

For the prosecution Mr. C. J. Paterson, Inspector of Factories, described the case as one of the worst there had been in that district for years.

A brother of the deceased, Robert Ernest Branson, said deceased's job was to look after the crab, and if the travelling wheels were running hot, to put grease in.

Capt. A. Walker, shirt manager, stated that he had never given the deceased instructions to grease the crab.

For the defendants, Mr. F. Beverley said no instructions had been given the deceased to do any oiling when the machinery was in motion, and if the orders of the management were carried out the machinery was safe.

The magistrates fined the company £50, and also allowed five guineas special costs.

Lapish v. Braithwaite.

THIS matter came before the Lord Chancellor and Lords Atkinson, Buckmaster, Carson, and Blanesburgh, in the House of Lords on November 26th and 30th, on the appeal of the plaintiff, Mr. J. B. Lapish, from the verdict of the Court of Appeal reversing a judgment for £10 given in his favour by Mr. Justice Bailhache. The aim of the plaintiff and appellant was to establish the liability to penalties of Alderman A. Braithwaite, of Leeds, for having acted and voted as an alderman while certain companies with which he was connected had large contracts with the Leeds City Council.

After hearing Mr. Maugham, K.C., for the appellant and Sir John Simon, K.C., for the respondent, their Lordships reserved judgment.

The Postmaster-General v. Ford.

AT the Marlborough Police Court, on November 26th, Mr. R. M. Ford appeared on an adjourned summons for establishing, installing, and working a wireless station without a licence. Defendant pleaded "Not guilty," and after hearing the evidence, the magistrate (Mr. Mead) dismissed the charges of "establishing and installing" the station, and proceeded with that of "working" it.

The defendant said that the Act under which he was summoned did not define the term "message." He contended that musical performances could not be regarded as "messages."

The magistrate found the defendant guilty, and fined him £10 with £10 costs.

In response to defendant's request Mr. Mead agreed to state a case with a view to an appeal, and he gave defendant 14 days in which to pay the penalty, or, in default, he would be imprisoned in the second division for 11 days.

Holdway & Mardlin v. Capon.

IN the Whitechapel County Court, on November 20th, before Judge Cluer, Messrs. J. H. Holdway & Mardlin, electrical engineers, Enfield Wash, N., sued T. C. Capon, Hambury Street, E., to recover a balance of £15 for the wiring of seven lighting points, and an electric motor. There was a counterclaim for £4 for having the armatures of the electric motor rewound, and £2 15s. for extra work done.

Mr. HOLDWAY, in evidence, said that the work was completed in about three weeks, but he had only received £2. He denied that the wires were connected wrongly, or that there was any short circuit as the result of the way in which he had done the work. He also supplied an electric motor to the defendant and charged £8. It was in good condition, although second-hand.

The defendant said that plaintiff offered to do the work for £5 10s., but put in a bill for £17; no lamps or shades were supplied. A number of faults had developed; the armature of the motor was being rewound and would cost over £4, and various other items had to be supplied which the plaintiff had contracted to supply.

Judge CLUER said he thought that the plaintiff was entitled to a good deal more than he had been paid; £12 would be a reasonable figure. He would also allow £5 for the counterclaim.

Judgment was entered accordingly with costs.

Metropolitan-Vickers Electrical Co., Ltd., v. British Thomson-Houston Co., Ltd.

THE Court of Appeal, consisting of the Master of the Rolls and Lords Justices Warrington and Sargant, on November 26th delivered judgment upon the appeal of the plaintiffs in this case from the judgment of Mr. Justice Lawrence in the Chancery Division.

The plaintiffs, the owners of Letters Patent Nos. 9 to 44 of 1912, for an invention of "Improvements relating to Synchronous Dynamo-electric Machines," granted to Emanuel Rosenberg, brought the action for an injunction and the usual ancillary relief, alleging that the defendants had infringed the patent by the manufacture, sale and use of rotary converters constructed in accordance with the plaintiffs' specification. In particular the plantiffs complained of the sale towards the end of the year 1923 by the defendants to the West Hartlepool Corporation of two 300-kW rotary converters.

The defence was a denial of infringement and a plea that the plaintiffs' letters patent were invalid upon the ground of prior publication and prior general knowledge and that the plaintiff's patent was bad for want of subject matter.

Mr. Justice LAWRENCE, after hearing a mass of expert technical evidence, held that the plaintiffs' patent was bad for want of subject matter, and but for that invalidity the defendants would have been guilty of infringement. From this result the plaintiff company now appealed.

Lord Justice SARGANT read the judgment of the Court. He said the invention was for improved arrangements for starting a rotary converter. There were two alternative methods—the first and that to which the invention related was to use a separate starting motor fixed on the same shaft as the synchronous motor but actuated by some sort of power independent of the alternating current which was ultimately to be drawn from the main to actuate the rotary converter itself; the second method was to connect the synchronous motor or rotary converter to the mains either directly or through a reducing transformer and to permit it to start itself. That method had disadvantages. Having dealt at length with Rosenberg's specification and his claim and also with Tesla's publication in the United States in 1891, on which the defendants mainly relied in their plea of anticipation, the Lord Justice said that he thought that there was invention in what Rosenberg had done and on the view the Court took on his claim I the issue of infringement must almost necessarily be decided in the plaintiffs' favour. On the view which the Court had taken on the true construction of Rosenberg's claim the judgment of Mr. Justice Lawrence must be reversed with costs of the appeal and of the trial and the plaintiffs granted the injunction and the usual relief which was claimed in the statement of claim—the plaintiffs must elect whether they would have damages or an inquiry as to damages.

Counsel for the plaintiffs said they would ask for an inquiry as to damages.

Counsel for the defendants asked for a stay of the injunction if the defendants decided to appeal to the House of Lords.

The Master of the Rolls said that it was not the usual practice to grant a stay in order to facilitate an appeal to a higher Court.

In reply to the Master of the Rolls, Counsel for the plaintiffs said that his clients would be satisfied with an undertaking by the defendants to alter their machines in such a way that they would not infringe.

Dublin and Lucan Electric Railway Co., Ltd.

IN the High Court of Dublin, before Mr. Justice Johnston, last week, an application to adjourn the petition for the winding up of the Dublin & Lucan Electric Railway Co. for a fortnight was granted. It was stated that there were certain negotiations at present proceeding, which might save everybody a great deal of difficulty. Mr. H. J. Moloney, B.L., who appeared for the first debenture holders, said that a provisional liquidator had been appointed, and he was in charge of the assets. He would be in a better position at the end of a fortnight to say whether he would apply for a final winding-up order or not.

False Pretences Charge.

AT the Halifax Police Court, on November 26th, William Waters, electrician, was sentenced to three months' hard labour for obtaining money by false pretences. It was stated that he obtained 17s 6d. from a woman shopkeeper on the pretence that he came from the Halifax Corporation Electricity Department, offering to put in an electric lighting installation, six lights, for £4, the price being so low (he said) because the cable was already laid in the street. He secured a deposit for 10s. and later another of 5s. He asked for £1, but got only a further 2s. 6d. as the work was not completed. Three charges of similar frauds at Kirkstall, near Leeds, were taken into consideration. It was said that the man obtained Leeds Corporation electricity application forms and in the Halifax case crossed out "Leeds" and substituted "Halifax."

London Electric Supply Corporation Fined.

AT the Greenwich Police Court on November 30th, Mr. Dummett, the magistrate, gave his decision in the case reported in our last issue (p. 879), in which the London Electric Supply Corporation, Ltd., was summoned at the instance of H.M. Inspector of Factories for failing to adequately protect a transformer, the death of an employé resulting.

Mr. DUMMETT said that the terminals were not sufficiently protected, although the transformer was in a cage; some further, local, device was necessary. He imposed a fine of £5, with 15 guineas costs, in respect of the first summons, and the maximum penalty of £100 on the second. The company gave notice of appeal.

Parliamentary News.

(By Our Special Parliamentary Reporter.)

Directional Wireless.—On November 24th, Sir P. CUNLIFFE-LISTER informed Mr. Ramsden that a Committee was appointed on July 8th last to "advise the Board of Trade regarding the development in the United Kingdom of the service of wireless direction finding stations, wireless beacons and similar aids to navigation, and the location and types of such stations to be maintained." The Committee, which consisted of representatives of the Departments concerned and of the shipping industry, was a standing advisory committee dealing with concrete cases, and its conclusions or reports would not ordinarily be published.

Interference with Broadcasting.—On November 24th, Mr. DAY asked the Postmaster-General whether his attention had been drawn to the nuisance experienced by broadcast listeners owing to the interference of the Northolt G.P.O. wireless station, and whether this nuisance could be rectified.

SIR W. MITCHELL-THOMSON said that some interference with broadcast reception was caused by the Northolt station prior to November 7th, but, as the result of continuous experiment, the conditions had been much improved and the "broadcast" wavelengths were now practically clear of interference from that station.

Railway Stoppages.—On November 24th, Mr. CAMPBELL asked the Minister of Transport how many stoppages had taken place on the Underground Railways of London within the last three months owing to failure of current; whether these stoppages were becoming more numerous; and whether any remedial action could be recommended to the companies concerned to minimise the inconvenience to the public.

Colonel ASHLEY said he had brought this matter to the notice of the railway companies concerned, and was informed that no stoppages or delays owing to the failure or the temporary reduction of the current had occurred during the last three months on the Metropolitan Railway, and that there had been three such delays on the Metropolitan District and London Electric Railway Company's systems in all. Of these, one was due to circumstances of an exceptional nature, and the other two were attributable to an abnormal quantity of leaves in the river affecting the supply of condensing water. Works were already in progress to overcome this difficulty.

Low-Temperature Carbonisation.—On November 24th, Mr. SMITHERS asked the Secretary for Mines whether he could now inform the House what steps had been taken to make the low-temperature carbonisation of coal a commercial success.

Colonel LANE-FOX said that a great deal of research had been, and was being, undertaken at the Fuel Research Station, and an offer had been made to test free of charge plants which claimed to have solved the problem of low temperature carbonisation. Promising results had been obtained in a number of cases, but so far as he knew no plant had yet been working on a commercial scale for a long enough period to enable any definite judgment to be formed.

Rating of Machinery.—On November 26th, during the discussion on the report stage of the Rating and Valuation Bill, the House of Commons, in a "free" vote, by 324 to 106, agreed to the clause which unrates industrial machinery.

The Severn Scheme.—On November 26th, Colonel WOODCOCK asked the President of the Board of Trade how many reports had been made in connection with the Severn tidal-power scheme; if he was still satisfied that he was justified in continuing the expenses incurred in connection with the inquiry; and what was the total amount spent up to date and the total estimated cost of the inquiry.

SIR PHILIP CUNLIFFE-LISTER said that leaving out of account the report on tidal power of the late Water Power Resources Committee, which drew attention to the desirability of investigating the practicability of utilising the Severn tides for power purposes, two reports had been made by committees. The first of these dealt with the nature and probable cost of the necessary investigations; the second was concerned merely with the preliminary question whether it would be possible actually to erect a barrage in the Severn. The conclusions reached were such as to justify the continuation of the inquiry. The cost incurred to date was £2,597. The total cost of the complete inquiry had been estimated at from £70,000 to £90,000.

Amplifiers in Parliament.—On November 30th, Mr. WELLS asked the First Commissioner of Works whether, in view of the success which had attended the use of amplifiers in the House of Lords, he would consider the installation of similar apparatus in the House of Commons.

The Under-Secretary of the Home Department, who replied, said that the better acoustics of the House would not justify such an installation.

Broadcasting Parliament.—The question of broadcasting special debates or speeches was again raised by Mr. SMITHERS on November 30th, who said that there was a growing desire among the public to hear Parliamentary proceedings.

Major HENNESSY, replying for the Government, said that no decision could be taken on the subject until the general question of the future of broadcasting had been settled.

Correspondence.

***Correspondents should forward their communications* at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

To the Friends of "C. H. W."

Nearly a year ago the electrical community had a severe shock in the untimely death of Mr. C. H. Wordingham, whose end was undoubtedly hastened by his continuous efforts on behalf of various forms of activity in connection with the welfare of his profession, at a time when he should have been taking it easy after a previous illness. During the last few years of his life he spent a material proportion of his time in voluntary work, trying to help on movements connected with electricity, and by doing so he undoubtedly reduced his opportunity and capacity for earning and putting aside as much money as many men of his standing could do.

In view of these circumstances his widow, Mrs. Wordingham, has started a boarding and day school and holiday home for young children at the house "Beechwood" in Ridgeway Road, Redhill, at which many of his friends received hospitality in the past. Perhaps, therefore, some engineers and others connected with electricity, who have little growing "responsibilities," especially those who have work overseas, might care to bear in mind this school when a choice has to be made, or might put in a word with their friends for the same purpose.

Many men must miss the cheery word and old-fashioned doggedness of C.H.W., so perhaps some of them might see their way towards lending a hand to those he has left behind him.

Theodore Rich.

Westminster, *November 23rd*, 1925.

Assisted Wiring Schemes.

I have been very much interested in reading Mr. J. Edgar's paper on "Assisted Wiring Schemes," which he gave to the E.D.A. Conference in London last week, and am looking forward to the night when Mr. Edgar will give this lecture before the North-East Coast E.D.A. Conference.

First of all, I should like to compliment Mr. Edgar on his enterprise, and wish all engineers were as pushing in the advancement of the electrical industry.

I also read with great interest the discussion which took place after the paper was read, especially the views of Mr. L. G. Tate.

It has been thought that electrical contractors are antagonistic to supply engineers. This is not the case by any means, and electrical contractors are very anxious indeed to work harmoniously with the supply authorities' engineers, but they have to face a very grave danger, *not* from the engineers, but from the City and Borough Councils. The engineers generally are not Socialists, but we never know when the composition of a Council may change after an election, and the great dangers contractors have to face are the Socialistic policies of Councils.

Again, after satisfactory arrangements have been made with one engineer, that engineer, if he is an exceptionally capable and enterprising man like Mr. Edgar, is likely to advance and be appointed to a large authority. A different engineer may be appointed and the arrangements may not be so satisfactory.

If the Socialistic element is predominant on a Council and powers are given to the undertaking to trade, then the Socialists will soon see that all the work is done by direct labour.

I instance a town close to South Shields, namely, Gateshead. If, at the present time, the Gateshead Corporation was supplying electricity, everything would be done by direct labour. Fortunately, the supply is by private enterprise. The Gateshead Corporation is a Socialistic body, and practically all work is carried out by direct labour.

Again, we come to Mr. Edgar's neighbour, Sunderland. Here we have another phase, and a very serious one indeed, but it affects another branch of the industry, namely, the electrical wholesalers. In Sunderland, the Corporation Supply Department is having hired wiring work carried out by contractors, but is factoring the material itself, to the detriment of the wholesalers.

It is well known that the Socialist policy is to have all enterprises undertaken by the State or the Municipality, and I am quite certain that the ultimate aim of the Socialists, if they get into power, which they may do quite soon, will be to endeavour to take over the large power undertakings and for the State to supply in bulk and the Municipality to distribute and carry out all work in connection with the undertakings, right up to the lamps.

It is easily seen that this affects everyone in the industry, and it is admitted that private enterprise is responsible for the advancement of any industry, and wherever the State has undertaken a commercial venture, it has been unsuccessful.

I contend that it is up to every electrical man to do his utmost to encourage private enterprise and prevent the State or the Municipality trading to the detriment of the taxpayers or ratepayers.

It is interesting to note the great electrical development on the North-East Coast by that model of enterprise, the

Newcastle Electric Supply Co., Ltd., and its subsidiary undertakings. These undertakings are an example, not only to this country, but to the world.

I also contend that the municipal engineers and contractors should co-operate and see if some arrangements cannot be made so that they can work in harmony for the good of all and at the same time see that the contractors are protected against the Socialistic tendencies of municipal bodies. It is the Socialistic element of such bodies that the contractors are afraid of, and very much afraid of, and *not* the engineers, and I cannot understand how it is the engineers do not look at it in this light and realise the contractors' position. The contractors are as anxious as, if not more so than, the engineers for the advancement of the industry, and this cannot be attained by Socialistic methods, but success is assured if private enterprise is allowed full scope.

I should very much like to hear the views of other electrical men regarding this great and important question.

The whole matter affects general economic principles, and is of vital importance to the country at large.

R. E. Robson.

Newcastle-on-Tyne, *November 28th*, 1925.

Rural Electricity Supply.

It is not my intention to prolong the correspondence on this matter, and, as I stated in my last letter, I am not entering into the particular merits or demerits of the case in regard to overhead lines, but if Mr. Fennell has mis-stated his points in the same way as he has mispresented my last letter, then I can readily appreciate his making no headway. He appears to lash out at all who dare record any opinion in opposition to his own.

I would direct Mr. Fennell's attention again to my letter and ask him where I advocated compulsory application of the I.E.E. Rules, and also where I suggested "subsidy" as a remedy?

Mr. Fennell's cheap sneer at West Ham is unworthy of him, and as I stated, and would again repeat, such references only weaken his case.

Even although Mr. Fennell scorns "subsidy," which I have never suggested, he apparently asks for subsidy in another way by asking other authorities to bear an expense which is legally his own.

I venture to suggest that if he will confine his correspondence to arguments instead of abuse, he will find a greater acceptance, and I shall be glad to give him my co-operation in attempting to modify any irksome restrictions which retard progress.

Fredk. W. Purse,
Engineer and Manager.

Electricity Department,
West Ham, *November 23th*, 1925.

The Electro-deposition of Cadmium.

We are extremely interested in Mr. E. W. Lewis's very lucid article on "Electro-Deposition of Cadmium and its Alloys," but feel there are one or two points which require amplification in order to present the case a little more clearly to the average non-techical reader.

It may be accepted that the deposition from a cadmium ammonium sulphate bath is hardly commercial enough in its character to allow for widespread application.

The degradation of the peptone in the bath to amino acids necessitates the frequent filtration of the solution and the addition of further peptone, and since no indication is given in the colour of the deposit of the necessity of further additions, the ordinary working plater would be somewhat in the dark as to when to filter the bath and replenish with peptone.

From our experience the ideal solution is one made up of cadmium potassium cyanide, caustic soda, and various colloid additive agents. Such a solution will work continuously with small additions, say an occasional addition of potassium cyanide to maintain the minimum amount of free cyanide in the solution. The additive agents are not affected by electrolysis, being in a mildly alkaline solution, and the resulting deposit is of a silky texture of extremely fine grain which will take a very high polish.

We cannot agree with Mr. Lewis's contention that electro-deposited cadmium is more resistant to tarnishing than silver. Our experience has been that the sole objection to the metal is the rapidity with which it oxidises and so causes a black mark on any body coming in contact with it. A highly polished cadmium surface, if rubbed with the hand or with a clean duster, will give a black mark, and in view of the poisonous nature of the metal its general application for those purposes for which silver is at present preferred is restricted.

Another interesting point raised is the ease with which cadmium alloys with steel. According to the Udylite patent this can be accomplished at 250 deg. C., but we have found that it progressed quite easily in the cold, and a highly polished steel article which has been cadmium plated, shows every sign of the metal's having gone right through the surface of the steel, when the cadmium is removed by means which leave the original polish of the steel undimmed.

Regarding the deposition of cadmium alloys, this is not a commercial proposition at the present moment. The bath requires frequent analyses to maintain the balance of the two metals in it; also frequent analyses of the deposits are necessary to ascertain if the correct alloy is being deposited. In view of the fact that the ordinary working plater has no means whatever of judging from the colour of the deposited metal whether the correct amount of cadmium is present in the deposit or not, we feel that such a process is only applicable to those works which employ several chemists and have facilities for making frequent analyses both of the solution and deposited metal.

Birmingham, *November 25th*, 1925.

The Cost of Living in Bombay.

With regard to "Sales Engineer's" query in your issue of October 9th last, I may say that he will find the equivalent of £300 a year at home hopelessly inadequate in such an expensive city as Bombay is at present.

Taking the standard value of the £ sterling at fifteen rupees, his salary will be Rs. 375 per mensem; and the amount he will have to spend regularly at the end of each month will be as follows:—

	Rs.
Boarding house, chummery, or as a paying guest in a private household	250
Servant	35
Dhobi (washerman)	10
	295

This leaves him with a balance of 80 rupees to pay for clothes, amusement, club subscriptions, doctor's fees, &c., and his savings (save the mark) will invariably be an overdraft at the bank.

As I have been twenty years in India and most of that time has been spent in Bombay, I can certainly say that it is the most expensive city in India to live in, as I have had occasion to compare notes with friends in other parts of the country.

No single man who intends coming out here should do so under less than 550 Rs. per mensem; and a married man with two or three children should not attempt it under 1,200 Rs. (these are minimum figures). The rents of the houses in decent localities are prohibitive, and it is not unlikely that the prices will be still further increased when the rent control is abolished at the end of the coming year. Small flats are as rare as gold dust, and moderately sized ones cannot be obtained under 250 to 300 rupees per mensem.

Some optimists declare that the prices of commodities are coming down. If that is so, I can only say, as a married man, that the reduction is so small as to be almost negligible.

All those who propose coming to India should remember that they do not come out here for the benefit of their health, and if they are not to be compensated by a comparatively reasonable increase in salary which will enable them to save a little and allow them to indulge in a fair amount of sport, which is absolutely essential in such a trying climate, it would be far better if they remained at home, where their prospects of longevity will be greatly increased.

Free medical attendance is provided for their employés by Government, railways, and certain firms of standing, and they also have a pension or provident fund scheme. These are very important matters, and the prospective immigrant would be well advised to make inquiries regarding them before signing any agreement.

If any of your readers wanting further information on the subject will communicate with me, I shall be very glad to supply it.

Bombay-ite.

[On behalf of our readers who are interested in this subject, we thank our correspondent for his valuable information.

We shall be pleased to forward letters to him. Similar data from other parts of the Empire overseas would be welcome.—Eds. Elec. Rev.]

Salaries of Combustion Engineers.

I have read with considerable interest and astonishment Mr. Wade's letter regarding the salary of a combustion engineer as compared with that of a shift engineer.

I do not wish in any way to underestimate the value of combustion engineers, but as a shift engineer in charge of one of the largest and most modern generating stations in this country, I strongly object to my own rank being belittled.

I have always been of the opinion that a shift engineer worthy of such a name is also a combustion engineer, but combustion engineers are not shift engineers.

My experience in large power stations has also shown me that the combustion engineer is responsible to the shift engineer or charge engineer (which is the same thing), therefore why should he be paid more money than the person to whom he is directly responsible?

Combustion engineers are only necessary because the shift engineer has not the time to devote to this part of his plant and not because he (the shift engineer) is not capable of doing this work as Mr. Wade insinuates.

We have a combustion engineer, but I sign the coal sheet and am responsible for the efficiency of the station as well as the reliability and continuity of the supply.

Shift Engineer.

November 28th, 1925.

International Critical Tables.

THE National Research Council of the United States has contracted to publish the "International Critical Tables of Numerical Data of Physics, Chemistry and Technology." The work of compiling the tables was undertaken by the Council at the request of the International Union of Pure and Applied Chemistry, with the endorsement of the International Union of Pure and Applied Physics, and under the auspices of the International Research Council. The material contained in the tables has been collected and critically evaluated by some 300 co-operating experts, including chemists, physicists, and engineers of many countries. The editorial expenses have been contributed and the work of the co-operating experts is practically gratuitous. The whole undertaking represents a money value of at least $570,000, of which the returns from subscriptions will represent only a minor part. The scope of the material collected covers all the available information of value concerning the physical properties and numerical characteristics of pure substances and mixtures of definite composition, the important classes of industrial materials, many natural materials and products, and selected data for selected bodies or systems, such as the earth and its main physical sub-divisions and the solar and stellar systems. In addition to their wide scope, the tables will contain many novel features of arrangement; for example, in many cases it will be possible to ascertain readily what substance or material of a given kind has a maximum, a minimum, or a given value for any particular property. The principal language employed will be English; but much of the explanatory text, &c., will be given also in French, German, and Italian. The work will be issued in five volumes, and the editors are making every effort to compress the material which has been collected into the available 2,500 pages. All volumes will be bound in a uniform reinforced buckram binding, and will be delivered to all advance subscribers as issued, with packing and carriage charges prepaid. The work will be published at the price of $60 for the five-volume set; but until the appearance of Volume I (early in 1926), individuals who are members of a recognised scientific or technical society, and educational institutions, public libraries, government departments, research laboratories, and the libraries of industries, will have the right to subscribe at the rate of $35 for the set of volumes. Application should be made to the National Research Council, B and 21st Streets, Northwest, Washington, D.C., U.S.A., on forms provided.

Trade-mark Applications.

THE following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from November 18th:—

Condit. No. 459,269. Class 5. Wire. No. 460,614. Class 8. Radio telephonic and telegraphic receiving and transmitting apparatus.—Autoveyors, Ltd., 84, Victoria Street, S.W.1.

Superducon. No. 455,490. All goods in Class 8.—The Dubilier Condenser Co., Ltd.

Utix. No. 460,721. All goods in Class 8.—Ripaults, Ltd., 1, King's Road, St. Pancras, N.W.1.

Chaseway, No. 461,496. All goods in Class 8.—The Chase Electrical Manufacturing Co., Ltd. (in liquidation), 184, Fleet Street, E.C.4.

Enoni. B No. 461,830. Class 8. Instruments and apparatus, and parts thereof, for use in radio-telephony and telegraphy.—Osram Gesellschaft, 11-14, Ehrenbergstrasse, Berlin, O.17. (British representatives: Cruikshank & Fairweather, 65-67, Chancery Lane, W.C.1.)

Radiax (lettering and design). No. 462,951. Class 8. Apparatus and parts thereof for use in radio-telegraphy.—Radiax, Ltd., 4, Percy Street, W.1.

Maxel. No. 463,051. Class 8. Philosophical and scientific instruments and apparatus for useful purposes.—F. E. Pither, 38, Mortimer Street, W.1.

Objections against any of the following may be entered within one month from November 25th:—

Byfunken. No. 458,190. Class 8. Headphones for use in connection with radio-telegraphy and telephony.—H. Byford, 39, Charterhouse Chambers, Charterhouse Square, E.C.1.

Louden (lettering and design). No. 457,898. Class 8. Thermionic valves for use in radio-telephony.—Fellows Magneto Co., Ltd.

Etherac. No. 459,851. All goods in Class 8, except crystals and coils, for use in radio-telephony.—S. Guiterman & Co., Ltd., 35-36, Aldermanbury, E.C.2.

R.I., Ltd. (lettering and design). No. 461,207. Class 8. Instruments and apparatus for use in radio-telephony.—Radio Instruments, Ltd.

Vono. No. 462,215. All goods in Class 8.—E. Vaughan, Duport Foundry, Dudley Port, Staffs.

M.S.S., Ltd. (lettering and design). No. 462,378. Class 8. Philosophical and scientific instruments, and apparatus for useful purposes.—Mark Shaw and Sons, Ltd., Milnsbridge Ironworks, Huddersfield.

Beacon (lettering and design). No. 460,796. Class 13. Electric lamps (ordinary).—The Baybrook Electric Co., Ltd., 15-16, White Cross Place, Wilson Street, E.C.2.

Nerka. No. 463,011. Class 13. Sparking plugs.—La Société Nerka, 21, Rue Le Peletier, Paris (British representatives: Reginald W. Barker & Co., 56, Ludgate Hill, E.C.4.).

Electrolysis.—The Perth Corporation Tramway Committee is to repudiate liability in respect of a claim of £56 by the Post Office authorities for damages to their cables by electrolysis.

Published Specifications.

Compiled expressly for this journal by Patent Agents.
The name of the applicant's patent agent, if any, will be found on the printed specification.
The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

1924.

6,686. "Electric cables." British Insulated & Helsby Cables, Ltd., and G. H. Nisbett. December 15th, 1924. (241,628.)

11,554. "Means for breaking electric circuits." W. B. Whitney, E. B. Wedmore, and British Electrical & Allied Industries Research Association. May 9th, 1924. (242,318.)

16,129. "Telegraph typewriters." Kleinschmidt Electric Co. Inc. April 3rd, 1924. (231,815.)

18,437. "Illuminated advertising devices." S. Fisher and W. E. F. Fitzgerald. August 1st, 1924. (242,334.)

18,540. "Electric fuses." V. Hope. August 5th, 1924. (Cognate application 3,338/25.) (242,338.)

18,570. "Magnifying apparatus for telegraph signals and circuits associated therewith." J. H. M. Christensen. August 5th, 1924. (242,340.)

18,624. "Wireless telegraph and telephone aerials." C. S. Franklin. August 5th, 1924. (242,342.)

18,743. "Receivers, particularly of the loud-speaking type." S. E. Witt. August 6th, 1924. (242,350.)

18,744. "Receivers, particularly of the loud-speaking type." S. E. Witt. August 6th, 1924. (242,351.)

18,809. "Electric resistance elements, particularly for use with electric radiators." P. M. Edinborough and Metropolitan-Vickers Electrical Co., Ltd. August 7th, 1924. (242,353.)

18,817. "Electric protective systems." A. Reyrolle & Co., Ltd., H. W. Clothier, and R. W. Biles. August 7th, 1924. (242,354.)

18,818. "Electric protective systems." A. Reyrolle & Co., Ltd., and R. W. Biles. August 7th, 1924. (242,355.)

18,819. "Insulated electric cable joints." British Thomson-Houston Co., Ltd. (General Electric Co.). August 7th, 1924. (242,356.)

18,844. "Apparatus for the electric transmission of signals to a distance." Siemens & Halske Akt. Ges. August 8th, 1923. (220,323.)

19,078. "Acoustic devices." Western Electric Co., Ltd. (Western Electric Co. Inc.). August 11th, 1924. (Patent of addition not granted.) (242,362.)

19,422. "Voltage regulation of dynamo-electric machines." A. H. Railing and J. P. Huggard. August 16th, 1924. (242,368.)

20,054. "Testing systems for telephone circuits." Western Electric Co. Ltd. August 25th, 1923. (220,963.)

20,664. "Electrical reverse-current cut-out apparatus." M. J. Railing, C. C. Garrard, and W. Wilson. September 2nd, 1924. (242,381.)

20,859. "Magnetic structures and method of manufacture thereof." Western Electric Co., Ltd. (Western Electric Co. Inc.). September 4th, 1924. (Addition to 188,688.) (242,384.)

21,986. "Terminals or couplings for electric wires." Fuller's United Electric Works, Ltd., and A. P. Welch. September 17th, 1924. (242,391.)

22,576. "Apparatus for recording telephone conversations." A. E. O'dell (Telegraphon Akt. Ges.). September 24th, 1924. (242,396.)

22,818. "Electric switchboards." Switchgear & Cowans, Ltd., and G. H. Neep. September 27th, 1924. (242,398.)

23,846. "Electric lampholders." J. W. Wyatt and J. Kipling. April 17th, 1925. (242,408.)

24,773. "Electric switches." J. A. Crabtree. October 18th, 1924. (242,417.)

25,560. "Electrical condensers." Dubilier Condenser Co., Ltd. (formerly Dubilier Condenser Co. (1921), Ltd.). (H. R. Van Deventer). October 27th, 1924. (242,423.)

25,566. "Electrolytic condensers." Dubilier Condenser Co., Ltd. (formerly Dubilier Condenser Co. (1921), Ltd.) (H. R. Van Deventer). October 27th, 1924. (242,424.)

25,573. "Variable electric condensers." Dubilier Condenser Co., Ltd. (formerly Dubilier Condenser Co. (1921), Ltd.) (W. Dubilier). October 27th, 1924. (242,425.)

26,925. "Coated filaments for thermionic discharge tubes." General Electric Co., Ltd., and C. J. Smithells. November 11th, 1924. (242,438.)

26,945. "Electric heating device for beds, cars, and like locations." S. H. H. Barratt. November 11th, 1924. (242,439.)

27,328. "Shock-absorbing supports for thermionic valves." M.-L. Magneto Syndicate, Ltd., and F. R. F. Ramsay. November 15th, 1924. (242,443.)

28,430. "Switches and circuit arrangements for telephone systems." Siemens Bros. & Co., Ltd., and W. G. Patterson. November 27th, 1924. (Addition to 219,740.) (242,457.)

29,587. "Electrical heating elements." W. Guy-Pell. December 9th, 1924. (242,465.)

29,999. "Electromotor for refrigerating machines." B. Bischof and C. Haccius. December 13th, 1924. (Convention date not granted.) (227,096.)

1925.

1,288. "Electromagnetic percussive tool." N. Japolsky and M. Kostenko. January 16th, 1924. (227,849.)

3,155. "Headlights for motor-cars and the like." I. Cassan. February 7th, 1924. (228,904.)

3,351. "Holders for thermionic valves." S. W. Cole. February 6th, 1925. (242,486.)

4,077. "Systems of electrical distribution." British Thomson-Houston Co., Ltd. March 14th, 1924. (230,805.)

4,810. "Combined plug-and-socket devices for electrical services." Santon, Ltd., and H. C. Sanders. February 21st, 1925. (242,495.)

6,189. "Coilholders for use in connection with wireless or other electrical apparatus." E. Wainwright and H. A. L. Machen. March 6th, 1925. (242,500.)

7,220. "Electric service boxes." Callender's Cable & Construction Co., Ltd., and W. J. Howard. March 17th, 1925. (242,509.)

9,556. "High-tension circuit-breaker." N. Japolsky. May 14th, 1924. (234,067.)

12,512. "Thermionic valves." J. Hawadier. May 26th, 1924. (234,480.)

14,179. "Method of and means for frequency transformation in electrical phenomena." C. Lorenz Akt. Ges. June 7th, 1924. (235,185.)

14,473. "Moulded electrically-insulating bodies having projecting ribs or screens." International General Electric Co. Inc. June 3rd, 1924. (235,196.)

14,346. "Electric switches." British Thomson-Houston Co., Ltd. June 3rd, 1924. (235,188.)

15,023. "Construction of the cabs of electric locomotives." Soc. Anon. des Ateliers de Secheron. July 8th, 1924. (236,908.)

15,596. "Electric magnetos." International General Electric Co. Inc. June 16th, 1924. (235,603.)

15,738. "X-ray tubes." Naamlooze Vennpotschap Philips Gloeilampenfabrieken. June 18th, 1924. (235,892.)

16,666. "Electromagnetic talking machines." Vox Maschinen Akt. Ges. June 28th, 1924. (236,237.)

17,029. "Controlling devices for electromagnetic talking machines." Telegraphie Ges. System Stille. July 3rd, 1924. (236,571.)

17,030. "Magnet carriers for electromagnetic talking machines." Telegraphie Ges. System Stille. July 3rd, 1924. (236,572.)

17,135. "Electric transformers." British Thomson-Houston Co., Ltd. December 31st, 1924. (241,843.)

17,365. "Portable electric lamps." Benjamin Electric, Ltd. July 5th, 1924. (236,595.)

18,982. "Electric hand-irons." O. Graetzer. December 1st, 1924. (242,565.)

23,423. "Automobile lamps." G. O. J. P. Christiansen. September 20th, 1924. (240,181.)

The

Electrical Review

VOL. XCVII. DECEMBER 11, 1925. No. 2,507.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE, M.I.E.E. A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address: "AGEEKAY, CENT., LONDON," Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d.; Colonial and Foreign, £2 1s. 6d. per annum Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

The All-Electric House.

THE Institution of Electrical Engineers is to be congratulated upon the paper which was presented to it by Dr. S. Parker Smith on Thursday last week. That the subject was of general interest was attested by the large attendance of members, and the only regrettable circumstance was the curtailment of the discussion, which promised to be more than ordinarily instructive. It is a long time since an I.E.E. discussion was adjourned, or since any complaint was raised to the effect that it was too brief, but on this occasion that opinion has been expressed to us not only privately but also by way of our "Correspondence" columns. It is an old-standing difficulty—shall the Elder Brothers of the fraternity dine first and meet at 8 o'clock, or meet at 6 and dine at 8? That the latter alternative is less objectionable to the majority of the members who attend the meetings seems clear, for the Council took an informal vote on the matter by post-card some years ago, and did not subsequently change the hour from 6 o'clock. It is significant of the feeling amongst the Younger Brothers that at the Informal Meetings, which commence at 7 o'clock, the discussion goes on till half-past nine, suggesting that the members concerned think less about dinner than about the debate.

It is seldom that so good a paper is submitted, and therefore all the more regrettable that it was not fully discussed. Readers of it may demur to its contents on the grounds that the electrical equipment of the house was super-normal, that the admirable tariff of the Glasgow Corporation is not paralleled in many towns, and that the capital outlay was not stated. But the data are given in full and can be made the basis of deductions with regard to differing conditions, and we trust that Dr. Parker Smith will give further particulars about the cost of his installation. Incidentally, it was interesting to note that he used cab-tire-sheathed cable throughout.

It is true that the author treats the all-electric house as a whole, and including the cost of the extra wiring and the electrical apparatus permanently installed, estimates that the total cost of the house was 3 or 4 per cent. more than that of a house equipped with ordinary coal and gas appliances and electricity for lighting only. So far as a new house is concerned, this is a per-

fectly sound basis of comparison, for when one is building a house, one does not take out the cost of the gas-piping and electric wiring separately—they are integral parts of the house, like the water-pipes. Moreover, as he points out, and as the Electrical Development Association proved long ago, a house designed for electric heating can be built and equipped with the necessary apparatus more cheaply than one designed for coal fires. This is a fact which ought to be effectively impressed upon builders and architects, especially in areas where electricity is available on a reasonable tariff. But if someone would furnish reliable data for the cost of fitting an existing house with electric heating and cooking equipment, using alternative systems of wiring, the information would be useful to many people.

As an example of thoroughness in the adoption of electrical methods, the paper is unique, for the author does not merely use all manner of electrical appliances—he has studied them in detail and puts forward a standard of efficient practice which deserves close study. The installation of separate meters for the different services afforded a means of obtaining valuable information regarding the consumption; it will be seen that heating, including water heating, accounted for four-fifths of the total consumption, and three-quarters of the total cost.

It would appear, therefore, that complete electrical heating is commercially practicable only where a very favourable tariff is offered, as the author clearly implied in his remarks at the Institution. It is true that he stated that the total cost was practically the same as he had experienced in a similar house using coal, gas, and electricity, with less return for the outlay; true, too, as he says, that few householders really know what they are paying for lighting and heating by gas and coal, to say nothing of the consequential expense for labour, re-decoration, &c., and we may add that the adoption of electrical methods generally implies the simultaneous adoption of a much higher standard of lighting and heating, though the user may not be fully conscious of the fact. But it is clear that electrical men will do well to restrain their enthusiasm when advising new consumers, particularly with regard to the continuous heating of rooms and water heating, lest they create too optimistic an impression in the first instance which will be rudely dispelled by the heating bills.

The North Wales Dam Accident.

The report of the inquest on the victims of the wash-out at Lake Eigiau, which we print elsewhere in this issue, leaves little doubt as to the facts of this lamentable occurrence. The concrete wall of the dam was founded on clay, into which it should have been carried to a depth of 6 feet; but at the part where the water broke through beneath the wall, the trench was probably only 1½ feet deep. During the past summer, which was exceptionally dry, the clay was exposed and may have been partially dried and fissured, permitting the returning water to percolate beneath the wall. The head of water was not great, and had the dam been carried down to the specified depth it might well have stood for a century; the concrete was admittedly of poor quality, permitting leaks which necessitated repeated attention, but these had nothing to do with the failure of the foundation, and the fact that the wall over the breach, 60 ft. in length, stood without support for many days before it collapsed suggests that it was of ample strength for the purpose.

The responsibility, then, rests primarily upon the head of the official whose duty it was to see that the plans were duly carried out—believed to be a Mr. Wilson, who is now dead—and secondarily upon the consulting engineers who supervised the work. But most unfortunately it happened that when the section of the dam where the failure occurred was built, the work was stopped, and remained suspended for two years; that section was neither certified nor paid for, and when the work was resumed from the point where the original contractors had left off, another firm of engineers was in charge of it.

It appears that the circumstances were altogether exceptional, and it is unlikely that any similar instance will ever be met with. The jury recommended that dams should be made subject to Government inspection, but whether the defect in the Eigiau dam would have been discovered by this means is very doubtful. As a rule, the engineers in charge of such work, having their reputations at stake, may be trusted to take every possible precaution to ensure the safety of the structure, and we cannot doubt that if the work on the Eigiau dam had followed the normal course the faulty section would have been detected and rebuilt at the time. The moral of the accident seems to be that continual inspection by an expert supervisor is indispensable.

While we doubt the efficacy of Government inspection during construction, there is much to be said in favour of an official inquiry in case of failure, such as those held by the Board of Trade in connection with boiler explosions and railway accidents, and it is probable that the question of instituting machinery for the purpose will be seriously considered.

Modern Electric Cookers.

In following closely the developments which are being introduced into the design and construction of electric cookers, an article on which has been appearing in our columns and is concluded in this issue, it appears to us that the greater part of the attention of the manufacturers is being directed to the demand of the supply engineer for apparatus calling for less maintenance than has been the case in the past, and in which repairs may be effected with a minimum of time spent on the consumer's premises; these requirements refer almost entirely to the hob plate elements.

To meet the first need, the enclosed boiling plate is being advocated, and it is generally assumed that by adding to the protection of the elements in this manner, the efficiency of the plate from the point of view of energy consumption is appreciably reduced. It would be interesting to know exactly how far the user gains or loses in the overall efficiency; few data are available, and it seems that the whole question is still in the "matter of opinion" stage. We hope that it will soon be possible to lay down definitely how far protection may be given to the elements without the overall efficiency of the cooker suffering in consequence. The figures given by Dr. Parker Smith in his I.E.E. paper for the efficiency of boiling rings were rather startling, and call for explanation.

With regard to the consideration of effecting repairs on the premises, there is a tendency to construct the elements in unit form so that the whole may be replaced "on the spot," and the defect repaired in the workshop. It is noticeable that in some designs this practice results in the actual elements being inaccessible. We think that the ideal unit would be an interchangeable one, in which the element spirals or bars and the connections were easy to examine and replace.

Germany and International Co-operation.

A good deal of hard thinking is taking place in Germany regarding the future of international trading. What is more natural, considering the need of capital and all the consequences thereby entailed? But while hard thinking as the outcome of anxiety is to be expected, it is unaccompanied by boastful bombast heralding schemes for world expansion such as we heard so often in the old days, and will not be objected to by the most suspecting Britisher. Yet the situation as it develops will require careful attention.

At the annual conference of the Central Verband der Elektrotechnischen Industrie last month, in Berlin, Dr. Carl Fr. von Siemens, the president, portrayed the economic future in very gloomy colours, and a later speaker, a former Minister of the Reich, indicated combination of works producing the same classes of articles as the direction in which salvation lay. It is anticipated, for example, that if the big Westphalian iron and steel trust becomes effective there will be, with an output of 6,000,000 tons of steel, an economy of £2,000,000 in the cost of keeping stocks. This, however, indicates no

material departure from the procedure which used to be characteristic of German organisation; it is periodically examined and advocated here with special reference to particular lines of electrical manufacture, and it has been practised on a small scale by British firms.

But the discussion at the Central Union went further than to deal with internal re-organisation; it included the subject of international economic co-operation. Dr. Meinhardt, of the Osram Company, prepared his hearers by remarking that new times required new ways, such as a combination extending beyond the German frontiers. While German electrical exports were not unfavourable, this section of outside trade was not doing well when compared with the pre-war period, and what it desired was to secure its share in the requirements of the world. International understanding had been the aim of the electric lamp makers, and he found everywhere abroad a disposition for international co-operation, in which the lamp agreement of 1924 had shown the way to other industries. Dr. Meinhardt went on to say that price-fixing for the world did not form part of that agreement, the organisation in each country being left to regulate prices for itself. The lamp combination allowed them to hope that in a short time that branch of industry would be able to substitute a serviceable and uniform pattern for the confused mass of types and sizes. The experience of a year's working of the agreement had been that the German factories were able to supply their customers at prices which were less than 70 per cent. of the pre-war price.

We may quote one other speaker—Herr Deutsch, of the A.E.G., who likewise advocated a horizontal construction of German industry. He was not in favour of syndicates which would have a price-increasing effect, but he desired to see a complete combination of similar kinds of works in a new company. In the first place, the combination should be of a German national character; secondly, it should be extended so as to be of European scope; and, thirdly, become international by the inclusion of the United States, thus bringing in the world markets. When such a stage had been reached it would not be possible to set aside the next problem of the question of the United States of Europe, which would be regulated both politically and economically. Herr Dutsch finally went so far as to express the opinion that the question of horizontal combination with the abolition of Customs duties and the creation of the United States of Europe, would come into prominence in the next ten years.

The Internal Combustion Boiler.

The mystery of Mr. Oscar Brunler's boiler efficiency is not in any way elucidated by his recent paper before the Institute of Marine Engineers. This boiler, as our readers will remember, consists of a vessel in which steam is generated by a flame burning in actual contact with the water. Oil is used as fuel, and the air for combustion has, of course, to be supplied to the flame at a pressure somewhat higher than the steam pressure in the boiler. The products of combustion and the steam generated leave the boiler as a mixture of which slightly less than half is steam, the remainder being incondensable gases. So far as the utilisation of this steam-gas mixture is concerned, the inventor appears to realise that any engine or turbine employed would have to exhaust at atmospheric pressure because of the practical impossibility of maintaining a vacuum, but this fact is regarded as of minor importance. Practical considerations, however, may be neglected for the moment in view of Mr. Brunler's reiterated claim for net efficiencies of over 100 per cent. for his apparatus. He gives "data" of tests which have been carried out during the past months by different authorities," purporting to show an efficiency of 109 per cent. with an unlagged boiler, but does not give the names of the "authorities" who arrived at so remarkable a result. He "could add a series of test figures showing efficiencies from 95 per cent. to 120 per cent.," and his faith in such figures is shown by his statement that "when facts and theories clash it is best to discard theory." With this pronouncement we cordially agree, but we would suggest that before discarding theory, Mr. Brunler should make allowance for the power absorbed in compressing the whole of the combustion air to 120 lb. per sq. in. before forcing it into the boiler, a little point which seems to have been overlooked, in the case of the test quoted.

Until we have a test of the boiler carried out by some authority whose name will inspire confidence, it is useless to follow Mr. Brunler into his theories as to how efficiencies of more than 100 per cent. can be explained. We can only agree that "time and science which never stand still will bring the solution of this phenomenon," though we think the solution, when found, will turn out to be something much more prosaic than Mr. Brunler anticipates. The boiler, however, has other properties almost as remarkable as its efficiency. "Only a few weeks ago," the paper states, "we ran boiler trials with feed-water which was mixed with 150 lb. of lime per ton of water, and after more than a week's run the boiler was inspected and the plates were perfectly clean and free from any incrustation." It would appear, from other portions of the paper, that this boiler was 3 ft. in diameter by 4 ft. 8 in. high, with a maximum capacity of 11,000 lb. of steam-gas mixture per hour. Supposing the boiler to have been worked for only 50 hours during the week, at an average steaming rate of only 3,000 lb. of steam per hour, the 150,000 lb. of feed-water would carry nearly 4½ tons of lime into the interior. One would have thought that this would have been enough to make a perceptible deposit in so tiny a boiler, but where the lime went is one of the mysteries which we must leave "time and science" to explain. The blow-down cocks may have been working overtime.

Electricity Supply in Rural Areas.

The fifth annual report of the Electricity Commissioners confirms our own frequently-expressed opinion with regard to "the demand which has been shown to exist" in rural areas. The words quoted above are derived from paragraph 19, page 10, of the Report. The North Somerset Electric Supply Co., Ltd., appears to share this view, and is giving practical effect to it, for Parliament last week confirmed the North Somerset Electricity (Extension) Special Order, 1925. The company therefore now holds statutory powers over the following areas*:—The City of Wells; the Borough of Glastonbury; the Urban Districts of Clevedon, Highbridge, Midsomer Norton, Portishead, Radstock, and Shepton Mallet; the Rural Districts of Axbridge, Clutton, Long Ashton, and Wells (except three parishes); twelve parishes in Shepton Mallet, R.D., six in Frome R.D., one in Bath R.D., and one in Keynsham R.D.

We understand that the scheme of distribution for this area, which includes approximately 450 square miles (288,000 acres), will cost well over a quarter of a million sterling, and we congratulate the company on its not adopting the "wait and see" policy. We should like to see other undertakers quoting their statutory areas (for general supplies) in acres or square miles. It is to be regretted that this information was not included in the Electricity Commissioners' Return of Electricity Supply Undertakings. It is very instructive to compare the extent of operations in different parts of the country, and by means of acreage one can obtain a fairly good idea of the relative sizes of territory. For instance, it is easily found without the aid of a map that the territory of the North Somerset Electric Supply Co., Ltd., is more than one quarter of the whole county, and indeed it covers more than one quarter of the area of the East Midlands Electricity District.

The engineering proposals of the company are based upon the taking of a bulk supply from the Corporation of Bristol, and embody a general scheme of rural development for the supply of electricity over a large area to a number of small towns and villages.

---

*See map on page 925.

Electricity Supply in Great Britain.—VII.*

Dorset and Somerset.

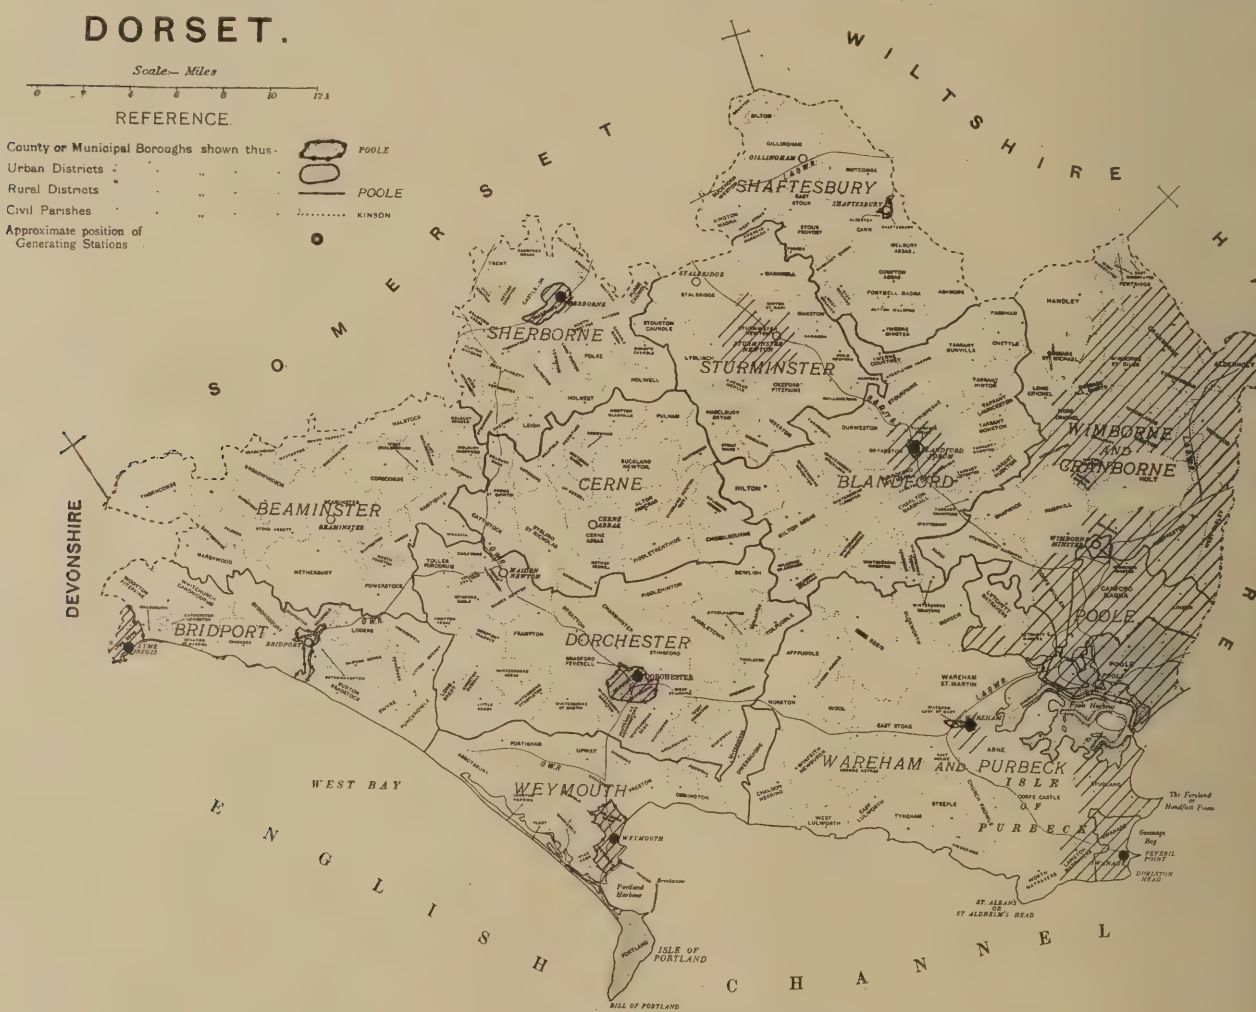
STATUTORY powers for the supply of electricity have either been granted or applied for in respect of the hatched areas on the maps here reproduced.

A large portion of Somerset is included in the Lower Severn Electricity District as provisionally determined by the Electricity Commissioners, but Dorset does not yet form part of an Electricity District.

In the list of authorised undertakers given below (whose areas of supply are wholly or partly in either Dorset or Somerset) it will be seen that there are no Power Companies.

Local Authorities.

Bath Corporation.
Bristol Corporation.
Dorchester Corporation.
Lyme Regis Corporation.
Taunton Corporation.
Weymouth Corporation.



The Shepton Mallet Gas Company (Electric Lighting) Act, 1905, was revoked in July, 1924, in so far as it relates to the supply of electricity, but the area concerned remains hatched as it was immediately applied for by the North Somerset Electric Supply Company, Ltd., whose Special Order has now been confirmed.

The 1921 Census gives the following particulars for the Administrative Counties of Dorset and Somerset and the associated County Borough:—

Acres.	Persons.	Resident families.	Buildings not containing dwellings.
1,663,206	693,870	166,568	11,479

These maps were prepared for the 1917 Boundary Commission, and are used here by permission of the Controller of H.M. Stationery Office. They are obtainable from Messrs. Edward Stanford, Ltd., price 6d. The following alterations have taken place since 1917:—

(1) The name of the Parish of Road is now spelled Rode.
(2) The Urban District of Burnham has been re-named Burnham-on-Sea.

Electricity Supply in the County of Dorset.

Companies.

Blandford Forum & District Electy. Supply Co., Ltd.
Bournemouth and Poole Electricity Supply Co., Ltd.
Bridgwater Dist. Elec. Supply & Traction Co., Ltd.
Burnham and District Electric Supply Co., Ltd.
Edmundson's Electricity Corporation, Ltd.
Mid-Somerset Electric Supply Co., Ltd.
Minehead Electric Supply Co., Ltd.
North Somerset Electric Supply Co., Ltd.
Sherborne Electric Supply Co., Ltd.
Swanage Gas and Electricity Co.
Wareham Electric Supply Co., Ltd.
Weston-super-Mare & District Elec. Supply Co., Ltd.
Yeovil Electric Light and Power Co., Ltd.

(3) The Parish of Melcombe Regis has been merged into the Parish of Weymouth, which is now co-extensive with the Borough of Weymouth.

(4) Part of the Parish of Easton-in-Gordano has been added to the County Borough and Parish of Bristol.

(5) Part of the Parish of Colehill has been added to the Urban District and Parish of Wimborne Minster.

(6) The Parish of Alcester and part of the Parish of Cann have been added to the Borough and Parish of Shaftesbury.

(7) Parts of the Parishes of Bishop's Hull Without, St. James Without, St. Mary Magdalen Without, Trull, and West Monkton have been added to the Borough of Taunton. The added parts have been amalgamated with the Parishes of Bishop's Hull Within, St. James Within, St. Mary Magdalen Within, and Wilton to form the Parish of Taunton, co-extensive with the Borough.

(8) Part of the Parish of Symondsbury has been added to the Borough and Parish of Bridport.

* Parts I-VI of this series appeared in the ELECTRICAL REVIEW of October 9th, 16th, 23rd, and 30th, and November 13th and 20th, 1925.

Electrical Progress in India.

Lines of Future Development.

(By An INDIAN ELECTRICAL ENGINEER.)

IT is a characteristic of India, in common with other Eastern countries, that it offers ample scope for the modern to flourish side by side with all that stands for the ancient. On the roads the Rolls-Royce flits past the palanquin; in the home the electric lamp outshines, but has not ousted, the old-time oil lamp. Thus we find, in a country industrially one of the most backward, a remarkable development in certain branches of electrical engineering. When completed in the early part of this century, the Sivasamudram (Mysore) hydro-electric scheme ranked as the biggest venture of the kind in the British Empire. It was the more remarkable in view of the fact that the supply was transmitted over a distance of 92 miles to Kolar Gold Fields. At the present time the biggest hydro-electric project ever handled by a British firm is the one for the Bhira station of the Tata Power Co. The plant consists of five sets, each consisting of twin Pelton wheels of 15,000 h.p., driving an 11,000-V, 21,900-kVA alternator.

Electricity Supply in the County of Somerset (*See p. 924*).

IT is a characteristic of India, in common with other Eastern countries, that it offers ample scope for the modern to flourish side by side with all that stands for the ancient. On the roads the Rolls-Royce flits past the palanquin; in the home the electric lamp outshines, but has not ousted, the old-time oil lamp. Thus we find, in a country industrially one of the most backward, a remarkable development in certain branches of electrical engineering. When completed in the early part of this century, the Sivasamudram (Mysore) hydro-electric scheme ranked as the biggest venture of the kind in the British Empire. It was the more remarkable in view of the fact that the supply was transmitted over a distance of 92 miles to Kolar Gold Fields. At the present time the biggest hydro-electric project ever handled by a British firm is the one for the Bhira station of the Tata Power Co. The plant consists of five sets, each consisting of twin Pelton wheels of 15,000 h.p., driving an 11,000-V, 21,900-kVA alternator.

The Hydro-Electric Possibilities.

The hydro-electric resources of the country were systematically explored by Mr. J. W. Meares, M.I.E.E., and his Commission, the report of which is well known to electrical engineers in this country. As is pointed out in this report, it is regrettable that the sources of hydro-electric power are in many cases located far from centres of industry. Hence development of this power must be slow unless the Government of India adopts the bold policy of making energy available in anticipation of demand. While there are grave risks attached to such a course, it is well known that in India, as in other places, the availability of cheap electric power not only fosters old industries, but often gives rise to new ones. A case in point is that of the Sivasamudram scheme, which in its initial stages depended entirely upon the Kolar Gold Fields for its load, but now supplies the greater part of its output to other industries, some of them entirely new, in Bangalore and Mysore. The case of Bombay is somewhat similar, *mutatis mutandis*, to that of Bangalore, it being generally agreed that the cotton industry there has been revolutionised by the advent of hydro-electric power supply. The first Tata hydro-electric scheme was completed in 1912; it was followed by the Andhra Valley and other Tata power schemes, the aggregate power available amounting to about a quarter of a million kW. Combined with cheap labour, the new source of power supply has been an important factor in the competition that the mills of Bombay are offering to those of Lancashire.

A number of schemes are in course of development in various parts of India at the present time. In the Western Ghats, near Bombay, as well as further south in Malabar and Cochin, surveyors are busy. Mysore is turning her attention to the harnessing of the famous 1,000-ft. Gersoppa Falls with a view to utilising them for electro-metallurgical and other purposes. In North India, the Punjab is the centre of interest from the point of view of hydro-electric resources.

Electric Traction Developments.

The Great Indian Peninsula Railway, admittedly one of the most efficient lines in the country, gave the lead in the matter of electrification. The first stage, now nearing completion, is mainly intended for urban service. A much larger scheme, involving the electrifi-

cation of 300 miles of main line, is now under consideration. The B.B. and C.I. Railway, another of the lines converging into Bombay, has electrification plans in view, while many other railways, notably the B.N. Railway and the S.I. Railway, in Bengal and Madras respectively, have ambitious schemes of their own. As regards the tramways, in many of the greater towns only the question of finance stands in the way of carrying out urgently-needed extensions. The tramway has also a great scope in the moderate-sized towns, of which so many are still without any organised public conveyance service. In certain congested areas of Bombay and Calcutta there would appear to be some scope for the railless electric 'bus in view of its greater flexibility. Progress in the application of electric battery trucks is very encouraging, particularly at harbours and railway termini.

Power Supply in Small Towns.

A field in which great possibilities exist is that of electricity supply in the smaller towns both for lighting and power purposes. In view of the fact that the development of hydro-electric power all over India must take a considerable period, and that many of these towns are even now ready to become consumers of electric power, it is clear that the small generating plant has ample scope in India. There are, of course, some obstacles to be overcome, such as the conservatism of the people and the ignorance of local authorities with regard to electrical matters. But there is consolation in the fact that there is no well-established competitor like a heavily-capitalised gas industry to impede the progress of electrical development.

Small industries connected with agricultural products, such as oil and rice mills, and tea- and coffee-curing works, are a feature of the economic life of India. There has been no serious attempt made as yet to introduce electricity into these, which, be it noted, are scattered over the country often at great distances from the large cities. The advent of electricity in the small town will bring electricity supply nearer to these industries. The problem is very complex and beset with many difficulties, but, if successfully tackled, would yield much fruit. With regard to the demand for electricity for such domestic uses as cooking, heating, &c., there is not anything like the scope which exists in Western countries. The principal consumers would be the large hotels and the more up-to-date bakeries, and these would by themselves constitute a class worthy of consideration.

A Few Remarks on Selling.

By "SALES MANAGER."

MUCH has recently been written on the question of selling, and naturally it is a question of such magnitude that it would be impossible to treat the subject fully in a short article of this description. I propose, however to deal generally with the question on the lines of a salesman's worth, and methods generally adopted in connection with sales, not from the point of view of selling over the counter, but more especially in connection with plant.

Before proceeding on the lines mentioned above, I would draw the reader's attention to an article appearing in this journal on November 20th, headed "When Salesmen Sell the Business," from which the writer appeared to imply that a sales organisation from the sales manager down, simply thought of nothing else but turnover at any cost, having no regard to the balance-sheet, whereas I can assure "Cost Consultant" that the selling organisation, although realising that a turnover must be obtained, also realises that the turnover must show a profit; if it does not, then there will soon be a new selling staff, or at least a new sales manager.

From a broad aspect, and to suit the purpose of this article, I will divide a manufacturing business into two departments, referring to them as production and selling, as it would take far too much space to deal with all the various departments which are necessary in a concern to keep production and selling functioning in an efficient manner. In any case I think it will be agreed that there are two essentials in a manufacturing concern, *viz.*, to produce the article and to sell it.

At this point there are two further aspects to be taken into consideration: (1) Is there a market for which we have to find an article? or (2) Is there an article for which we have to find a market? Probably if we went back many, many years, we might say to the commencement of selling, then we should have to admit that it was in practically all cases a question of creating the market, but to-day we must consider both aspects, although it is difficult to draw an actual dividing line. As an example, I would quote that there is a market for electric lamps, irons, transformers, &c., and the articles are being produced—on the other hand, when a turbine was first produced, there was no market for it, for the simple reason that the reciprocating engine had been more or less perfected, whereas the turbine was far from perfection. Probably at some period all things could be treated on the same level, *viz.*, from the point of view of creating the market, but I have taken these two cases to show that the salesman who has to create his market must possess a far greater imagination and be a far better salesman than the man who has his market already made for him, for, in the first case, the man has to see the possibilities of the imperfected article, which I think everyone will agree is extremely difficult. Now, where the article is perfected and the salesman simply has to sell in ordinary competition, he need not possess the same qualifications. Where one has to sell practically identical articles at the same price, which is often the case to-day, then the personality of the salesman is the chief consideration.

Viewing the question from these two points, I think everyone will agree that where one has to create the market and sell, as against purely selling, then the former is by far the more difficult problem; consequently any man possessing the qualifications, or I think I might say gift of being able to create the market, and also to sell at a profit, is worth far, far more than the salesman who merely sells a standard article in competition.

I do not wish to imply that it is an easy matter to sell a standard article in competition, as I know from experience it is a difficult matter, but simply to point out that the man who can create the market and sell at a profit is not only of tremendous value to a concern, but is surely a super-salesman.

Passing to the question of methods generally adopted in connection with sales, we all realise, of course, that the percentage of importance of production and selling is "fifty-fifty." It is, therefore, essential for the efficient working of a concern that the general manager be absolutely unbiased, for if he is 70 per cent. production and 30 per cent. sales, or *vice versa*, then the concern must suffer. Some of us may wonder why a general manager's salary is so much more than that of the sales manager or the works manager, but if we consider the matter for a moment, the answer is obvious, for, to be a successful general manager, the qualifica-

tions of works and sales manager must be combined fifty-fifty. "Cost Consultant" recently referred in these columns to the question of final price-fixing being left, more or less, to the sales manager, irrespective of profit or loss. If final price-fixing is left to the sales manager, then the concern is asking for trouble, for it is obvious from previous statements that final price fixing is purely a matter for the general manager (or someone representing him), not for the man responsible for production or selling—otherwise the production man would simply say at the end of the year, if the balance-sheet showed a loss: "Sell at higher prices," whereas the selling man would say: "Produce at less cost," and where would the general manager be when called upon by the board to give an explanation? Would it not be a question of the resignation of the general manger, for the simple reason that he was obviously incapable of holding the position, if the foregoing situation arose?

Now we come to the correct method of deciding prices, and as we are reckoning that we have to create the market; we have little or no guidance as to selling price—the main responsibility again devolves on the general manager, and he must be satisfied that the article is being produced at the best possible figure; he has, of course, all costs tabulated as regards works, overhead, &c.; then he gathers from the sales manager the probable cost of this department, and arrives at the selling price. By this means, if normal profit is not being made, assuming the turnover is being maintained, it is up to the general manager to decide as to whether the production costs are too high, or the selling prices too low, and then take the necessary action to correct the conditions which exist.

Where the market already exists, prices are more or less established, the bulk of the orders going to the concern with the best selling organisation. It has been said that we are a nation of shopkeepers; perhaps we are, but then most things revolve round buying and selling.

Modern Electric Cookers.

A Review of the Recent Improvements in Electric Cooking Stoves.

(*Concluded from page* 846.)

An unusual method of housing the oven elements has been adopted by the General Electric Co., Ltd., in its recent production, the H5670 model, fig. 16. As in other designs of cookers by this firm, the elements are arranged for heating from the sides. They are made up in unit form in a rectangular frame, which is lowered vertically into a chamber between the shell and the lining at each side of the oven. The top of the frame or element unit is accessible after the hinged hob plate is lifted, and consists of a flat plate, which acts as a terminal board and secures

Fig. 16.—"Drop-in" Oven Elements.

the frame in the chamber. Fireclay bars, on which the nichrome element spirals are wound, are placed horizontally across the lower end of the frame, and rigid bar connections are employed from these to the terminals. The bars are easily removable from the frame, out of position, by releasing two bolts and wing nuts on each. The overall dimensions of this cooker are 25½ in. by 18½ in. by 15½ in. In another G.E.C. model, H5700, the element bars are attached to fixed rigid connecting rods. The oven, boiling and grilling-plate elements are separately fused and controlled. The clear oven cooking space is 14 in. high, 16 in. wide, and 16 in. deep. The full oven consumption is 2,400 W and the total loading for the stove is 8,000 W.

While it seems to be the general practice to install top and bottom oven elements with unequal loadings, it is interesting to learn that in the latest "Cosmos" cooker the makers have provided similar elements with equal capacities, having concluded from experiments and trials that it is unnecessary to have different heat values at the two parts. If this claim can be substantiated, a considerable advantage is gained by the fact that the two elements are interchangeable, a desired feature from the point of view of production and maintenance. Fig. 17 illustrates the bottom elements of the

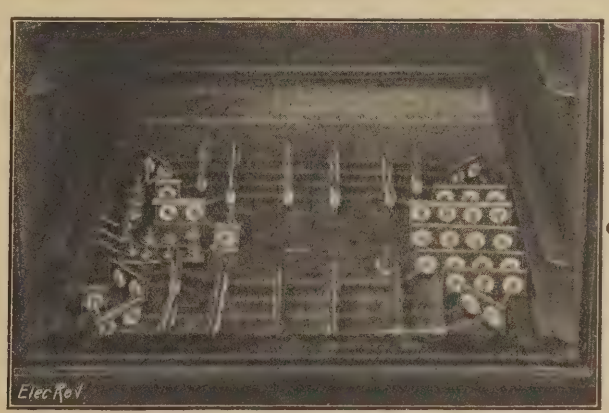


Fig. 17.—Bottom Oven Elements.

"Cosmos" cooker. The oven linings are easily removable to facilitate the effecting of repairs and replacements. This cooking apparatus is provided with an ample-sized hot cupboard placed between the oven top and the hob.

A recent addition to the field of electric cookers is the "Revo Family" model, fig. 18, manufactured by the Cable Accessories Co., Ltd., which is designed to suit a family of up to eight people. The oven is constructed in sections welded together, and has a capacity of 1.7 cu. ft. A novel feature in this cooker is the provision of a warming chamber, 17 in. wide by 15 in. deep and 6 in. high, situated as in the previously-mentioned

cooker between the oven top and the hob plate. This should result in the inevitable waste heat from both the oven elements and the hob plate units being utilised. The top plate is hinged, and when raised exposes the wiring to the boiling and grilling plates. Solid strip

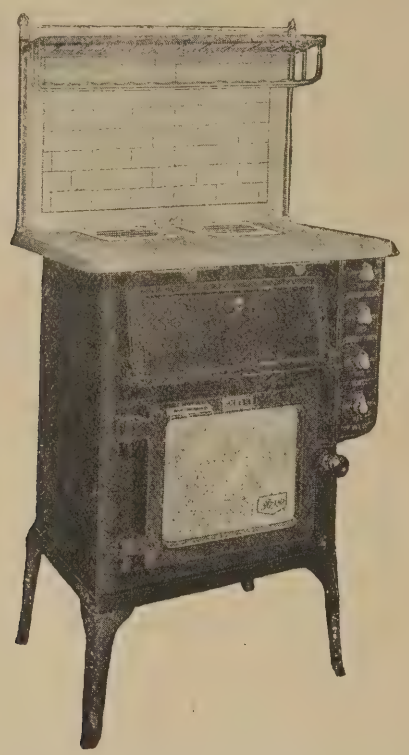

Fig. 18.—Cooker with Hot Cupboard Under Hob.

copper of heavy section is employed, supported, where necessary, by glazed porcelain insulators. The "Revotherm" boiling plate of this range is of the "semi-open" type; a heavy-gauge resistor is supported by steatite insulators, as near to the base of the

Fig. 19.—Construction of a Modern Cooker.

utensil as possible, and is permitted to radiate directly on to the latter in two directions. Immediately above each spiral is arranged a bar of the cast grid, which is of heavy section. This bar, it is claimed, effectively protects its adjacent spiral from damage by viscid liquids. Apart from the radiant heat utilised, a high percentage of heat is claimed to be conducted by causing the insulators carrying the spirals to make intimate contact with the grid casting. Each plate is carried by means of an easily-adjusted suspension system, and the removal of a plate is immediately effected by the loosening of three milled nuts. No contact is made with the top plate casting, and concentrated heating, it is claimed, is assured. The grill is constructed for three-heat regulation, low heat being available for quickly warming the hot cupboard.

The British Electric Transformer Co., Ltd. (Tricity), has recently introduced a range of three electric cookers specially designed to meet the requirements of hiring and housing schemes. The smallest of these, fig. 19, is claimed to be of particularly limited overall dimensions for a total loading of 5,000 W. Although in other models the makers have introduced either or both of the semi-enclosed and closed types of boiling plates, in this design only semi-enclosed plates are employed. Two plates are provided, one arranged with a 3-heat control and the other a single heat control. The 3-heat plate is arranged so that the medium heat is obtained in the centre of the plate. The element spirals are wound and housed on a grid-shaped fireclay base held in a light metal frame, two plates forming a

Fig. 20.—Hob with Closed and Semi-Enclosed Plates.

complete unit. The latter is held in position by means of four sockets in the base of the frame, which accommodate plugs projecting from a supporting platform underneath. The hob is hinged and provided with protecting plates arranged in grid form with the bars covering the elements. The spirals are placed so that radiant heat will reach the cooking receptacle obliquely from them. The bottom surfaces of the bars are concaved to present a maximum of area to the elements. The fireclay base is slotted to enable spilt liquids to pass through. An unusual accommodation for the grilling plate places it underneath the boiling units. It is of similar construction to the latter, except that the fireclay is not slotted, being, of course, inverted in this case. Two hooks at the back and a front screw hold it in position. The makers advocate top and bottom oven elements, and these are arranged so that they are distributed over the whole surface of the top or bottom, as the case may be, it being considered advisable to have a large element at a low temperature. These elements are built up in unit form of probably unique construction. The spirals are threaded through mica strips, suitable holes being provided with nickel eyelets. The micas are held width vertically in a sheet-metal frame which covers the surface. The oven linings are of plenished steel and the sides and top and bottom sections are all easily removable. The bottom plate is turned over at the edges, which fit suitably shaped runners, thus affording protection to the elements against spilt liquids, &c. The shelf runners consist of round metal

rod elbowed and riveted at each end. The main terminals for the cooker are at the back immediately under the hob plate, and rigid copper strip busbars are carried between the boiling and grilling plates to sub-main terminals at the front, from which nickel connecting rods are taken to the various element units. The element terminals are of pure nickel, and the sub-main terminals are nickel-plated. An interesting point about this small cooker is that the hob plate presents a dull black surface which, it is claimed, is partially

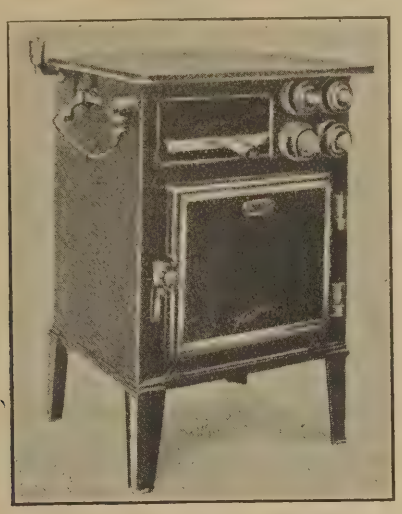

Fig. 21.—Combined Cooker and Water Heater.

rust-proof. The enclosed boiling plate adopted by this firm is constructed of mica strip-elements suitably insulated and clamped in iron frames, the whole being housed in a round metal inverted case. The plug and socket method of securing this plate is employed as in the case of the smaller model. In every cooker provision is made for a thermometer if required, the oven door being drilled and bushed. Fig. 22 illustrates the housing of one of each of the closed and semi-enclosed types of boiling plates in the intermediate cooker.

A novel departure from the standard methods of cooking by electricity in relation to the position of the elements has been adopted by Messrs. Geipel and Co. in the "Quead" cooker, which was described in our columns on August 21st, page 319. In this apparatus, it will be recalled, the source of heat is nearer the centre of the oven, and consists of two vertically-disposed elements adjustable horizontally so that they can be brought near to the meat for grilling or moved apart for roasting.

Much attention has of late been given to the question of water heating for domestic purposes, and in some directions this has been attempted in co-operation with the apparatus for ordinary electrical cooking. Such a combined cooking and water-heating apparatus is made by Messrs. Turner & Co., Ltd. A cylindrical boiler stands vertically next to the oven, and the water is heated by means of elements arranged in a central copper cylinder so that water circulation is set up. Another design of cooker incorporating water-heating equipment is made by Messrs. Archibald Low & Sons, Ltd. In this case, fig. 21, a copper tank is placed under the boiling plates and is so constructed that whenever the boiling plates are in use the water in the tank is being heated. An immersion heater is installed for quick heating. It is claimed that the effect of utilising heat from the hob plate units is to increase the overall efficiency of the cooker by 25 per cent.

The Shipping and Engineering Exhibition.

A Review of the Principal Exhibits of Electrical Interest.

(*Continued from page* 892.)

A "Shipping" Exhibition, opened by Mr. W. C. Bridgeman, First Lord of the Admiralty, would naturally be expected to have a marine atmosphere, and a pleasing feature was the demonstration of the extensive use that is now being made of electricity, not only for the purpose of driving auxiliary machinery aboard ship, but also in the building of ships themselves.

For instance, amongst the heavier machine tools shown many were arranged to be electrically driven, and it was satisfactory to note that in most cases the motor had been allowed for in the design of the standard machine, and not merely added as an extra. Such machines were to be seen on the stands of Messrs. C. A. Hunton & Son; Sumner, Vaughan & Co., Ltd.; Henry Pels; and the United Machine Tool Co., Ltd., particularly. An interesting machine made by the last-named company is an electro-mechanical toggle lever riveter having a direct motor drive, and operated in conjunction with an electric rivet heater. The smaller type of portable hand tool, such as drills, screw-drivers, grinders, riveting and chipping hammers, &c., was exhibited by F. Gilman (B.S.T.), Ltd., the Vidal Engineering Co., Black & Decker Mfg. Co., Ibbetson and Co., and the Kango Co., Ltd. S. Wolf & Co., Ltd., had electro-pneumatic patterns on view in addition, while S. H. Morden & Co., Ltd., make various attachments (for example, a miller for trimming wood) which are driven by a flexible shaft so that the tool can be used some distance away from the driving motor.

A noticeable point was the number of firms displaying electric welding plant, amongst them being the Quasi-Arc Co., Ltd.; G. D. Peters & Co., Ltd. (Wilson plastic arc and resistance systems); Allen-Liversidge, Ltd. (arc and resistance); the Consolidated Pneumatic Tool Co., Ltd. (spot, seam, tape and butt), and Alloy Welding

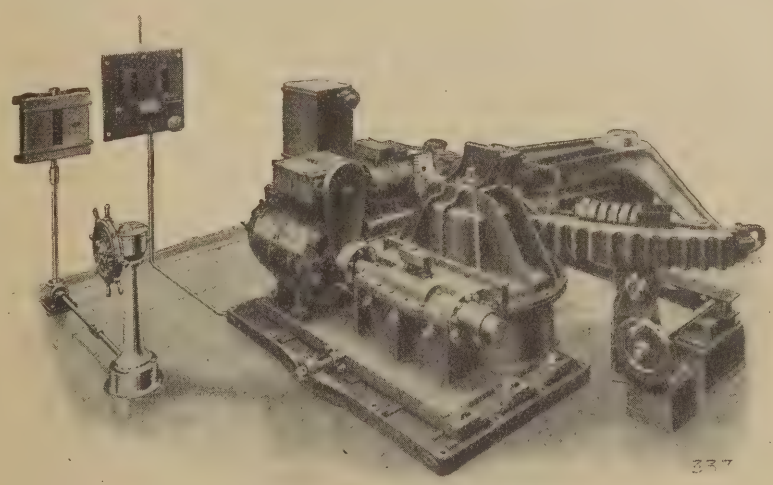

Fig. 7.—Donkin-Scott All-electric Ship's Steering Gear.

Processes, Ltd. (d.c.), which also owns the patents of the Daysohms a.c. welder.

Ships' Auxiliary Plant.

A good deal of the auxiliary plant in the engine room and of the deck machinery also is driven electrically

nowadays, especially aboard oil-engined vessels; amongst the fine display of Laurence, Scott & Co., Ltd., in addition to electric winches, gear for ships' windlass, motors and control gear, the direct-acting steering gear illustrated in fig. 7 claims an advantage in that no make or break of current takes place, operation being by the promotion and stoppage of the flow of current in permanently-closed circuits, which eliminates sparking and burnt contacts and therefore reduces renewals.

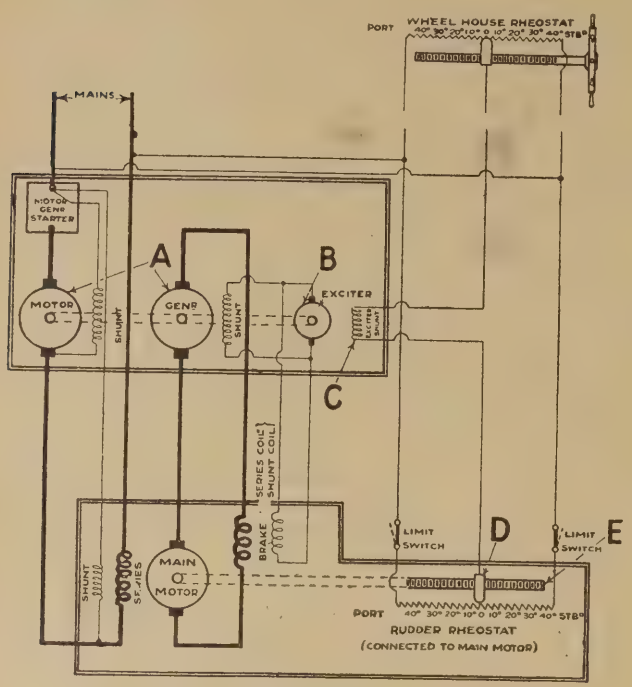

Fig. 8.—Steering Gear Diagram.

Referring to fig. 8, a motor-generator (A) takes current from the line, and runs all the time at sea. The generator supplies current at a varying voltage to the main motor connected directly to the steering gear, and to provide the varying excitation of the generator a small exciter (B) is connected on the shaft of the motor-generator, the motor end of which is started from the ship's mains by means of an automatic starter which will only open the circuit during a total failure of voltage, and automatically re-starts the motor when the voltage is restored. A drop in voltage, even to 25 per cent. of the full-load voltage, does not affect this gear, except to slow it down. The control of the steering gear is effected on the Wheatstone bridge principle, one resistance (forming two legs of the bridge) being in the wheel house, and another resistance (forming the other two legs) in the steering-engine compartment. The exciter field winding (C) takes the place of the galvanometer, and the resistance in the two rheostats is varied by a slider carried on a nut (D), which is fed backwards and forwards by a lead-screw (E). The screw of the rheostat in the wheel house is connected, generally with equal gears, to the wheel, so that any movement of the wheel displaces the slider, and thus upsets the electrical balance so that current flows through the exciter field winding. The other rheostat is mounted on the main steering gear motor, by which it is driven by reduction gearing. The result of current flowing in the exciter field (as referred to above) is that the exciter supplies current to the generator shunt; this machine then supplies the main motor armature, the voltage depending on the degree of displacement of the wheel rheostat and the consequent strength of the generator shunt.

The movement of the main motor armature moves also the rudder rheostat in such a sense as to bring its slider into coincidence with the new position of the wheel rheostat slider; by the time these two coincide, the exciter field winding has lost its current, the generator its excitation, and the main motor has lost its armature current, so that the whole system comes to rest. The voltage of the generator (and therefore the speed of the main motor) depends on the difference in position between the two sliders, so that for large degrees of helm the movement starts quickly, but tends to ease down gently as coincidence is nearly reached. Though the main motor thus slows down towards the end of its travel, it does not consequently lose its torque, as the generator can supply a big current at low voltage for completing the movement. When the wheel-house rheostat is hard over, the rudder rheostat still has a little way it can go, supposing that the rudder is being driven further over by the sea. The effect of a step or so over-run in this manner is to reverse the current in the exciter field winding, and therefore to bring the main motor back again to the same angle indicated by the wheel. As an additional precaution, limit switches are provided. The mechanical portion of this gear is made by Messrs. Donkin & Co., Ltd.

A crane motor fitted with the Scott "floating-brake" system of control for series-wound machines is shown in fig. 9, being a combined electro-magnetic and mechanical system. The brake is controlled by a small shunt winding, only used for full lifting and lowering, and a heavy series winding which (when energised) attracts the steel armature against the pressure of suitable springs, thus releasing the brake. The "floating" or low-speed steps of the controller, with the starting resistance in circuit, divert current from the series winding of the brake to such a degree that the pressure of the springs begins to overcome the opposing magnetic force and puts the brake partially on. In this condition the brake is "floating," the speed of the motor depending on the amount of current diverted from the series winding of the brake. The floating action on any braking step of the controller is nearly independent of the amount of load lowered, and is self-corrective, so much so that the braking surfaces can be treated with plumbago so as to diminish the co-efficient of friction without appreciably increasing the speed-control effect of the brake. The action is automatic and steady, for if the friction of the brake increases, the current taken by the motor and brake coil also increases, slightly easing the brake. If the friction decreases, the current in the brake coil decreases, and the braking action automatically increases.

Electric deck gear was also to be seen on the stands of the Sunderland Forge & Engineering Co., Ltd., and A. Harper, Sons & Bean, Ltd., and several firms showed air compressors and blowers suitable for ships' use. Oil filters and purifiers were well represented, five different

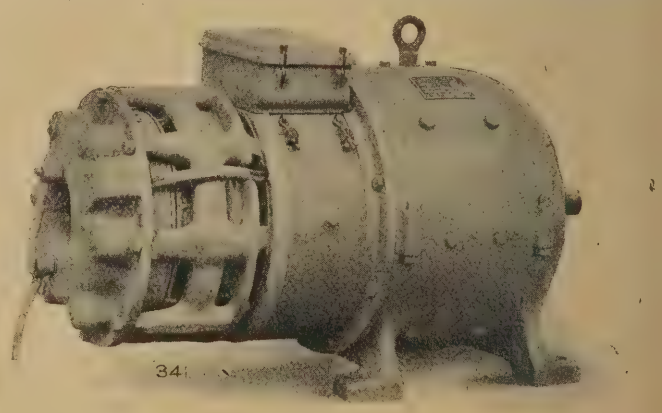

Fig. 9.—Crane Motor with Floating Brake Control.

makes of electrically-driven, centrifugal machines being noticed; electricity generating sets, driven mostly by internal-combustion engines, but including a few steam sets, and suitable for ships' auxiliary service or country house lighting purposes, were to be seen on at least 16 stands; one of the oil engines shown by the Parsons Motor Co., Ltd., was of 105 h.p. at 750 r.p.m. with six cylinders, coupled direct to a Brush 44-kW alternator with an exciter on the shaft extension. C. A. Parsons and Co., Ltd., in addition to transformers and an oil-tight terminal tapping, turbine blading (one sample being 42 in. long), samples of generator windings, &c., exhibited a geared turbo-dynamo of 100 kW running at 3,000 r.p.m.; the impulse turbine speed is 10,000 r.p.m., so that the speed ratio of the gear is 3⅓, and the steam conditions are 200 lb. pressure, 162 deg. F. temperature, and 27½ in. vacuum, the steam consumption being 19.8

lb. per kWh, which is reasonable for so small a plant. The weight of the set is 3.4 tons, including the bed-plate, which incorporates an oil reservoir and cooler.

Aids to Navigation.

Most interesting is the steady development of aids to navigation, which invariably have electrical features, the tendency being to make such devices more or less automatic. Besides loud-speakers, headphones, and a

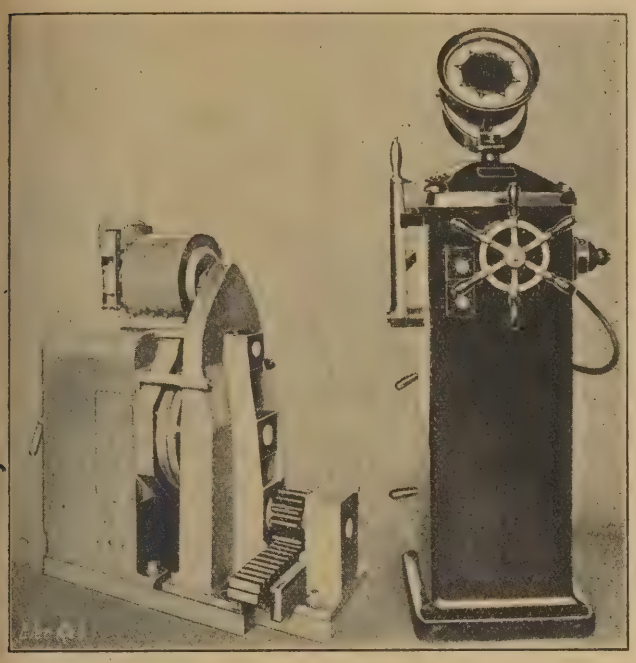

Fig. 10.—Two-unit Sperry Gyro Pilot.

loud-speaking telephone for ships, S. G. Brown, Ltd., showed a British gyro compass employing what is known as "liquid control" and with which is associated a different type of repeater for each particular purpose in navigation.

The Sperry Gyroscope Co., Ltd., demonstrated automatic steering equipment, including a gyro pilot (bridge and wheel house units), helm angle transmitter, and indicator. The master compass is mounted on a turn-table and, when moved, represents a change of heading of the ship which is electrically transmitted to all the compass auxiliaries, and also to the contact mechanism inside the bridge unit of the gyro pilot. This unit controls the starting and stopping of the power unit and will move the improvised rudder instantly, which in turn operates the helm angle transmitter, causing the helm indicator to show the rudder movement. Single-unit gyro pilots have been installed in nearly 100 merchant vessels, and on this occasion the new two-unit gyro pilot, fig. 10, made its *début;* it differs from the single-unit type in so far as the contact and power units are separated, the former being on the bridge, while the latter is connected direct to the throttle of the steering

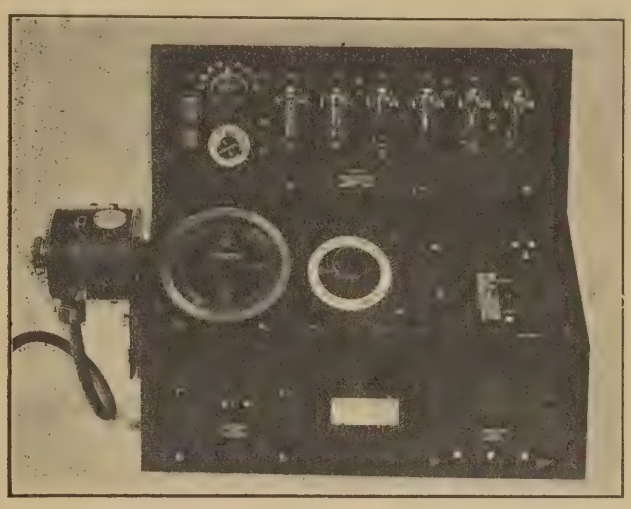

Fig. 11.—Direction Finder and Repeater.

engine. It is thus independent of the telemotor gear and the lost motion which invariably exists in that system; it also makes available duplicate and separate steering control on the bridge. The company's gyro compass equipment includes steering and bearing repeaters, a course recorder, and a repeater combined, with a Marconi radio direction finder as shown in fig. 11. A large percentage of the errors made in fixing the position of a ship by wireless d.f. are due to errors in the compass and reading it; the repeater enables the wireless operator to read the true bearing of any station at sight and is particularly advantageous at long range, in which case the error is proportional to the distance.

(To be concluded.)

The Problem of British Industry.

In the course of a paper which he read on December 2nd, at a meeting of the Liverpool Engineering Society, Sir William P. Rylands, J.P., said that there were three main factors underlying the great problem of British industry; the sociologic aspect, the economic effect of fluctuating currency, and the economic effect upon Great Britain of the war. No solution could be satisfactory which did not take these three factors into account.

Taking the first—the sociologic aspect, Sir William said that it was true that profit was the mainspring of national economic success and prosperity, but it was important to realise that the object was the prosperity of the people as a whole and not the advantage of a few. The war and the post-war period introduced a condition under which the standard of living was definitely raised, and the people of this country were reluctant to allow this to be reduced. It was thought by the workers that the ability of industry to pay these wages at that period indicated that wages could be kept up permanently, although the reply, of course, was that to maintain them we were living on our capital. The pound had been restored to its gold basis, but we had incurred a burden of eight thousand millions of national debt, a great increase in industrial capital, and a serious rise in local rates. If the producers produced only as much as they did before the war, it was inevitable that they must consume less if these burdens were to be sustained. The maintenance of a higher standard of living could only be achieved by substantially increased production—so substantial that the speaker felt that without a change in our economic policy it would be unattainable for many years to come. He was satisfied that in this country the Communist movement had not yet taken deep root, and it was important that we should not confuse the comparatively small Communist element with the vast number of men who cast their votes for Labour candidates from more rational motives. The theoretical Socialists pointed to the vast unsatisfied demand which existed in this country. There was, no doubt, an unlimited demand, while workless men stood idle, and there was evidence of unlimited capital available where there was a reasonable prospect of its profitable employment. The Socialists not unnaturally claimed this as evidence of the failure of the existing capitalistic system, a failure which could not be denied. Their only reply was that their system was as perfect as an imperfect world would allow; that it alone was suited to the peculiar conditions of Great Britain, and should not be changed; and for the rest that Socialism would even more lamentably fail.

Turning to the economic effect of a fluctuating currency, the speaker said that as the value of a currency fell there was a corresponding rise in the cost of all commodities imported into the country, and the world's values, in terms of the currency, were immediately adjusted. The cost of living in this country, however, was affected only to a limited degree by a change in the world's values. Wages and profits were ultimately governed by the internal value of currency, and until the cost of living rose there was no impelling necessity to increase wages. The exact converse was to be expected where the currency of the country appreciated in value, as it had in Great Britain. The return to the gold standard had raised the world's value of the pound by ten per cent., making the real cost of manufacture at least ten per cent. higher than it was 18 months ago. It would readily be appreciated how immensely this had increased the difficulties of our unsheltered industries. On the other hand, sheltered and quasi-sheltered industries, which escaped competition from the Continent, had been able to maintain their prices, wages, and standard of profit, thus greatly affecting the cost of living in this country. For this unsatisfactory condition there were three possible remedies.

viz., an increase in the gold value of Continental currencies; a decrease in the gold value of British currency; or a drastic reduction in wages and profits in the sheltered industries. The speaker considered that the first two remedies were impracticable, and it appeared unlikely also that the sheltered industries would willingly forego the advantages which they enjoyed; it would therefore seem that we must either adopt the policy of *laissez faire*, and hope that time would provide a solution of our difficulties, or examine the effect of any possible change in our economic policy with the object of sheltering unsheltered industries.

The principal economic effect upon Great Britain of the war was the aggregation of the huge national debt in addition to the large debenture and other debts incurred by industry during the same period. This had led to very heavy taxation, which necessarily came largely out of the pockets of the working man. If, therefore, as a result of our war debt, a large share of production was taken to pay interest, the workers engaged in industry must either produce more, or their standard of living must be definitely lowered. It was immaterial whether this increased production was for export or for home consumption, and when we reflected that the export trade of this country in volume was substantially less than before the war, it was clear that the home production must be vastly larger. The speaker believed that the key of the puzzle lay in the velocity of circulation of the purchasing power of the community. In this respect wages were far in advance of profits. If, therefore, wages were high, the "kinetic" energy of the aggregate purchasing power was incalculably increased. If wages were low, they were wholly absorbed in providing food and the bare necessities of life, to a great extent imported from abroad. He thought it a matter for congratulation that so many of our people were manifestly enjoying a relatively high standard of living, and he would regard a reduction with regret. Could we seriously hope to develop an increased export trade sufficient to meet our economic necessities? Throughout the world there was a definite tendency towards the development of national industry, and it was not easy to feel confident that we would be able in the future to do much more than maintain our present position, and there were grounds for apprehension lest, with the increasing industrialism of the world, our export trade would be conducted with ever-increasing difficulty. In a country which was completely self-contained there would be no limit to the standard of living which the people could enjoy, except in their capacity to produce. The United States had to some extent achieved this ideal, and consequently the standard of living there was higher than in any other part of the world. It might be definitely affirmed that the volume of a nation's foreign trade was not a matter for congratulation, but rather a measure of the disadvantage which it endured. These reflections suggested that we should seriously consider whether we had been right in the past in regarding our foreign trade as the first interest of the country, or whether it might not now be desirable that that general policy should be reviewed, and we should regard the development of the home trade as the first consideration. There was no doubt that that policy had been pursued by other countries with success. The solution of the problem of British industry must not be sought by regarding the interest of profit and finance as the first consideration. The prosperity of the working community demanded the utmost amount of employment, the highest possible wages, and the greatest velocity of circulation of purchasing power, by which means alone would the community be most amply provided with the amenities of life.

Russian Electrical Notes.

Swedish Telephones in Russia.—A Moscow dispatch published in Sweden announces that the Soviet Government has permitted the Low-Pressure Trust to enter into an agreement with the Svenska Telefon Aktiebolag L.M. Ericsson, under which the former takes over the exclusive right to manufacture and sell automatic telephone equipment on the Ericsson system in the Soviet Union, Afghanistan and Mongolia, together with the right of working all the Ericsson patents in Esthonia, Lithuania, and Latvia. Moreover, the Swedish company will supply all the equipment for automatic exchanges in Russia and will grant a long term credit. An inquiry made by the representative of a Stockholm newspaper elicited the statement from Mr. E. O. Sandberg, director of the company, that no confirmation of the telegram had then been received, although the company had carried on negotiations during the summer with the Low-Pressure Trust in Moscow. This information, which was published in Sweden on November 3rd, is now confirmed by the Moscow newspapers.

Suburban Railway Electrification. — The board of the State Planning Commission has approved a scheme submitted by a committee for the introduction of electric traction on the Northern and Moscow-Kazan railways between 1927 and 1929. The expenditure is estimated at 28,900,000 roubles, of which it is proposed to provide 4,000,000 roubles in the current fiscal year. Each train is to be composed of a motor car and two trailers, each capable of accommodating 160 persons. Each motor car is to be equipped with four 200-h.p. motors, and the speed is to be 28 miles per hour as compared with about 20 miles at present with steam locomotives. It is proposed to obtain the electrical equipment in the first place from abroad, and offers are said to have already been received; subsequent plant will be made at Russian works.

The Financing of Electrification Works. — One of the directors of the Electrical Bank states that a total of 51.3 millions of roubles was provided out of the Budget for electrification works in the year ended with September, 1925, this amount comparing with an average of 28 millions in the past three years. Besides this sum the bank issued credits for a total of 27.6 millions down to September 1st. These figures will be surpassed in the new financial year as the Supreme Council of National Economy has made application to the State Planning Commission for the insertion in the budget of a total of 150 millions for electrical works, while the bank itself expects to grant loans to the extent of from three to four times the amount of its capital.

Production in the Past Year.—According to the provisional figures prepared by the General Electric Commission, the production of the electrical manufacturing industry during the year ended September 30th, 1925, represented a value of 62,700,000 roubles or an increase of 83 per cent. over the year 1923-24. In the case of the machine construction works the output reached 12,400,000 roubles or 111 per cent. more than in 1923-24, while the output of the low-pressure works rose from 3.5 million roubles in 1923-24 to 8.4 million roubles in 1924-25. The value of the production of the cable works increased by 50 per cent. and that of lamps by 105 per cent. The number of workers employed rose by 26 per cent., although the adoption of improved mechanical methods in the lamp factories permitted of a reduction in the number of persons employed there. The output of the porcelain works was increased by 136 per cent., although the number employed rose by only 3 per cent. As to the value of the turnover in 1924-25, it is stated that the sales amounted to 82,100,000 roubles, as compared with 42,900,000 roubles in the previous year. The value of the sales grew quarter by quarter and, despite the expansion in the production, the demand exceeded the supply. During the year the prices of a number of products were reduced, particularly in the case of lamps, but the prices of machines were not lowered and are not expected to be reduced. The financial situation of the trusts remained strained throughout the year owing to the extension of the production without sufficient working capital.

Petrograd Lighting Situation.—As a result of delays in the delivery from abroad of the new sets of turbines for the Krasnya October station, the existing stations supplying Petrograd are fully loaded, and it has been necessary to set in operation again isolated generating plants of a combined capacity of 20,000 kW in order to cope with the demand.

Development in the Ukraine.—It is reported from Kharkoff that the commission on the electrification of the Ukraine has decided that it is necessary to construct stations in the districts of Krivoi Rog and Zaporozjen of capacities of 15,000 and 20,000 kW respectively. In the future these two stations would serve as steam reserves for the projected Dnieper hydro-electric works.

Low-pressure Apparatus. — The Low-Pressure Trust is experiencing a constantly growing demand for telephone, telegraph, and radio apparatus, &c. The orders received in September are stated to have reached record figures at a value of 6,300,000 roubles, or more than the total turnover in 1923-24. It is intended to extend the productive capacity of the various works so as to be able to meet the requirements.

Reductions in Lamp Prices.—The board of the Supreme Council of National Economy has made reductions in the wholesale and retail prices of the various kinds of incandescent lamps. At the same time the board has drawn the attention of the General Electrical Commission to the unsatisfactory quality and high cost of lamp glass, circumstances which considerably hamper a reduction in the costs of production, and it is added that the lowering of prices must not result in impairing the quality of the lamps.

The Accumulator Trust.—The value of the output of the Accumulator Trust in the year 1924-25 is reported to have been 1,724,000 pre-war roubles. The production during the current year is expected to reach a value of 2,960,000 roubles.

An Extension Fund.—As a result of the growing demand for electrical energy the General Electrical Commission has decided to create a special fund for extensions of works and the provision of new equipment. An inquiry is now being made as to the sources which are intended to be drawn upon in order to feed this fund, into which it is also proposed to pay the amounts set aside by different undertakings for the purpose of redemption.

October Production.—The value of the production of the various electrical trusts in October, which was the first month of the new financial year, is returned at 7,310,000 pre-war roubles, of which 6,096,000 roubles is credited to the State Electrical Trust, 975,000 roubles to the Low Pressure Trust and the balance to the Accumulator Trust. The output represented 84.5 per cent. of the production fixed under the programme.

The Volkhoff Hydro-Electric Works. — The progress in connection with the large hydro-electric works known as the Volkhoff station has been so considerable that it is expected that two turbo-generator sets will be set in operation next May and a full supply inaugurated in October, 1926. The main transformer stations in Leningrad, which are to be supplied by this station, have been practically completed, while the smaller sub-stations will soon be finished, together with the Leningrad cable network.

Reviews.

High-Pressure Electricity Transmission and Distribution.*

In view of the rapid development that is taking place in electricity transmission and distribution in all parts of the world it is nowadays not an easy matter for electrical engineers, young or old, to keep themselves fully posted with the progress that is being made. It is for this reason that the international conferences that are now being held almost annually are of value in that they form a common platform for the interchange of experiences and ideas of leading electrical engineers from all parts of the globe. Moreover, to those unable to attend the conferences, the very complete records of the proceedings that are subsequently published afford a means of digesting, as opportunity offers, the various solutions of the many difficult problems that beset all engaged in the work of electricity transmission and distribution, while at all times they form valuable additions to the electrical engineer's reference library.

A case in point is the volume which has lately reached us containing a complete record of the proceedings of the second International Conference on Large Electricity Distribution Undertakings at High Pressure which was held in Paris towards the end of 1923. In contradistinction to the World Power Conference held at Wembley last year, which dealt with all aspects of the subject of power, the Paris Conference was devoted to the single subject outlined above, which, however, embraces so many sub-subjects—if one may use such a term—that if it did not exceed the importance of the Wembley gathering, it is to the electrical engineer at least equal thereto. Some idea of the ground covered by the various reports and papers presented, all of which, together with the subsequent discussion thereon, are printed *in extenso* in the *Transactions*, may be obtained from the following summary of the particular questions allotted to the 1923 Conference :—

The Construction of High-Pressure Transmission Lines.
Insulators for Extremely High-Pressure Work.
The Construction and Working of Open-Air Transformer Stations.
The Selection of Transmission Pressures.
The Value Ratio between Kilometric Industrial Insulation High-Pressure Lines and the Service Pressure.
High-Pressure Cables.
Making Known the Dangers as well as the uses of Electricity.

Having published an account of the proceedings of the Conference at the time, and for reasons of space pressure, it is impossible for us now to refer to each of the fifty odd reports and papers presented, and hence a summary, and a brief reference to some of the more important contributions, must suffice. In the first section—that devoted to Current Generation and Conversion, there were only two papers, both, curiously enough, by American authors, one dealing with Outdoor Transformer Station Practice in the United States and the other with Recent Improvements in Oil Interrupters. On the subject of Transmission Masts and Conductors, there were altogether eleven contributions, four being from French authors, three from Italian and Swedish, and one British, this being by Messrs. E. B. Wedmore and W. B. Woodhouse, on "Recent British Investigations into Overhead Line Construction and the Material Employed." Insulators—Their Composition, Microstructure and Properties, brought together nine papers, in which American, French, Italian and British-Spanish practice was outlined, the subject giving rise to a lengthy and valuable discussion. Equally varied in experience and practice were the eight papers on Underground Cables which emanated from Dutch, French and Italian engineers, and from the British delegates, Messrs. P. V. Hunter and E. B. Wedmore, who dealt exhaustively with the question of the Heating of Conductors Embedded in the Ground.

Only one paper was submitted on the question of Educating the Public as to the uses of Electricity, this being by a Dutch author, who dealt at considerable length with the methods adopted in Holland in teaching children both the uses of electricity and the dangers associated therewith, the paper being notable for some very curious illustrations. Section II of Part 3 of the proceedings will doubtless be regarded by some readers as one of the most important as it includes particulars of the rules and regulations in force, or projected, in France, Switzerland, Holland, Belgium, Poland, Russia and Great Britain, in regard to the establishment of electricity transmission lines at very high pressures with the object of securing the public safety, many useful suggestions being made in the subsequent discussion. Three authors—American, French and Italian—gave their ideas with regard to transmission pressure standards, while the wide range of international experiences recorded in Part IV, which deals with The Operation and Protection of High Pressure Transmission Lines and with Pressure Measurements, is evidenced by the fact that the authors represented seven countries. The final paper was one by M. E. O. Meyer, of the Strasburg electricity station on "The Means of Communication in Electrical Undertakings," in the course of which he alluded to the prominent part wireless telephony is likely to play in the not-far-distant future.

*The verbatim report of the second High-Pressure Conference, held at Paris, November, 1923. Edited by J. Tribot Laspière, General Secretary of the Conference. Pp. 1159; fully illustrated. Paris: l'Union des Syndicats de l'Electricité. **Price, 120 fr.**

The Conference was attended by electrical engineers from no fewer than twenty countries, Great Britain being represented by delegates from the Institution of Electrical Engineers, the British Electro-Technical Committee, and the Electricity Commissioners, as well as by eight independent members, and a useful feature of the volume is an alphabetical list not only of the names of the authors of the papers, but also of all who took part in the discussions. Furthermore, their addresses are also given, thus affording any electrical engineer who may desire additional information on any particular point an opportunity of communicating direct. The *Transactions* are printed throughout in French, and in view of the fact that various languages were used during the meetings, the work of compiling the report is a tribute not only to the editing capabilities of M. Jean Tribot Laspière, the general secretary of the Conference and of the Union des Syndicats de l'Electricité, and his staff, but also to the translators. Altogether there are nearly 1,200 pages in the volume, which also includes approximately 400 line and photographic illustrations, rendering it, as we have already said, a valuable work of reference to all interested in electricity transmission and distribution at high pressures.

C. J. W.

Primer of Costing. By R. J. H. RYALL, F.C.W.A. Pp. viii + 115; 27 charts and forms. London: Sir Isaac Pitman and Sons, Ltd. **Price 5s. net.**

When one of the leading cost consultants in the Kingdom, Mr. R. J. H. Ryall, writes a Primer of Costing, one's interest is naturally aroused. It would appear, at first sight, that not only is it late in the day for a primer on this important subject to be written at all, but also that, from the pen of one who is so well placed in the profession, a treatise on advanced costing was to be expected.

A glance at the first chapter is, however, sufficient to dispel any such misapprehension, for one is reminded that there is, so far, no authoritative terminology of costing; that no two firms treat certain items of cost in exactly the same manner, particularly their items of establishment expenses; moreover, that this is the first primer of costing that has been published in this country.

That many people think they know all there is to know about costing, when they have scarcely probed beneath the surface, is only too clearly demonstrated by the fact that many firms, professing to have the soundest of costing systems, possess, in actual fact, a most unwieldy object which gives them some figures now and again, and which has been evolved by means of a series of spasmodic additions and minor revisions, introduced by generations of men. If some of these would study this primer, forget for a while the supposed glories of their own pet systems, and begin to think carefully upon the precepts and first principles herein laid down, their trade and industry would be the better fitted to withstand the ever present competition that it is called upon to face.

The preface tells us that the book is written for cost clerks, and particularly for those who contemplate sitting for the examinations of the Royal Society of Arts. The author is too modest. The work should be read by everyone interested in costing, for it cannot fail to give him a clearer view of the beginning of things; to those who depend upon costing in their business, its perusal is a necessity.

The book takes the reader through each stage of costing and outlines the steps needed in cost finding, cost control, and cost estimating. Each point is dealt with simply, but effectively, in language that is straightforward and to the point. There are no diversions into abstruse theories and no endless complications. Twenty-seven forms and charts illustrate the text and these in themselves are most valuable, for they are obviously designed by a practical man who understands that the workshops require, in all cases, the simplest possible form that will effectively serve its purpose. If such forms as these are employed, there can be no doubt in the workers' minds as to what they are expected to enter, where they are meant to write it, and why it is asked for. Therein lies one of the problems of the cost accountant. It is easy to make complicated original records, which are invariably filled in wrongly and cause the men in the shops to waste their time trying to find particular spaces. Sooner or later, information will be required which is not found to be immediately available from the existing records, with the result that a further form has to be added. After a while, many extra forms are introduced and more or less conscientiously filled in, but only used when particular information is required. Files, bearing all this matter, are stacked up, and the clerks have to spend large portions of their time on work, only a small portion of which is actually useful. The correct design of forms in the first case, by one really familiar with actual requirements, saves endless waste. All cost accountants would do well to have a periodical "stocktaking" of their forms, in order to weed out duplicated or superabundant information.

Another point in this book that attracts attention is that Mr. Ryall has got away from engineering in his main and in most of his other examples. So many of the text books on costing, and particularly those that come over from the States, make it appear that the one, and perhaps the only, field for costing is the engineering industry. Here we are told of the cost of buttons in ready-made clothing and other homely necessities of life. It is, to say the least of it, bracing. The reader will find that "something different" to stimulate his interest.

Almost every term used is defined. Terms need defining nowadays, for the standardisation of terminology proceeds but

slowly, and is, so far, a long way from being an accomplished fact.

There are many points upon which we feel we should like the author's opinion and which we should like to see treated in his book, such as a simple calculation of machine rates, examples of the executive uses of costs, the relation of estimating to costing, an example of cost analysis—but we must remember that it is a primer we are reading, and we can only admire the restraint of the author in refraining from treating at length the higher branches of costing before the "grammar" is understood. To have touched upon the points enumerated would have meant departure from a general treatise on costing and the introduction of examples drawn not only from particular industries, but from particular factories. We must, therefore, in this connection, look forward to the day when the author sees fit to deal with costing in its more advanced and more particularised aspects.

"A system of cost accountancy must be devised to fit the business and not the business to the system," is a sound warning to those inclined to rely on ready-made systems.

The notes in the concluding chapter are of great importance. They deal with the routine and procedure of work in a cost department, and here, for the first time, we think, is laid down the correct fundamental duties of cost clerks. It would be well if every firm studied the "progressing" of work in its offices. Clerical work is too often looked upon as an unnecessary evil. Paradoxically enough, little attention is paid to the question of wasted effort in this sphere. It would surprise many a manager to find what saving could be made by detailing just what each of his clerks is expected to do, how and when he is to perform each of his duties and what is the value of his work.

There is an appeal in this book to many different classes, chief amongst which are:—

(*a*) The Manufacturer, who prides himself upon the adequacy of his own costing system, for he may recognise that even in his cherished methods there may be some important error of principle.

(*b*) The Cost Accountant, who is absorbed in the routine of his costing and in the tabulation of results and statistics, for, if nothing more, it will be refreshing to him to think of the why and the wherefore of the first principles.

(*c*) The Consumer, who may be searching for knowledge of what the other half of the world does, for he will be given a concise survey of how manufacturers and distributors should endeavour to give equitable prices instead of making him pay for wastages.

(*d*) The Technical Man, who is responsible for design and economic manufacture, for then he will be shown what benefits he should expect in return for the shop records which he sends to the cost department; and

(*e*) The Student, for whom the book is essentially written.

We have no hesitation or fear in recommending Mr. Ryall's Primer of Costing to anyone who falls within any of these classifications, and we heartily congratulate the author upon the production of a readable book which fills a long-felt want in the literature of costing.

Legal.

Metropolitan-Vickers Electrical Co., Ltd., v. British Thomson-Houston Co., Ltd.

THE judgment of the Court of Appeal in favour of the plaintiffs and appellants was recorded in our last issue. Later, Mr. TREVOR WATSON, for the defendants, said that their Lordships' refusal to grant a stay of the injunction had led to a serious question regarding the defendants' current contracts. They had, however, obtained the plaintiffs' permission to deliver machines on order, and had agreed to pay the plaintiffs 10 per cent. on the value of the starting motors and rotary converters so delivered.

Sir Duncan Kerly, K.C., confirmed this and the Master of the Rolls acquiesced.

International Wireless Manufacturers, Ltd.

IN the Companies Winding-up Court on December 1st, Marconi's Wireless Telegraph Co., Ltd., petitioned for an order for the compulsory liquidation of International Wireless Manufacturers, Ltd.

It was stated that the plaintiffs were judgment creditors of the respondent company, the amount of the debt and costs being £247. The company's capital was £100, but, a few months after it was formed, debentures for £4,000 were issued.

Counsel for the respondent company asked for an adjournment until the first petition day in February next, as the company hoped to raise fresh capital.

In this case Mr. Justice Romer earlier in the day made a compulsory order, the company not being represented, but on it being explained that the absence of representation was due to inadvertence, his Lordship granted the adjournment to which the petitioners consented.

Unprotected Electrical Apparatus.

AT Accrington on December 2nd, the Broadoak Print Works, Ltd., Accrington, a branch of the Calico Printers' Association, was fined £10 for a breach of the Factories and Workshops Acts, 1901 to 1911.

Mr. H. TOPHAM, H.M. Inspector of Factories, said the case was the sequel to an accident to James Carter, electrician's labourer, who was found in a drying-room unconscious with his neck against a portable electric standard. He died soon afterwards. Adequate precautions had not been taken to prevent the standard from becoming electrically charged.

For the defence it was submitted that every precaution had been taken.

British Thomson-Houston Co. Litigation.

IN the Chancery Division on Friday (December 4th), Mr. Justice Tomlin heard a motion by the British Thomson-Houston Co., Ltd., for an injunction restraining infringements of its patents relating to electric lamps by E. A. Siderman, R. H. Wood, and Walter Thomas Smith, Ltd.

Mr. TREVOR WATSON, for the plaintiffs, said they had obtained injunctions against a large number of small retailers, that being the only method of preventing the importation of foreign lamps. But the multitude of injunctions had made importers exceedingly wary, and as a result there was a considerable and highly-organised business in these lamps which made it very difficult to get evidence. The manner in which it was carried on was this: The importers sent the lamps to a warehouse, and they could not be got from there except by telephone. The importers had appointed a number of retail dealers, and they also were very wary and would not treat with anybody who was not known to them. Nor would they treat except by telephone messages. They never kept any stock, they said, and got lamps from the warehouse in response to telephonic orders. If a particular retailer was stopped by injunction the principals had no difficulty in appointing another. Thousands of pounds' worth of foreign lamps were sold every week, and the Board of Trade returns showed an enormous importation of these lamps. This was the first occasion on which the plantiffs had been able to track a retailer to the actual warehouse, and the defendants were two retailers and the people who appeared to be in charge of the warehouse.

The evidence as to purchase was contained in affidavits. One witness said that on November 16th he went to Albany Wharf, Albany Street, N.W., the gates of which bore the name Walter Thomas Smith, Ltd. He told a man that he wanted to buy some foreign electric lamps, and was referred to Siderman at Grafton Street, Tottenham Court Road, as they did not deal with small orders there. At Mr. Siderman's he was informed that all business must be strictly confidential and nobody must be told the price which he had paid, nor was he to tell anybody in the street what he had got in his parcel. No lamps, said Mr. Siderman, were kept on the premises, and customers must telephone their orders. He obtained the lamps that he wanted. Another witness said he followed a messenger with lamps from Albany Wharf to Grafton Street, and a further witness swore that Walter Thomas Smith, Ltd., paid the rates of the wharf.

There was no appearance for the defendants and his Lordship granted the injunction asked for.

IN the Chancery Division on December 4th, Mr. Justice Tomlin granted an injunction on the *ex parte* motion of the British Thomson-Houston Co., Ltd., restraining the London Electric Lamp Co., of Sandcroft Street, Kennington, S.E., from infringing its patents for leading-in wires for electric lamps and gas-filled lamps. His Lordship said the injunction would be over last Tuesday (December 8th).

Manchester Electrical Engineers' Dance.—We do not know whether electrical engineers are more enthusiastic about dancing than, let us say, lawyers or physicians, but it is noteworthy that three large annual functions are now devoted to this form of amusement.

Of these, the Manchester or Northern dance was held last Friday, December 4th, at the Midland Hotel, and was attended by some 260 engineers and their friends. Unhappily, the very dense fog which prevailed all day caused a number of notable absentees, but those who succeeded in surmounting this difficulty spent a most enjoyable evening. It is well known that what Lancashire does to-day, the rest of England will do to-morrow, and readers in Birmingham and London (where they also dance) may care to note the unusual nature of the Manchester programme. A dinner was served at 9.15, following the first three dances, so that the guests might secure that "after supper" feeling early on. After a few more dances, a cabaret show was given, and still later an exhibition dance was performed by the professional exponents attached to the Midland Hotel.

The distribution of gaily coloured favours in the shape of hats, parasols, balloons, &c., added greatly to the general amusement, and Mr. G. H. Fawcus (the hardworking hon. secretary) and his colleagues who carried out the executive work which such a function requires may congratulate themselves heartily on a very successful evening.

Electricity in an Ancient Setting.—The Hastings Corporation is to supply electricity to Rye and Winchelsea and has agreed to preserve the "old-world" appearance of these historic towns by adopting street fittings to fit in with the surroundings.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

The Christmas Holidays.—The ELECTRICAL REVIEW for December 25th will appear one day in advance of the usual time of publication owing to the Christmas holidays. The attention of advertisers is therefore called to a notice appearing in our advertisement pages to-day. Alterations to existing trade advertisements for that issue must be received by Wednesday, December 16th, but copy for Official Notices, Situations Vacant, &c., will be in time if delivered at 4, Ludgate Hill, E.C., by 5 p.m. on Monday, December 21st. Correspondents and other contributors to our editorial pages are also requested to bear the earlier publication arrangements in mind and to forward their articles and news items without delay.

The Shannon Scheme Dispute.—At a special meeting of the Free State Labour Party and the Trade Union Congress in Dublin last week, it was decided to treat the Shannon project as "black." A resolution was passed condemning the rates of wages offered, declaring that the Free State Government's policy must be fought, and instructing trade unionists not to work on the scheme. Senator O'Farrell said that the Government was endeavouring to impose "slave-like conditions of labour," and asserted that the Government would never be able to carry the scheme to a successful conclusion, for competent workers would not accept the terms. Mr. Tom Johnston said he found that if 50 per cent. more than the amount allowed for the cost of labour under the Shannon scheme—£90,000—were expended, the scheme would still be economic, and would not involve an increase in taxation or charges for electricity.

Recent Contracts.—Members of the Federation of British Industries have recently received important contracts, among which are a number of orders for valves, including those for the Arapuni (New Zealand) hydro-electric scheme, secured by Messrs. J. Blakeborough & Sons, Ltd.; electric locomotive hoists for railways in China, India and Brazil, and two electric luffing jib cranes for the Nitrate Railways Co., Ltd., ordered from Messrs. Ransomes & Rapier, Ltd.; and the supply of steelwork for sub-station buildings in connection with the electrification of the Bombay, Baroda and Central India Railway, by Messrs. Wm. Bain & Co., Ltd.

E.D.A. Activities.—We have received some further examples of the advertisements which the British Electrical Development Association is inserting in newspapers and periodicals during the current winter. These are very attractive, but their chief value lies in their adaptation to the class of paper in which they appear. This is an important matter which is not always considered by advertisers, who are often content to let the same advertisements do for journals which cater for widely-separated interests.

Works Visit.—During the recent annual meeting in Birmingham of the Coke Oven Managers' Association, a party of members paid a visit to the Witton Works of the General Electric Co., Ltd. The Magnet Club was put at the visitors' disposal for the day, and they were entertained to luncheon by the company, Dr. A. H. Railing being in the chair. At the luncheon Mr. P. T. Nicholson, president of the Association, expressed the members' thanks to the company.

Salford Tramway Dispute.—About 150 men employed at the Frederick Road tramway depôt of the Corporation Tramway Department, ceased work on November 26th following the suspension of two men and three youths. The terms provisionally agreed upon by the Department and the trade union officials for the settlement of the dispute were accepted by the men later, and they resumed work on December 3rd. During the strike the normal tramway service was fully maintained, with the exception of a few cars awaiting repair.

Safeguarding Iron and Steel.—Efforts are being made to secure the imposition of an import duty on foreign iron and steel. The Civil Research Committee has investigated the position and is expected to issue a report shortly. On December 2nd a number of representatives of the industry, including Sir Arthur Dorman, Sir Frederick Mills, and Mr. Peach, met the Unionist Safeguarding Committee and presented the case for the inclusion of the iron and steel industry in the provisions of the Safeguarding of Industries Act. The Committee expressed itself as being in favour of the scheme and promised to bring the matter to the attention of the Government.

Local Exhibitions.—TODMORDEN.—On December 1st an electrical exhibition was opened at the Todmorden Town Hall. Councillor J. Jackson (chairman of the Electricity Committee) presided, and said that town life could not be what it ought to be until electricity was used exclusively for heating, lighting and cooking.

BURNLEY.—In addition to opening a special showroom in Manchester Road, the Burnley Electricity Committee has decided to organise an electrical exhibition in the centre of the town, and a committee has been appointed to make the necessary arrangements.

BACUP.—The Corporation has decided to hold an electrical exhibition in the town in February next.

Rubber Industry.—On Monday last, at the meeting of the Institution of Rubber Industry, held at the Engineers' Club, London, Dr. S. S. Pickles, chairman of the Rubber Research Association Library and Information Bureau Committee, read a paper on "The Importance of an Adequate Intelligence Service for the Rubber Industry."

Textile Mill Electrification Contracts.—Several important contracts for electrical driving and direct-geared turbine driving of textile mills, both at home and abroad, are being executed by the Metropolitan-Vickers Electrical Co., Ltd. The principal home contracts include the Victoria Cotton Mills of Messrs. J. & J. Hayes, Leigh, Lancashire; the Park Lane and the Greenbank No. 1 and No. 2 mills of Messrs. John Hawkin and Sons, Preston; the Rishton Mill of Messrs. O. & J. Folds, Ltd., Burnley; and the Bleach & Dye Works of Messrs. John Welch & Sons, Chinley. The equipment of the Victoria Mills includes a 2,000-kW, 3-phase, 2,200-V, 3,000 r.p.m. turbo-generator, and motors totalling about 3,000 h.p. The electrical equipment in hand for the three mills of Messrs. John Hawkins and Sons includes motors totalling over 3,500 h.p.; for the Rishton Mill motors totalling about 500 h.p. are being supplied; and the equipment now being installed at the important works of Messrs. John Welch & Sons includes two generators of 250 kW and 50 kW respectively, and motors totalling about 400 h.p. An order for a new mill at Sao Paulo, Brazil, includes motors totalling 730 h.p. and transformers with an aggregate capacity of 2,100 kVA. Other contracts for Brazil include motors totalling over 1,200 h.p. for use in eight different mills.

Lead. — Messrs. James Forster & Co. state under date December 5th :—" If the fall in America continues, as from all indications appears to be probable, prices must recede further here as there is not sufficient demand in this country or on the Continent to absorb American lead as well as the large supplies from Australia and elsewhere."

British Insulated Change of Name. — THE BRITISH INSULATED & HELSBY CABLES, LTD., has, by extraordinary resolution, passed last Friday, decided to change its name to British Insulated Cables, Ltd.

The British Industries Fair.—*Reuter* (Montreal) reports that many Canadian manufacturers will send exhibits to next year's British Industries Fair. Through the good offices of Mr. F. W. Field, the Senior British Trade Commissioner, considerable interest has been aroused in the Fair in Canada.

Trade Announcements.—MR. R. CHILDS has retired from his partnership in Erlco at Reading, and Messrs. Bravey and Blackmore, the remaining partners, are carrying on the firm. Mr. Childs is opening business as an electrical engineer at Station Road, Henley-on-Thames, and asks for copies of catalogues and lists.

MESSRS. GEORGE H. SCHOLES & CO., LTD., Manchester, announce that they have made an alteration in their "Sanco" joint box, and have reduced the price.

Catalogues and Lists.—MESSRS. BLACKSTONE & CO., LTD., Aldwych House, W.C.2.—An illustrated folder dealing with an unchokeable pump with various forms of drive.

BRITISH INSULATED & HELSBY CABLES, LTD., Prescot, Lancashire.—Catalogue P.192, containing full details and illustrations of pole transmission line equipment. A great deal of useful technical information regarding transmission-line design is given at the end of the publication.

MESSRS. R. A. LISTER & CO., LTD., Dursley, Gloucestershire.—An illustrated catalogue, with price list, of small electric lighting and power plant, including switchboards, batteries, and other auxiliaries.

THE WESTINGHOUSE ELECTRIC & MANUFACTURING CO., East Pittsburgh, Pa., U.S.A.—Motor Application Circular No. 7,378, dealing with the use of electrically-driven machinery for handling materials. Illustrated.

THE IGRANIC ELECTRIC CO., LTD., 147, Queen Victoria Street, E.C.4.—Leaflets Nos. 920 and 925, dealing, respectively, with oil-immersed and air-break, hand-operated, star-delta starters.

MESSRS. FALK, STADELMANN & CO., LTD., 83-93, Farringdon Road, E.C.1.—A showcard advertising the "Efesca" regenerative aerial tuner; also a catalogue (No. 563) of "Efesca" signs, lanterns, and reflectors. Illustrated and priced.

THE GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, W.C.2.—Folder O.S. 3793, containing particulars and prices of "Osram" radio valves; a circular letter dealing with the company's counter service; also Leaflet O.S. 3,794, describing "Osram" decorative lamp outfits.

MESSRS. L. G. HAWKINS & CO., LTD., 30-35, Drury Lane, W.C.2.—A priced pamphlet describing the "Dakol" daylight unit.

SIEMENS & ENGLISH ELECTRIC LAMP CO., LTD., 38-39, Upper Thames Street, E.C.4.—December price sheet of electrical materials and appliances.

MESSRS. CUNNINGHAM, 169-171, Edgware Road, W.2.—An illustrated price list of radio receiving sets.

THE ELECTRICAL EQUIPMENT & CARBON CO., LTD., 109-111, New Oxford Street, W.C.1.—List No. M.7, containing illustrations, specifications, and prices of d.c. and a.c. motors.

THE WATLIFF CO., 87, Cambridge Road, Kilburn, N.W.6.—A net trade price list of commutators for small motors and generators, including automobile and fan machines.

BRITISH BROWN-BOVERI, LTD., Trafalgar House, Waterloo Place, S.W.1.—An illustrated pamphlet advertising the company's turbo-alternators, and the "Brown-Boveri Review" for November, describing work carried out by the company's Swiss principals.

THE VISCO ENGINEERING CO., LTD., 162, Grosvenor Road, S.W.1.—Publication No. 243, containing an illustrated description of the company's cooling towers.

THE MULLARD WIRELESS SERVICE CO., LTD., Nightingale Lane, Balham, S.W.12.—A display carton for shop windows advertising "Mullard" radio valves.

MESSRS. R. ROBERTS, LTD., 53, Newton Street, Birmingham.—An illustrated trade price list of radio components.

THE MARCONIPHONE CO., LTD., 210-212, Tottenham Court Road, W.1.—A series of cardboard cut-outs advertising "Mellovox," "Baby," and "Dinkie" loud-speakers, and a window card advertising Marconi valves.

THE EAST LONDON RUBBER CO., LTD., 29-33, Great Eastern Street, E.C.2.—An illustrated price list of Christmas presents, including a number of electrical appliances.

Bankruptcy Proceedings.—W. R. SQUIRE, 11, Steward Street, Spring Hill, Birmingham, electrical engineer.—The public examination of this debtor was held on December 2nd, at the Court House, Birmingham. The statement of affairs showed liabilities expected to rank of £67 and a deficiency of £41. Debtor said that he commenced business as an electrical engineer in 1907. The business was discontinued in March, 1916, when he was employed on munitions, and he subsequently joined the Navy. In April, 1919, he recommenced business as an electrical engineer with a capital of £140, and was successful until May, 1923, but by reason of certain loss he found it difficult to continue. The examination was closed.

D. A. GRIFFITHS, Abercwmboi, and R. L. H. HUGHES, Aberdare, Glamorganshire, lately trading in partnership at Aberdare as Griffiths & Hughes, electrical engineers.—The first meeting of creditors was held on December 4th at Cardiff. According to the statement of affairs, there were gross liabilities of £509, of which £472 was expected to rank, and assets of £30, leaving a deficiency of £442. Debtors attributed their failure to losses on contracts through underestimation and trade depression. The Official Receiver remains trustee.

M. BREINGAN, electrical manufacturers' agent, 57, Robertson Street, Glasgow.—Public examination December 21st, at Mr. Sheriff Fyfe's chambers, County Buildings, Glasgow. Meeting of creditors January 18th, at the Faculty Hall, St. George's Place, Glasgow.

W. P. YOUNG, trading as W. P. Young & Co., and the Leicester Tanning Machinery Co., Sanvey Gate, Leicester, mechanical and electrical engineer.—An application for the discharge of this debtor was heard on December 3rd, at the Castle, Leicester. The discharge was granted subject to debtor's consenting to judgment for £50.

E. O. HENSTOCK, electrical engineer, 21, Old Road, Brampton, Chesterfield.—Receiving order made December 2nd, on debtor's own petition.

W. R. J. WHITE, electrical agent, 29, Great Pulteney Street, W.C.—Bankrupt discharged subject to consenting to judgment for £50 being entered against him by the Official Receiver (£50 paid to the Official Receiver in lieu of entering up judgment).

L. N. STRIBLING and A. E. SETTERFIELD (Stribling & Setterfield), electrical engineer, 17, Market Place, Margate.—Trustee, Mr. A. H. Ward, Official Receiver, 10, Burgate Street, Canterbury, released November 30th.

H. WILSON, electrical contractor and decorator, 1057, Grangefield Avenue, Thornbury, Bradford.—Last day for proofs for dividend December 18th. Trustee, Mr. J. O. Morris, Official Receiver, 12, Duke Street, Bradford.

J. N. DAVENPORT and L. A. HACKETT (Davenport, Hackett and Co.), electrical engineers and contractors, 36, Spring Gardens, Manchester, and Albert Mills, Albert Street, Manchester.—Last day for proofs for dividend, December 18th. Trustee, Mr. A. Grierson, 21, Spring Gardens, Manchester.

NEWMAN & Co., radio and electrical engineers, Radio House, 17, Shepherd's Bush Green, W.—Receiving order made November 25th, on creditor's petition. First meeting, December 10th; public examination, February 19th, both at Carey Street, W.C.

A. A. WATMOUGH, carrying on business together with W. HURWORTH in co-partnership as Hurworth, Watmough & Co., electrical engineers, 41, Town Street, Horsforth, and 1, Back James Street, Harrogate.—Application for discharge to be heard December 21st, at the County Court House, Leeds.

R. L. FOGGIN (Tithebarn Radio Co., Crosby Radio Co., and High Bridge Radio Co.), 63, Tithebarn Street, Liverpool, 75, Crosby Road North, Waterloo, Liverpool, and High Bridge, Newcastle-on-Tyne.—Last day for proofs for dividend, December 16th. Trustee, Mr. E. D. Symond, 11, Dale Street, Liverpool.

Dissolution of Partnership.—PECOVER & ADEANE, furnishing manufacturing ironmongers and electricians, 9 and 10, Bathurst Street, Hyde Park Gardens, W.—Mr. F. T. Pecover and Mr. H. Adeane have dissolved partnership. Mr. Pecover will attend to debts and will continue the business under the same style at the same address.

Company Liquidations.—BURY ELECTRIC PLANT CO., LTD.—Winding up voluntarily. Liquidator, Mr. T. S. Smith, of Messrs. C. R. Scholes & Co., Silver Street Chambers, Bury. Meeting of creditors December 11th, at the liquidator's offices. Particulars of claims to the liquidator by December 31st.

GALLETTI'S WIRELESS TELEGRAPH & TELEPHONE CO., LTD.—A meeting of creditors is called for December 14th, at the Liquidator's Offices, 36, Walbrook, E.C. Particulars of claims to be sent to the Liquidator, Mr. H. J. Page, by December 31st.

Private Arrangements.—MORRIS KELLY, 12, Jackson's Row, Deansgate, Manchester, wholesale and retail wireless storekeeper.—A meeting of the creditors of the above was held on December 2nd, when Mr. Gillett presented a statement of affairs as at November 26th, which showed liabilities of £1,209, all due to unsecured trade creditors, and there was an estimated deficiency, subject to the costs of realisation, of £749. Mr. Gillett said that there had been several judgments, and accordingly, for the protection of the assets, a deed of assignment was executed in his favour. Unless something like 10s. in the £ were forthcoming, the creditors would probably decide on bankruptcy. The debtor started the business at 12, Jackson's Row, Deansgate, as a wholesale and retail wireless storekeeper, on April 14th, 1923. Previous to that, he had been a photographer, commission agent, &c. The debtor had informed Mr. Gillett that his capital was £100, and he also borrowed £250 from a son. The debtor had no offer or scheme to put forward. At the present moment he was contemplating starting in another business. It was resolved that the deed of assignment already executed should be registered, and that an offer should be accepted of 10s. in the £, payable at 3, 6, 9, and 12 months, the whole 10s. to be guaranteed, failing which the estate would be dealt with in bankruptcy.

The following are creditors:—

	£		£
Lever, E. J.	230	Ripaults, Ltd.	41
Dundas Fox, W.	117	Palatine Accumulators Co. ...	43
Toubkin, J.	24	Forms Co.	28
Houlman, L.	33	Watnell Wireless Co.	29
Manchester Building Hardware Society, Ltd.	24	Battery Co.	109
Erewash Electrical Wire Co. ...	22	S. D. H. Manufacturing Co. ...	141
Turncock, G.	20	Corby Engineering & Wireless Co.	20

Deed of Assignment.—A. B. WAKELING and F. D'A. WRAY (Wakeling & Wray), electricians, 22, Paragon Street, Hull.—Particulars of claims by December 18th, to the Trustee, Mr. W. G. Hall, National Provincial Chambers, Silver Street, Hull.

The Scottish Lighting Bureau.—We reproduce herewith a group photograph of some of those who attended the 10th Illumination Design Course at the Scottish Electric Lighting

A Group at the Scottish Lighting Bureau.

Service Bureau, Glasgow, from November 24th to 26th. Mr. Bush, of E.L.M.A., Mr. Langlands, chairman of the Lighting Service Bureau, and Mr. H. E. Hughes, the district engineer, are in the centre of the picture. The Bureau is doing splendid work and the lectures and demonstrations are being well attended.

New Italian Companies.—Among the new electricity supply undertakings recently formed in Italy are the following:—La Società Elettrica Salentina, Bari, capital 100,000 lire; La Società Elettrica Marosticense, Marostica, capital 500,000 lire; La Società Imprese Elettriche de Santa Lucia del Mela, capital 97,000 lire; La Società Distribuzioni ed Utilizzazione Energia Elettrica "Interanna," Terni, capital 500,000 lire; La Società Produzione Elettrica "Ape," Polizzi Generosa, capital 360,500 lire; and La Società Imprese Elettriche Siculo-Lombarde, Milan, capital 100,000 lire.

A new company has been formed in Rome with a capital of 100,000 lire and the title La Società Vettura Auto-elettriche Italiane to construct electric motor vehicles.

Indian Electrical Imports. — In the course of a report which he has recently submitted to the Department of Overseas Trade, Mr. T. M. Ainscough, O.B.E., Senior Trade Commissioner in India, states that the imports of electrical machinery into India during the six months from April to September were valued at Rs.96 lacs, as compared with Rs.98 lacs in the equivalent period of last year.

Book Notices.—"Memorandum of the Chief Engineer of the Steam Users' Association for the Year 1924." Manchester: Taylor, Garnett, Evans & Co., Ltd.—In this publication a detailed report is given of the proceedings of the deputation which interviewed the Home Secretary to lay before him the views of the Steam Users' and Kindred Associations, with regard to the boiler section of the 1924 Factory Bill. Considerable information is given regarding recent introductions of apparatus and methods and observations made in combustion practice. The Ljungström-Howden preheater is described. The results of much research by the Association are recorded, including experiments on strains in various boiler parts.

"Wireless Annual for Amateurs and Experimenters." Pp. xv+179; illustrated. London: Iliffe & Sons, Ltd. Price 2s. 6d. net.—In this issue the space formerly devoted to special articles has been curtailed in favour of matter to which amateur radio-telephonists constantly need to refer. The list of amateur transmitting stations in all parts of the world is, we believe, the first of its kind published, and is as up-to-date as possible. The tabulated lists of regular transmissions, both in Morse and telephony, are also valuable for reference, and the sixteen pages of typical receiver diagrams, with notes, and information regarding valve characteristics, finding and rectifying faults in receivers, data and tables have been compiled by well-known men. Articles on the work of the International Broadcasting Bureau and a comparison of the broadcasting regulations and conditions in different countries of the world are included, while the glossary of technical terms, the list of wireless societies, the classified directory of manufacturers, and other useful information contribute to make this publication a handy book of reference.

"Miscellaneous Publications of the U.S.A. Bureau of Standards." No. 64. Price, 15 cents; and No. 68. Price, 5 cents. —The latter is an illustrated pamphlet showing the correct adjustment for motor vehicle headlights.

Social Events.—Callender's Anchor Cable Works Operatic Society (Leigh) attracted crowded audiences to the local Hippodrome recently, when it produced with marked success the Gilbert and Sullivan fairy opera, "Iolanthe." The opening night was under the patronage of the Mayor and Mayoress, who sent their hearty congratulations to the principals, chorus and orchestra. On the following Friday night, when the house was packed with school children, the opera was preceded, as a token of respect to the memory of the late Queen Mother, by the singing of two verses of her favourite hymn, "Abide with Me," followed after one minute's silence by the National Anthem.

The Belfast branch of the General Electric Co., Ltd., recently held a supper-dance as a send-off to the Magnet Social Club which the staff has formed. Advantage was taken of the occasion to present a grandfather clock to the manager of the Irish branches, Mr. W. R. E. Boyd, while Mrs. Boyd was given a dressing set. The Lord Mayor of Belfast, with his wife and daughter, Mr. G. B. Hanna, M.P. Parliamentary Secretary of the Northern Ireland Ministry of Home Affairs, Mr. J. L. Dawson, manager of the Belfast branch, and Mr. Johnston Wright, the city electrical engineer, were present at the function.

A Cooking Inquiry.—The following is a copy of a letter received by Mr. R. B. Mitchell, engineer and manager of the Glasgow Corporation Electricity Department:—

Since electricity's so cheap;
And gas so very dear,
I wish to know what I should pay
To get the big gas stove away
And do our cooking here
By electricity. Please say
Good Mr. Engineer.

Unemployment.—The number of unemployed registered at the Employment Exchanges on November 30th was 1,165,100, a reduction of 9,445 on the week. The figure was also 25,154 lower than that of a year ago.

The Finnish Electrical Market.—According to *Commerce Reports*, the use of household appliances in Finland has been gradually developing, and it is expected to become a considerably more important market in the future, particularly in view of the Imatra hydro-electric scheme. Although the native electrical engineering industry is being fostered, the bulk of specialised apparatus, including domestic appliances, is imported. German appliances have the greatest sale, but there are many Swedish manufactures on the market.

New Zealand Preference for British Goods.—The *Board of Trade Journal* states that the new Customs regulations, which are to come into force on April 1st next, provide that the following classes of goods shall receive the benefit of the British preferential tariff on importation into New Zealand:—(a) Goods wholly Empire produced, (b) goods wholly Empire manufactured from Empire materials, (c) goods wholly Empire manufactured from unmanufactured raw materials and/or such partly-manufactured materials produced outside the Empire as are permissible. In the case of goods not fulfilling these conditions, preference will be granted where 50 per cent. of the factory cost of the goods is represented by Empire labour and/or materials, provided that the final process of manufacture is performed within the Empire.

A Stoker Contract.—Harrington travelling-grate stokers, constructed by Riley Stoker Co., Ltd., of London, have been adopted for the new power station at Kirkcaldy, designed by Messrs. Kennedy & Donkin, consulting engineers.

An E.D.A. Film Display.—The British Electrical Development Association is arranging an exhibition of films dealing with various aspects of electricity at Australia House, Strand, W.C.2, on December 18th, between 7.30 and 9.30 p.m. Tickets for the event may be obtained from the director and secretary of the Association.

The Czecho-Slovakian Electrical Industry.—The *Board of Trade Journal* for December 3rd published a summary of the proceedings at a recent meeting of the Czecho-Slovak Federation of Industries. It is stated that the electro-technical industry had expected the realisation of an extensive electrification scheme in Slovakia. The scheme was, however, only partly carried out, and Slovak firms therefore had to look for markets in Bohemia, Moravia and Silesia, but they were unable to compete with Czech firms owing to the high freight rates and higher cost of production in Slovakia. The tariffs imposed by neighbouring countries also allowed little export trade to be done, but in spite of those difficulties, the industry had a normal year. The cable industry had a satisfactory year owing to the large number of orders from sugar factories, and as soon as the Housing Law is enforced a further improvement is expected. On the other hand, the proposed erection of several new telephone exchanges in Slovakia did not materialise and slow progress is being made in this direction.

A Swiss Company's Thirty Years. — The Motor Columbus Gesellschaft, of Baden, which has assisted financially in the establishment of electric power stations in Switzerland and many foreign countries, recently celebrated the completion of 30 years' existence. The concern has now a capital of 60 million fr.

Russian Orders for Germany.—According to German statements attributed to the president of the Russian State Electrical Trust, the latter has entered into an agreement with the Berlin A.E.G. under which the German company has offered on a favourable credit basis to supply machinery and other electrical manufactures of the value of 15,000,000 roubles. Negotiations of a similar kind are said to be in progress with the Osram Gesellschaft. It is added that the Trust will shortly send a Commission to Germany, England, France, and the United States in order to negotiate concerning equipment of the value of 5,000,000 roubles. Another report, also from German sources, states that the Donetz Coal Trust, the Southern Steel Trust, and the Southern Ore Trust have commissioned the Soviet Trading Delegation in Berlin to purchase electrical and mechanical installations for the extension of the works of these trusts. In this connection it is said that an agreement has been entered into with the A.E.G., the Siemens concern, and Brown, Boveri & Co. under which a postponement of payment would be granted for a part of the deliveries for a period of three years. In the case of the supply of winding-engine equipment and transport installations, difficulty is stated to have arisen owing to the scarcity of capital in Germany; as a consequence these particular orders have not yet been allocated. Negotiations by the Soviet delegation with regard to the sinking of new pits in the Donetz basin, as well as for the construction of dwellings for the Steel Trust, are said to be still pending.

Credit Information.—The Federation of British Industries has decided to organise a credit information service with the aid and for the use of its members. The main intention of the scheme is to "curb the activities of the fraudulent debtor, the debtor who is unable to pay, and also those of the buyer who adopts sharp or immoral business practices." It is proposed to issue a weekly list to members who notify their intention of assisting the service, and in every case of the receipt of information the name of the member reporting will be confidential.

Turbine Tenders in Norway.—Particulars have now been published concerning the tenders received last year for the supply of two turbines for the State hydro-electric works at the Nore and for the delivery of two further turbines this year. Last year the Norwegian A.S. Kvaerner Brug quoted 1,077,520 kr. for one machine and 1,002,520 kr. for the second, the highest guaranteed efficiency at an average fall being 86 per cent. The Myren Verksted tendered at 1,162,000 kr. and 1,092,760 kr., respectively. On the other hand, the German firm, which secured the order for the two turbines, quoted 659,360 kr. per machine, with an efficiency of 87 per cent. This year the Kvaerner and Myren works, which obtained the order for the two turbines, submitted joint tenders at 770,000 kr. and 750,000 kr. for the two, respectively, with an efficiency of 88 per cent. The amount of the German tender was 612,880 kr. with an efficiency of 88.5 per cent.

Unjustifiable Pessimism.—Speaking at a luncheon to inaugurate a "Buy British Goods" week in Birmingham recently, the President of the Board of Trade said that a great deal of the pessimism prevalent was unjustifiable. In many directions trade was improving and British capacity, initiative, and ability would pull us through.

At the same luncheon, the Labour Lord Mayor of Birmingham protested strongly against the practice of municipalities in awarding contracts to foreign firms because their tenders were a little lower than those of British manufacturers.

For Sale.—The Superintending Engineer, Henlow Aerodrome, Beds., invites offers for surplus generating plant, &c., at Bircham Newton Aerodrome, near King's Lynn. (See our advertisement pages to-day.)

New Czecho-Slovakian Company.—A new company has been formed in Reichenberg, with a capital of 200,000 crowns and the title Kontakta Gesellschaft, to manufacture electric carbons, contacts, and allied material.

New Belgian Company.—The Société Uranus d'Appareils Brevetés is the name of a new company which has lately been formed in Brussels, with a capital of 1½ million fr.

The Ten-Penny Shilling.—At the annual meeting of the Decimal Association last week the following resolution was passed unanimously:—

That the Government be urged to divide the pound sterling into 20 shillings of 10 pence instead of 12, in order to secure many advantages simultaneously, including:—

(*a*) A lower cost of living through a general restoration of "pennyworth" and "halfpennyworth" of full pre-war value.
(*b*) A lower cost of producing goods through this lower cost of living.
(*c*) Increased efficiency in home and foreign trading operations through an extended use of cheaper office machinery.
(*d*) Increased facilities in foreign trading through the establishment of the decimal system as the universal basis of all the coinages used throughout the world.
(*e*) Improvement of the present British coinage by gradual evolution instead of by the more revolutionary proposals hitherto considered.

The ten-penny shilling proposal has been unanimously approved by the Executive Committee of the Federation of British Industries, and will come before the Council of the Federation next month.

A Chilean Transformer Contract.—The *Manchester Guardian* reports that Messrs. Ferranti, Ltd., have secured an important order from Santiago, Chile, in the face of keen competition from United States manufacturers who have a firm hold upon the market. The order comprises two 13,333-kVA, 3-phase, 110,000-V transformers and several smaller units for use in connection with the electrification of the Chilean State Railways.

The British Empire Exhibition.—The financial loss on the Exhibition has been provisionally put at £1,581,905, and guarantors will be called upon for 15s. in the £ of their guarantees. The cost to the State will be in the neighbourhood of £800,000.

Wireless Retailers.—The Wireless Retailers' Association is about to issue a Handbook of 100 pages relating to its activities and other matters of interest to retailers.

Lighting and Power Notes.

Adwick.—LIGHTING CHARGES.—At the request of the ratepayers the Council formulated an electricity scheme, on which a sum of £30,000 has been spent. Recently it was announced that the weekly charge for an unlimited supply of electricity was 1s. 6d. for five points per house and 1s. 7½d. for seven points per house. Residents intimated that unless the charge was reduced by half they would not take a supply. At a recent meeting of ratepayers it was stated that the Council was counting upon 60 per cent. of the 3,500 houses taking electricity to make the scheme self-supporting. The principal opposition was to an all-the-year-round charge, meters being preferred.

Beckenham.—LOAN.—The Town Council is applying for sanction to a loan of £10,000 for mains and services.

Birmingham.—ELECTRICITY SUPPLY RECORDS.—The output at the Corporation power station during the week ended November 27th was 6,288,000 kWh, which established a record, being nearly 20 per cent. more than in the corresponding week of last year, and considerably above the highest weekly output during the war period. On a recent foggy day the output was nearly 1,200,000 kWh, a record for one day.

Birkenhead.—ELECTRICITY IN BULK.—The Electricity Committee has received a report from the electrical engineer upon a provisional offer received from the Wallasey Corporation for an increased supply of electricity in bulk to Birkenhead. The Town Clerk of Wallasey is to be informed that the Committee is prepared to recommend the Council to accept the offer.

Blackpool.—LOAN SANCTIONED.—The Corporation has received sanction to the borrowing of £12,000 for a 2,000-kW turbo-generator.

Bolton.—LOAN SANCTIONED.—The Electricity Committee has received sanction to borrow a further sum of £103,000 for plant extension and buildings at the Back of the Bank generating station.

Canada.—HYDRO-ELECTRIC DEVELOPMENT.—According to the *Electrical News*, the Algoma Power Co.'s plant at High Falls on the Michipicoten River has been purchased by the Chicago Edison Insull interests for a sum of $300,000. This plant comprises two units, one of 600 h.p., and one of 1,000 h.p. operating under an average head of 128 feet. The new interests will expend some $4,000,000 in the development of from 20,000 to 25,000 h.p., which will be available for the Goudreau and Michipicoten gold mining areas.

Work is reported to have started on a new paper mill costing $12,000,000 and a water power development costing $5,000,000 for the Canadian International Paper Co., Ltd., Three Rivers, Que. Both of these projects are on the Gatineau river.

Cheadle and Gatley.—LOAN.—The Urban District Council has applied for sanction to a loan of £3,280 for extending the mains to supply electricity to a new housing estate at Cheadle Hulme.

Colne.—"ASSISTED WIRING" SCHEME.—The borough electrical engineer has submitted a scheme to the Town Council in connection with the wiring of premises on the hire-purchase system. The scheme has been adopted by the Council and submitted for the approval of the Electricity Commissioners.

Continental.—SWEDEN.—It is reported that the proposal has been put forward for the formation of a company to supply electricity to the Island of Oland. It is proposed that power should be taken from the hydro-electric power stations on the mainland (probably Sydsvenska Kraft-A/B, Malmo) and transmitted by a h.p. submarine cable to Oland and further distributed to the different parts of the island by l.p. overhead lines.

BELGIUM.—Recently issued reports of the Société de l'Union des Centrales Electriques, of Brussels, state that good progress is being made with the linking up of the electricity supply undertakings in Belgium. The Union has now 24 sub-stations and nearly 80 miles of cables connecting up to 29 power stations belonging to 22 metallurgical, coal mining, tramway, and electricity supply undertakings. During the past year the exchange of electric power between distribution systems amounted to over 50 million kWh.

Criccieth. — ELECTRICITY SUPPLY. — The Urban District Council has notified the Gwynedd Trust of its intention to withdraw its support from the Trust's scheme for providing an electricity supply for the district, and to prepare an electricity scheme of its own.

Croydon.—MAINS EXTENSIONS.—The Electricity Committee has decided to extend mains at an estimated cost of £2,900.

Elland (Yorks.).—PURCHASE OF DOMESTIC APPLIANCES.—The Urban District Council has approved a proposal of the Electricity Committee to seek sanction to borrow £1,000 for the purchase of electric cookers, fires, &c., to be let out on hire.

Guernsey.—INAUGURATION OF SUB-STATION.—The new sub-station erected by the Guernsey Electric Light & Power Co. was formally inaugurated by Major-General the Hon. Charles Sackville-West, Lieut.-Governor of the island, on November 26th. Electricity is transmitted to the sub-station at a pressure of 6,000 V and reduced to 420 and 210 V d.c. for distribution.

Grimsby.—SUPPLY FOR "BEAM" STATION.—Upon the recommendation of the Electricity Committee, the Town Council has passed a resolution authorising the borrowing of £9,000 for the provision of cables and switchgear for supplying electricity to the "beam" wireless station, which the G.P.O. is constructing at Tetney.

Hastings.—INQUIRY.—Colonel T. E. Ekin, Inspector of the Electricity Commission, held an inquiry on November 24th and 25th into the application of the Corporation for a Special Order to supply electricity in various districts outside the borough, including Rye, Battle, and Ninfield. Mr. R. Harker, for the Corporation, stated that the Battle Urban District Council and the Hailsham and Battle Rural District Councils had given their consent to the proposed Order, and the borough of Rye had consented, subject to terms of an agreement. The Broomsgrove power station was capable of meeting the demands in the borough and Bexhill, leaving a substantial margin to be disposed of. Mr. R. Ferguson, the borough electrical engineer, stated that the capacity of the Broomsgrove station was 9,500 kW, and if further extension was required it would be possible to extend the system to 50,000 kW in an economical manner. He estimated the total supply to districts outside the borough at 702,869 kWh. Objections were raised to the scheme by the Hastings and St. Leonards Gas Co., the Southern Counties Electric Light & Power Supply Co., Ltd., the Commissioners of Sewers for the Rapes of Pevensey and Hastings, and Mr. P. Idle, for Mr. Bannister and 150 Hastings ratepayers. The Commissioners will give their decision in due course.

Helensburgh.—ELECTRICITY SUPPLY.—At the Dean of Guild Court the Clyde Valley Electric Power Co. was granted permission to erect a sub-station in connection with the town's electricity supply.

Hornsey.—The Housing Committee has recommended the wiring of 229 Council houses for electricity at a cost of £2,153. The following are the proposed weekly charges:—Nine points per house, 1s. 1d.; 8 points, 1s.; 7 points, 11d.; 6 points, 10d.

Irish Free State.—DUBLIN.—The Dublin Electricity Supply Bill has been further considered by the Free State Parliamentary Joint Committee, and it is announced that when the Committee's report has been presented it is the intention of the promoter, Sir John P. Griffiths, to hand the scheme over to the Free State Government free of cost.

WATERFORD.—The Corporation is taking steps to obtain a loan of £30,000 in connection with its electricity scheme. Of this amount £17,000 is estimated for providing mains, street lamps, services, and associated works, whilst the balance of £13,000 is for generating plant and accessories.

Lancaster.—ELECTRICITY IN BULK.—The Corporation has been in negotiation with the Carnforth Urban District Council regarding a supply of electricity to the district. The Electricity Committee proposes that for a bulk supply the Carnforth Council should pay £6 per annum per kW of maximum demand plus 1d. per kWh, together with 3½ per cent. per annum on the cost of the transmission line if erected by the Corporation; and that for a supply in detail the charges should not exceed 25 per cent. above the charges for the time being in force in Lancaster.

Leeds.—PROPOSED NEW POWER STATION.—The Corporation Electricity Committee is contemplating the erection of a new power station on the bank of the River Aire, where a site was acquired some time ago. The estimated cost of the work is £500,000, and the Committee is to approach the Electricity Commissioners for their sanction to the scheme.

London.—LEWISHAM.—The Board of Guardians has rejected a proposal to install its own generating plant and has decided to enter into a new agreement for seven years with the South Metropolitan Electric Light & Power Co., Ltd., for a supply at 1.25d. per kWh for the first 125,000 kWh, the charge to be reduced by a sliding scale to 1d. when the consumption reaches 250,000 kWh.

LONDON AND HOME COUNTIES JOINT ELECTRICITY AUTHORITY.—The Authority has established a Finance Committee, a Technical Development and Works Committee, and a General Purposes Committee, and has taken immediate steps to deal with questions referred to it under the statutes and the London Order regarding the establishment of the sliding scale of prices to be charged for electricity by the London Companies. It is hoped that the steps taken will enable the sliding scale to come into operation in January next in accordance with the desire expressed by the Electricity Commissioners. The Authority has also taken in hand the immediate consideration of applications for orders to supply in certain parts of the area and is giving special consideration to Parliamentary applications for the ensuing session.

Liskeard.—INAUGURATION OF SUPPLY.—The new power station of the Liskeard Gas and Electricity Co., Ltd., was formally inaugurated on December 1st by the Mayoress. The plant includes two 56/60-h.p. Vickers-Petters crude-oil engines, direct-coupled to two 36½-kW Crompton generators, with a D.P. battery of 470 ampere-hours capacity of 200 V. The scheme has been carried out under the supervision of Mr. H. Hill, consulting engineer and manager of the Bodmin Electric Light Co., and the total cost was approximately £6,000.

Lytham St. Annes.—LOAN SANCTIONED.—The Town Council has received sanction to the borrowing of £3,000 for mains and other works in connection with the supplying of electricity to the Lytham Shipbuilding & Engineering Co., Ltd.

Manchester.—PROGRESS DURING OCTOBER.—During the month of Octobor the Corporation electricity undertaking showed an increase in connections of 1,926 kW, bringing the total to 271,628 kW; and the number of applications received for supply, including existing consumers for additional supplies, was 1,190, representing a total of 3,543 kW. The number of consumers connected increased by 545, and the number of hired cookers connected by 81, bringing the total actually on circuit to 1,069. Applications for the hire of cookers totalled 118.

ELECTRICITY SUPPLY RECORDS.—On November 10th, the maximum supply demanded reached 129,230 kW and on November 20th the output reached 1,544,680 kWh, both figures creating records in the history of the undertaking.

LOAN SANCTIONED.—The Electricity Committee has received sanction to a loan of £160,000 for mains.

Middlesbrough.—FIRE DAMAGE.—Referring to the fire at the North Tees power station reported in our last issue, it was at one time during its course feared that the switch house would be gutted, and early reports which we quoted stated that this had actually occurred. We understand, however, that the oil which became ignited was oil contained in one of the switch tanks; only 200 gallons of oil was involved, and the damage to the switch house was confined to the immediate vicinity of the fire. No oil was stored in any of the power station buildings. Only two out of the twenty Reyrolle metal-clad switches installed in the switch-house were damaged as a result of the fire; the whole of the switchgear (with the exception of the panels affected) was put back into commission soon after the fire was extinguished, and the power station was dealing with the normal load within eighteen hours of the commencement of the outbreak. Supply to a large number of local consumers affected was provided from the company's other sources of supply within a very short period.

Rawtenstall.—ELECTRICITY CHARGE.—At the last meeting of the Town Council it was reported that in response to an inquiry as to the price at which the Corporation would supply electricity to the type of house in which it was proposed that nothing but electricity should be used, for heating, cooking, domestic power and lighting, the Electricity Committee recommended a charge of 1d. per kWh, with a suitable minimum payment per annum. The matter is receiving further consideration.

Retford.—ELECTRICITY SCHEME.—It was reported to the Town Council on November 27th that draft specifications and form of tender for an electricity supply had been received and that it was hoped to proceed with the scheme at once. If, as is suggested, an electric drive is required at the town's sewage works at Bollam, and also for the waterworks, the lay-out of the whole scheme will be affected, including the size of the generating plant, which is to be set up at the gas works.

Reunion.—HYDRO-ELECTRIC DEVELOPMENT.—At a recent meeting of the French Institution of Civil Engineers, M. L. Guerin gave particulars of the hydro-electric plant which it is proposed to establish on the Island of Réunion in the Indian Ocean. It is estimated that by means of three plants water power to the extent of from 50,000 to 60,000 kW can be utilised, a large portion of which could be used for the production of synthetic nitrate which is largely used in Réunion and is at present imported from Chile.

Salvador. — ELECTRICITY SUPPLY. — Engineers from the United States are studying plans to harness the waters of Lakes Guija and Ilopango to provide power for an electric lighting system to supply all the towns of Salvador.—*Reuter's Trade Service* (San Salvador).

Sheffield.—ELECTRICITY EXTENSIONS.—The Electric Supply Committee has approved extensions and works at an estimated cost of £5,865, and extensions to mains for general distribution purposes at an estimated outlay of £11,584.

South Africa.—PAARL (CAPE PROVINCE).—A meeting of ratepayers of the Municipality has authorised the raising of a loan of £5,000 for the purpose of making alterations and extensions to the existing electricity supply undertaking, and the signing of a ten years' contract with the Electricity Supply Commission for the supply of electricity to Paarl, subject to the Council obtaining contracts from consumers for 980,000 kWh per annum. The supply to be given by the Commission will be taken from the new power station in course of erection near Cape Town.

Special Orders.—The Electricity Commissioners have submitted to the Minister of Transport for confirmation Special Orders made by them authorising the Clacton Urban District Council to supply electricity in the parish of Little Holland; the Maidstone Corporation in parts of the rural districts of Maidstone, Malling, and Hollingbourn; and the Barrow-in-Furness Corporation in the urban district of Dalton-in-Furness and part of the rural district of Ulverston.

Application has been made by the Bridgend Urban District Council for a Special Order authorising it to supply electricity to certain parishes in the rural district of Penybont.

Tilmanstone.—ELECTRICITY EXTENSIONS.—The Tilmanstone (Kent) Collieries, Ltd., is to install plant with a capacity of at least 10,000 kW additional to its existing 2,000-kW station.

Torquay.—LOAN.—The Electricity Committee is applying for sanction to loans of £10,000 for mains and services, and £3,000 for renewals.

Ulverston. — INAUGURATION OF SUPPLY. — The electricity supply for the district was formally inaugurated on November 17th. Electricity is obtained in bulk from the Barrow Corporation.

Wrexham.—LOAN.—The Town Council has applied for sanction to a loan of £4,000 for an e.h.p. main, a low-pressure distributor, transformer, switchgear, and additions to buildings. The electrical engineer has been authorised to purchase electric cookers to be let out on hire.

York.—PRICE REDUCTIONS.—The Electricity Committee has recommended to the City Council that a reduction of the flat rate charge for lighting from 4¾d. to 4½d. per kWh be made, and that other charges be reduced 5 per cent., as from the September meter readings.

LOAN.—The Electricity Committee is seeking sanction to a loan of £15,000 for feeder cable extensions.

Tramway and Railway Notes.

Aberdeen.—SUBURBAN TRAMWAY PURCHASE.—According to the *Electric Railway and Tramway Journal*, a proposal to terminate the Town Council's present agreement with the Aberdeen Suburban Tramways Co. as to running powers in the city has been discussed by the Tramways Committee. A statement was submitted by the general manager, and it was agreed to recommend the Council to give six months' notice terminating the agreement. A letter was read from the Aberdeen Suburban Tramways Co. suggesting that the time might now be opportune for the Town Council to acquire the suburban tramways. The Committee decided to remit the letter to the Town Council for instructions.

Continental.—SWITZERLAND.—According to the 1926 budget of the Swiss Federal Railway Department, it is proposed during the coming year to increase the electric rolling stock by the addition of 155 locomotives and motor coaches. Contracts for 80 of the vehicles have already been placed.

Blackpool.—LOANS.—The Finance Committee has decided to apply for sanction to borrow £15,660 for the provision of 12 new tramcars, £8,268 for feeders and negative returns in connection with the Corporation Tramways Department, and £3,300 for the construction of an electric subway under the L.M. & S. Railway in the borough.

Halifax.—TRACK RENEWALS.—The Town Council has decided to apply to the Unemployment Grants Committee for assistance in connection with the proposed relaying of the tramway track from Tuel Lane Bottom in Wharf Street towards Halifax at an estimated cost of £2,295.

Heywood.—NEW ROUTE.—The Town Council has decided to co-operate with Middleton in the construction of a new tramway between Manchester Road, Heywood, and Hollins Lane, Middleton, to enable the Manchester Corporation, which will be granted a lease, to provide a through service of cars between Manchester and Heywood.

Liverpool.—PURCHASE OF UNDERTAKING.—The City Council, on December 2nd, approved of the acquisition by the Corporation of the Waterloo and Crosby tramways as from January 1st next. The proposed transfer provides that the Corporation, where practicable, shall lay forthwith and maintain a double track with a single or overlapping track where a double track is not practicable. The Corporation is to pay the district councils over a period of 21 years at the rate of £750 per annum until the land for widening is obtained, and afterwards at the rate of £1,100 a year. The fare under the Corporation management is not to exceed 2d. from Crosby to Seaforth with not fewer than three intermediate stages of 1d. each. These fares are to be maintained as long as the Liverpool fares are not increased. The number of passengers carried on the Waterloo and Crosby system in 1924 was 3,593,574 and the gross receipts amounted to £26,850, the expenditure £21,310, and the profit £5,540. It is estimated that there will be a saving in operating costs of nearly 3d. per car-mile, equal to £3,000 per annum, when the system is run by the Liverpool Corporation.

London.—NEW "UNDERGROUND" PLANT.—To meet the demand for the increased supply of energy which will be required for operating the new tube extension to Kennington and Morden, the Underground Company has taken steps to augment the existing plant of the Chelsea power station, and also at various points on the system. At Lots Road a third 15,000-kW turbo-alternator is being installed, and a fourth is on order. Two additional boilers, ten h.p. "group" switches, new circulating water strainers, oil filters, and two electrically-driven feed water pumps are also on order.

RECONSTRUCTION OF CHARING CROSS STATION.—A start is shortly to be made with the scheme for rebuilding Charing Cross underground station to enable it to deal with the increased volume of traffic which will arise when the Kennington extension opens next year. Contracts have been placed for the construction of the new subways and circulating area beneath the District Railway permanent-way and platforms. From this intermediate landing new escalators will lead down to the Hampstead platforms and also connect with the street. Contracts for this work have also been placed. The Charing Cross stations (District, Bakerloo and Hampstead) now cater for an annual traffic of 35,000,000 passengers. The new station will be capable of handling 50,000,000 passengers annually.

Salford.—THROUGH-RUNNING.—It was reported at a meeting of the Tramways Committee on December 1st that negotiations with the Bury Corporation for a service of through cars from Salford were approaching completion, and it was hoped that the service would be commenced about January 4th. The fare for the single journey will be 7d. It is intended that a reciprocal service shall be run by the Bury Tramways Committee to Salford.

South Africa.—RAILWAY ELECTRIFICATION.—A *Reuter* message from Cape Town states that it is hoped to complete the electrification of the 174 miles of railway from Glencoe to Maritzburg in Natal by March next. The electrification of the suburban lines in the Cape Peninsula, involving some 65 miles of track and comprising chiefly the Capetown-Simonstown line, is progressing, and it is hoped to have electric trains running in two years' time.

Telegraph and Telephone Notes.

Austria.—TELEGRAPH SERVICE.—The Government telegraph service recently introduced a system of "lightning messages" which are accepted for specially rapid transmission to any part of the country, also to Germany and Poland, at a charge nine times that of the ordinary rate. Another innovation is a reduced charge for telegrams containing over 60 words for transmission between stations provided with Hughes apparatus. On messages containing between 60 and 100 words a reduction of 20 per cent. on the ordinary rate is allowed; between 100 and 150 words, 30 per cent.; between 150 and 200, 40 per cent.; and over 200 words, 50 per cent.

Australia.—TELEPHONE SERVICE.—A speech by the Postmaster-General, in which Mr. Gibson reviewed the operations of his department, seems to show that normal conditions appear to have been reached with regard to telephone arrears; 5,000 new services are being added per month. In placing orders for supplies full advantage has been taken of opportunities offering to encourage Australian industries. Australian firms now are manufacturing nearly the whole of the wire and lead-covered cable used, to the value of £600,000 a year, and when to this is added the expenditure on such other commodities as insulators and conduit the annual amount expended by the department on local supplies is in excess of £1,000,000. The development of the telephone service has been marked in country districts, where the rate of increase is now higher than in the metropolitan areas.

Canada.—TELEPHONE SERVICE.—At the last census (1921) there were 11 telephones to every 100 of the population; the gross annual revenue per telephone (including all long-distance tolls and other charges) was £8 12s., compared with £9 13s. in the United States, and slightly above £10 in the United Kingdom. The actual cost for a private telephone installed in a residence is 11s. per month with unlimited calls. In the Prairie Provinces there are two rural telephones for every one urban.—*Reuter* (Ottawa).

At the beginning of the present year there were 1,083,964 telephones in Canada, as compared with 1,022,782 at the beginning of 1924. Next to the United States, Canada has the largest number of telephones in use *per capita*—one telephone to every nine inhabitants, as compared with England's one to thirty-seven.

China.—NEW RADIO STATION.—The Shansi authorities are constructing a wireless station at Hou Hsiao Ho Taiyuan, Shansi provincial capital. A number of experts and skilled mechanics have been engaged from Peking to carry out the work.

LONG-DISTANCE TELEPHONY.—A long-distance telephone service between Kalgan and Suiyuan, which had been under construction since last winter, was recently completed, and according to General Wu Te-ching, chief military engineer for the North-eastern Army and Manager of the Chinese Telegraph Administration at Shanghai, work was to commence on October 15th on the first long-distance telephone service in this part of China, connecting Shanghai and Nanking and also bringing within speaking range of Shanghai the cities of Soochow, Wusih, Shangchow, &c. It is hoped to have the line completed by January 1st, 1926. Another long-distance line stretching from Nanking to Tsinanfu, *via* Tientsin, was to be started simultaneously. The total cost of the lines from Shanghai to Nanking and from Nanking to Tsinanfu will be approximately $300,000. The rates charged for using the service will probably be $3.50 for five minutes' conversation between Shanghai and Nanking, $8 between Shanghai and Tientsin, and $4 between Tientsin and Mukden.

Marine Radio Operators.—STRIKE.—Representatives of several trade unions were present at a meeting of the Seafarers' Joint Council which was held last week in London to consider the strike of marine wireless operators. It is understood that the Wireless Operators' Union brought forward a resolution which the National Sailors' and Firemen's Union objected to and refused to discuss business until it had been withdrawn. The meeting was accordingly suspended.

The President of the Board of Trade informed the House of Commons that returns from the principal ports showed that up to December 4th (evening) 25 passenger ships and 124 cargo vessels had sailed without radio-telegraphists. Passengers had been warned of the suspension of the regulations requiring ships to carry operators.

Shetland-Iceland Cable.—CONCESSION RENEWED.—It is announced by the *Financial News* that the Great Northern Telegraph Co.'s concession for a cable from the Shetland Islands to the Faroe Islands and Iceland has been renewed, subject to the approval of the Icelandic Alting.

South Africa.—TELEGRAPH AND TELEPHONE DEVELOPMENT.—Mr. Thomas Boydell, Union Minister of Posts and Telegraphs, recently stated that since the present Government took office in June, 1924, nearly 10,000 miles have been added to the country's telegraph and telephone facilities, which fact, says the *British S.A. Export Gazette*, ought to impress upon British manufacturers the importance of the Government business likely to be on offer shortly in this connection. Official purchases of telephone and telegraph equipment in 1925 reached a higher figure than the £265,685 recorded in 1924, which was in its turn an advance on the £122,201 registered in 1923, and an effort is being made to add 3,000 miles to the farm telephone service before the end of the financial year in March. In 1924 British firms handled contracts to the value of £205,314 out of a total of £265,685, but both Swedish and German efforts to participate to a greater extent than formerly are very evident. There would appear to be little danger of Britain losing considerable ground, however, says the *Gazette*.

The Telephone Service.—DUTCH CABLE REPAIRED.—The submarine telephone cable to Holland, which broke about 10 miles from Aldeburgh (Suffolk) on November 17th, has been repaired. In spite of rough weather and heavy seas, the cable ship was able to find both ends of the broken line, and on December 3rd the eight telephone circuits contained in this cable were again available for use.

FIRE CALLS.—Statistics supplied by the London Fire Brigade show that out of 7,478 calls received in the London area, no fewer than 1,800, or over 24 per cent., were received through subscribers' or call-office telephones, which figures indicate the increasing use of the telephone for firm-alarm purposes, notwithstanding the fact that there are now 1,700 street fire alarms throughout the London Fire Brigade area.

Radio Notes.

Australia.—LICENCES.—According to the Postmaster-General, by the end of the first year of broadcasting operations, *i.e.*, August, 1925, nearly 70,000 listeners' licences had been issued, while for the year ended June 30th last the revenue amounted to £118,909.

Canada.—LICENCES.—The number of amateur wireless receiving licences issued for the nine months of the current year ended September 30th showed an increase of 7,823 over the previous year, making a total in use of 64,682. Ontario issued half the licences with a total of 32,833. The cost of each licence is one dollar per annum.—*Reuter* (Ottawa).

EDUCATIONAL.—A "University of the Air" is to be established by the Manitoba Agricultural College, in conjunction with the Manitoba telephone system broadcasting station at Winnipeg. According to Prof. Clark Hopper, a series of diploma courses will be instituted by the college, all instruction being given by wireless. Examinations will also be conducted by radio, and students who are successful will be given diplomas.

Daventry.—AERIAL MISHAPS.—The recent severe frost coated the aerial of the B.B. Co.'s high-power station (5 XX) with ice, the weight of which brought down some of the wires in the early hours of Saturday morning, December 5th. Temporary repairs were made, but during the night a further breakdown occurred; until repairs have been completed, the service will be maintained at reduced power.

European Wave-lengths.—OFFICIAL VIEW.—It is considered (by the *Radio Times*) undesirable that listeners should hold hopes of an improvement which has no possibility of being fulfilled for some time to come. Rather they should know definitely that the existing state of affairs must unfortunately continue during the present winter. No scheme satisfactory to all who must participate in it has been yet devised by which room can be found for 150 broadcasting stations in a wave-band which can only properly accommodate 100 stations. New proposals are being drafted, but they cannot be put into immediate operation. For the time being, therefore, no general alteration will be made in the wave-lengths of European broadcasting stations. Jamming between one station and another must get worse before it can become better.

BRUSSELS CONFERENCE.—The Co-ordination Committee of the Council of the International Radio-phony Union, assisted by engineers, will meet in Brussels on December 14th, when several plans for stabilising the European wave-length situation will be discussed, says the *Daily Mail*, which points out that the scheme drawn up at the last conference of experts, while excellent in theory, has proved entirely unsatisfactory in practice. At present one of the worst culprits is Toulouse, which on one occasion recently was found to have changed its wave-length six times in 24 hours.

Germany.—NEW STATION.—Frankfurt is erecting a new high-power broadcasting station which will be ready in February. This 10-kW station, says *The Times*, will be a considerable improvement on the present station, which is accommodated in the Post Office buildings. Frankfurt has at present 65,000 listeners, and arrangements were recently made to put crystal users in touch with foreign stations, which scheme has given much satisfaction.

RESTRICTION REMOVED.—The removal of restrictions on reception in occupied territory will give a new impulse to the radio industry in that district. The Post Office has not yet published an official statement, and doubt appears to exist as to the interpretation of the exemption. The ordinance of the Rhineland Commission of November 20th refers to the removal of restrictions on "wireless telegraphic receiving instruments." Listeners will be obliged to notify the police, who will have to supply a list of the names of users to the military authorities. Stations for broadcasting within the occupied zones continue to be prohibited.

India.—BROADCASTING COMPANY.—Last summer it was announced that applications for permits to establish a broadcasting company for India, together with applications for a separate company for Burma, would be received up to August 31st by the Director-General of Posts and Telegraphs, Wireless Branch. At the request of interested parties the last day for tendering was postponed to December 7th. There is reason to believe that tendering was confined to interests associated with the Indian Radio Telegraph Co., Ltd., which some time ago took over the Marconi interests in India, says *The Times*. The receiving licence is to cost not Rs.15 per annum, as at first suggested, but Rs. 10. Consequently the percentage payable to the broadcasting company has been raised to 15 per cent. Various suggestions have been made as to meeting the claim of the promoters that they should be permitted to create a second source of revenue in addition to the percentage, and it is now announced that applications will be considered which provide for the payment to the company, by importers, of a royalty on imported wireless apparatus. The duty on such apparatus was fixed some time ago at 2½ per cent., as compared with a general import rate of 15 per cent. Another question as to which negotiations have been taking place is the extent to which the broadcasting programme may be utilised for the publication of Government announcements and *communiqués*. Mr. McCarthy Jones has been selected to be the general manager of the Indian Radio Telegraph Co., Ltd., and is proceeding to India to take up his duties.

Italy.—NEW STATION.—The new broadcasting station at Milan was inaugurated on December 9th; it will work on a wave length of 320 metres for the time being.

The *Morning Post* draws attention to modifications recently introduced in the law controlling radio in Italy. Owners of receiving sets may pay the annual fee for the licence in monthly instalments of 8 lire (about 1s. 4d.), and where sets are installed in public places, or for purposes of gain, special contracts will have to be made with the broadcasting companies. Manufacturers of receiving apparatus must obtain from the Ministry of Communications a special permit, which costs 500 lire annually.

Radio material is to be taxed; for example, the tax on every valve will amount to 6 lire, on every crystal set 12 lire, on every loud-speaker 24 lire, and on every receiving set having one or more valves 36 lire, in addition to the tax on the parts already mentioned, the amounts being added to the buyer's invoice at the time of purchase. Ten per cent. of the taxation receipts go to the State, and 90 per cent. to the broadcasting company. Those who do not comply with the law are, in addition to the penalties laid down in the Penal Code, liable to fines of from 1,000 to 2,000 lire for all violations committed by manufacturers, merchants, and shopkeepers, and 200 lire where receiving sets are kept without a licence.

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Aberdeen.—December 16th. National Committee for the Training of Teachers. Electrical work in connection with two hostels and subsidiary buildings at Kittybrewster, Aberdeen. Specifications from Mr. J. A. O. Allan, architect, 25, Union Terrace, Aberdeen.

Ashford.—December 14th. Electricity Department. Concrete engine foundations, concrete cooling pond, reinforced-concrete road, steam and small electric circulating water pump, fuel-oil pump, oil-purifying plant, fuel-oil storage tanks, &c. (November 27th.)

Australia.—MELBOURNE.—April 12th, 1926. State Electricity Commission of Victoria. Plant for the Sugarloaf and Rubicon hydro-electric scheme, consisting of turbo-generators, transformers, switchgear, cranes, and accessory plant. (See this issue.)

Victorian State Railways. January 20th, 1926. Automatic battery-charging equipment.* January 13th. Double recording wattmeter.*

Banff.—December 14th. Town Council. Electrical work in connection with the new Town Hall. Specifications from Town Clerk.

Belgium.—December 30th. Belgian Ministry of National Defence, 10, Rue du Méridien, Brussels. Wireless telegraph apparatus for use on military aeroplanes. Particulars (Cahier des Charges Special, No. 636) for 4 fr., from 15, Rue des Augustins, Brussels.

Brentwood.—January 1st. Guardians of Billericay Union. Electrical wiring in conduit and installation of complete electric generating plant at the Institution, Billericay. (See this issue.)

Edinburgh.—December 14th. District Board of Control. Electrical and heating work at Bangour Mental Hospital new X-ray building. Specifications from Mr. J. D. Gibson, surveyor, 60, Frederick Street, Edinburgh.

January 4th, 1926 Electricity Supply. Two 1,200-b.h.p., 6,600-V, 3-ph. induction motors. (See this issue.)

Edmonton.—Education Committee. Wiring offices at Brettenham Road, Edmonton, for electric light. (See this issue.)

Folkestone.—Electric lighting and telephone installation at the Leas Cliff Hall. (See this issue.)

Leamington Spa.—December 17th. Corporation. Installation of electric light, electric bells, and wiring of motors at the Royal Pump Rooms. (See this issue.)

London.—ISLINGTON.—December 17th. Electricity Committee. One 75-kW a.c. motor and d.c. generator, with starters, switchgear, &c., and three 5,000-kVA Scott-connected transformers, &c. (November 20th.)

H.M. OFFICE OF WORKS.—December 18th. Electric wiring in conduit of the Western Annexe, &c., at the British Museum. (December 4th.

LONDON COUNTY COUNCIL.—December 31st. Renewal of the storage battery at Bexley Mental Hospital. (See this issue.)

Manchester.—December 30th. Electricity Committee. One single unit (or, alternatively, one double unit) three-phase induction regulator. (See this issue.)

New Zealand.—WELLINGTON.—February 16th. Outdoor switchgear for the Waikato electric power scheme.*
February 16th. Outdoor switchgear for the Waikato electric power scheme.*
AUCKLAND.—February 8th. Auckland Electric Power Board. Overhead cotton-covered triple-braided cable.*
February 22nd. 15-amp. cut-outs.*

Preston.—January 15th. Electricity Department. Supply and erection of approximately 15 miles of 33,000/45,000 V double transmission lines. (See this issue.)

South Africa.—JOHANNESBURG.—January 28th, 1926. S.A. Railways and Harbours. Eleven 4-ton electrically-driven wharf jib cranes and seven electric capstans for Durban Harbour. Secretary to the Tender Board, S.A.R. Headquarters, Johannesburg.*
UNION TENDER BOARD.—January 28th. Miscellaneous telegraph and telephone materials for the Department of Posts and Telegraphs.*

Uruguay.—February 23rd, 1926. State Electricity Supply Works. Porcelain insulators and accessories.*
D.c. and a.c. meters.*

Wakefield.—Installation of electric lighting at Outwood Council School, Stanley, near Wakefield. P. Beaumont, West Riding County Council Education Offices, 8, St. John's North, Wakefield.

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Accrington.—Electricity Committee. Accepted:—
Two years' supply of cable.—W. T. Glover & Co., Ltd.

Birkenhead.—Electricity Committee. Accepted:—
220 yd. low-pressure 4-core cable (£344).—Macintosh Cable Co., Ltd.

Bradford.—Tramways Committee. Accepted:—
Eight miles round copper trolley wire (£800).—Collier Bros. (agents for Thos. Bolton & Sons, Ltd.).
New No. 5 model 45-h.p. engine for motor tower wagon (£220).—Associated Equipment Co., Ltd.

Hornsey.—Electricity Committee. Recommended:—
Turbo-generator and condensing plant (£16,520); air filter (£213); Lea recorder (£210).—Brush Electrical Engineering Co., Ltd.

Hull.—Tramways Committee. Accepted:—
500 tons rails, 12 tons fishplates, and 7⅛ tons of sole plates (£6,037).—Bolckow, Vaughan & Co., Ltd.

Telephones Committee. Accepted:—
Bronze wire (£369); cable (£66).—W. F. Dennis & Co., Ltd.
Lead-in wire (£147).—London Electric Wire Co.
Switchboards (£190).—British L. M. Ericsson Manufacturing Co., Ltd.
Cable (£66).—W. F. Dennis & Co., Ltd.

The City Council, on Thursday last week, confirmed the recommendation of the Telephones Committee accepting tenders for German-made cable and wire. An amendment was moved that the lowest British tender should be accepted, and in the discussion a statement was made that the Hull Board of Guardians was paying £400 per week additional relief this year in consequence of unemployment. The reply was that it was ridiculous to argue that we should not trade with other countries. We must buy in the cheapest market and stimulate international trading.—*Manchester Guardian.*

Kilmarnock.—Ayrshire Education Committee. Accepted:
Installing electric light at a new special school.—William Johnstone and Son.

Leeds.—Waterworks Committee. Accepted:—
Electric motor and pump at Moortown reservoir (£208).—Mather and Platt, Ltd.

Tramways Committee. Accepted:—
150 electric equipments for new rolling stock (£85,000).—Metropolitan-Vickers Electrical Co., Ltd.

Electricity Committee. Accepted:—
Cable.—£2,748, W. T. Henley's Telegraph Works Co., Ltd.; £1,560, Macintosh Cable Co., Ltd.; and £1,095, Enfield Cable Works, Ltd.

Liverpool.—Tramways Committee. Accepted:—
New tramway works and car depôt in Edge Lane (£243,623).—W. Moss and Sons, Ltd.

London.—POPLAR.—L.C.C. Education Committee. Electric lighting at George Green school:—

A. Hawkins & Sons (Recommended)	**£559**
Malcolm & Allen, Ltd.	594
Commercial Telephone and Electrical Co., Ltd.	629
Star Electrical Co.	640
J. G. Sneath	698

UNDERGROUND ELECTRIC RAILWAYS CO. OF LONDON.—Additional plant for Lots Road power station.—According to *Modern Transport*, the third 15,000-kW turbo-alternator is being installed, whilst a fourth is on order. Main contractors for the turbines, C. A. Parsons & Co., Ltd.; sub-contractors for the alternators, Metropolitan-Vickers Electrical Co., Ltd.; condensers, W. H. Allen, Son & Co., Ltd.
HAMMERSMITH.—Electricity Committee. Accepted:—
Installation of reactors between the two- and three-phase switchboards (£465).—British Thomson-Houston Co., Ltd.
ADMIRALTY.—Accepted:—
Six Yarrow patent water-tube boilers (land type) with Yarrow superheaters for Portsmouth electric power station.—Yarrow & Co. (1922), Ltd.

Manchester.—Tramways Committee. Accepted:—
Copper trolley wire.—F. Smith & Co., incorporated in the London Electric Wire Co. & Smiths, Ltd.
Bronze trolley wire.—Elliott's Metal Co., Ltd.
Cadmium trolley wire.—Rd. Johnson & Nephew, Ltd.
Education Committee. Accepted:—
Rearrangement of electric lighting at Bangor Street school.—Ward and Booth; at Grange Street school.—Lancaster & Bowen, Ltd.
Electricity Committee. Accepted:—
Cable.—Johnson & Phillips, Ltd.

Oldham.—Electricity Committee. Accepted:—
Construction and erection of a new cable bridge across the railway at Greenhill.—Babcock & Wilcox, Ltd.

South Africa.—BULAWAYO, RHODESIA.—Municipality. Accepted:—
Three B. & W. 10,000-lb. boilers, with mechanical stokers, superheaters, and economisers, £14,000; two Belliss-Witton (G.E.C.) turbo-alternators, condensing plant and auxiliaries and engine room steel work, £13,130; one Yarway spray cooling plant, complete, £1,100; steam and auxiliary piping, including Cope's regulators for boilers, £2,000.—Reunert & Lenz, Ltd.
One Johnson & Phillips eleven-panel truck-type switchboard, complete (£1,328).—Bartle & Co.—*S.A. Mining and Engineering Journal.*

Spain.—MADRID.—Babcock & Wilcox (Spain) has obtained the order for eight electric cranes for the port works on the Guadalquivir.—*Reuter's Trade Service* (Madrid).

York.—Electricity Committee. Recommended:—
6,000-kW turbo-alternator, &c. (£18,998).—Oerlikon, Ltd.
Switchgear (£680).—Metropolitan-Vickers Electrical Co., Ltd.

According to the *Yorkshire Post*, it was stated at a meeting of the City Council that thirty tenders had been received from British, Swiss, French, Dutch, and Belgian firms. The lowest English tender was something over £24,000. Much of the material under the Oerlikon contract would be made in England; less than £7,000 would be spent in Switzerland. During a discussion the referring-back of the Electricity Committee's recommendation was proposed and defeated. A member of the Council said that the high rate of British tenders were due to the operation of "rings."

Forthcoming Events.

Institution of Mechanical Engineers.—Friday, December 11th. At the Institution, Storey's Gate, S.W. At 6 p.m. Papers on "Foundry Practice," by Mr. J. G. Pearce; and "Some Applications of Research to Modern Foundry Practice," by Mr. J. E. Fletcher.

Nottingham Society of Engineers.—Monday, December 14th. At the Victoria Station Hotel. At 7.30 p.m. Papers on "Buying of Second-hand Machinery," by Mr. M. A. Crosbie; on "Electric Vehicles," by Mr. A. O. Fawcett; on "Electricity *v.* Gas," by Mr. E. Mellon; on "Electric Welding as Applied to Boiler Repairs," by Mr. F. G. Skerritt; and on "Engineering in the Fire Service," by Chief Inspector Stokes.

Institution of Civil Engineers.—Tuesday, December 15th. At the Institution, Great George Street, S.W. At 6 p.m. Paper on a "Pressure-boosting Station for the Waterworks of the City of Montevideo," by Mr. A. Honeysett.

Society of Technical Engineers.—Wednesday, December 16th. At the Queen's Hotel, Birmingham. At 7.30 p.m. Lecture on "Some Present-day Needs of the Electrical Industry," by Mr. A. G. Ellis.

Edinburgh Electrical Society.—Wednesday, December 16th. At the Royal Scottish Society of Art, 117, George Street. At 8 p.m. Paper on "Radio-Telephony and Broadcast Receivers," by Mr. F. Boyd.

Radio Society of Great Britain.—Wednesday, December 16th. At the Institution of Electrical Engineers, Victoria Embankment, W.C. At 6 p.m. Annual general meeting. Paper, "Some Facts and Notions About Short Waves," by Mr. D. Sinclair.

Paisley Association of Engineers.—Tuesday, December 15th. At 16, High Street, Paisley. At 7.30 p.m. Paper on "Motor Breakdowns: Their Causes and Rectification," by Mr. T. T. D. Geesin.

Institution of Electrical Engineers.—Thursday, December 17th. At the Institution, Victoria Embankment, W.C. At 6 p.m. Paper on "The Power Losses in Magnetic Sheet Material at High Flux Densities," by Mr. C. E. Webb.

(Mersey and North Wales (Liverpool) Centre).—Monday, December 14th. At The University, Liverpool. At 7 p.m. Paper on "Post Office Wireless Stations," by Mr. E. H. Shaughnessey.

(North-Eastern Centre).—Monday, December 14th. At the Armstrong College, Newcastle-on-Tyne. At 7 p.m. Paper on "Recent Improvements in the Insulation of Electrical Machinery," by Lt.-Col. K. G. Maxwell and Mr. A. Monkhouse.

(North-Western Centre).—Tuesday, December 15th. At the Engineers' Club, Manchester. At 7 p.m. Paper on "An All-Electric House," by Prof. S. P. Smith.

(London Students' Section).—Wesdnesday, December 16th. Second annual dance.

(Sheffield Sub-Centre).—Wednesday, December 16th. At the Royal Victoria Hotel, Sheffield. At 7.30 p.m. Informal evening discussion on "Engineering Difficulties and How They Were Surmounted."

Birmingham Electric Club.—Friday, December 18th. At the Grand Hotel, Colmore Row, Birmingham. At 7 p.m. Annual meeting.

British Electrical Development Association.—Friday, December 18th. At Australia House, Strand. Display of electrical films.

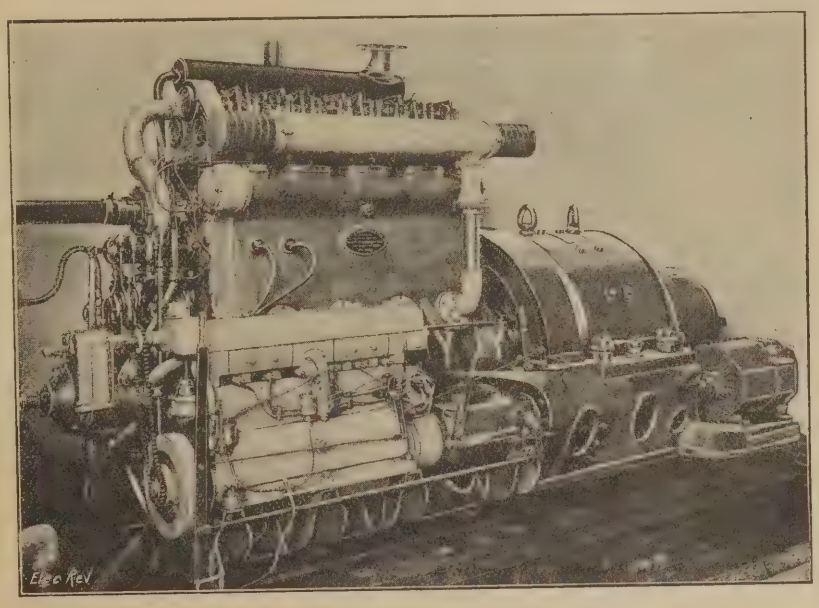
Junior Institution of Engineers.—Friday, December 18th. At E.L.M.A. Lighting Service Bureau, 15, Savoy Hill, Strand, W.C. At 7 p.m. Lecture on and demonstration of industrial and domestic electric lighting.

Manchester Electro-Harmonic Society.—Friday, December 18th. At the Albion Hotel, Piccadilly, Manchester. Smoking concert.

The "Electrical Review" Service Department.

INQUIRIES must be accompanied by a stamped addressed envelope.

We should be glad to learn the names and addresses of makers of the following:—
Heating moulds for bowler hat making.
A wooden lampholder adaptor, the top of which has two holes drilled to permit of flexible leads being taken out.
STAR signalling instruments.
Also we have an inquiry for the present address of Messrs. H. W. Butler & Co., late of Great Ormond Street.



Notes.

"Unchokeable" Ash Pumps.—In connection with the ent description of the St. Marylebone electricity generating nt, we have been asked to point out that Messrs. Blackstone i Co., Ltd., are the sole manufacturers of the "unchoke-e" ash pumps used in that station, each of which is capable handling 70 tons of ash per hour.

The Whitworth Society.—The third annual commemora-n dinner in memory of Sir Joseph Whitworth will be held 6.30 for 7 p.m. on Monday, December 21st, at the Holborn staurant, Kingsway, London, Mr. Wm. Sisson, president, in chair. Further particulars can be had from the Hon. Secre-y, Whitworth Society, Institution of Mechanical Engineers, rey's Gate, Westminster, S.W.1.

Diesel-Electric Railway Traction.—The success of the new itish light Diesel engine, specially designed by Messrs. Wil-m Beardmore & Co., Ltd., and built in one of their Glasgow rks, for the oil-electric cars recently introduced on the nadian National Railways, some details of which will be ind on p. 665 of our October 23rd issue, is attracting interest ongst railway engineers. The general problem to be solved is that of reducing operating costs on lines where the low nsity of traffic does not justify steam traction, and puts elec-fication out of the question owing to the capital outlay volved. It is generally felt that by putting into commission nucleus of nine cars—two of which are eady in service — the Canadian tional Railway has taken an impor-nt step towards its solution.

At the luncheon during the trial trip the first articulated car between Mon-al and Ottawa, Mr. C. E. Brooks, ief of the Motive Power Department, N.R., outlined a trip he made to weden and Great Britain to examine e possibilities of adapting oil-burning gines of the Diesel type to railway actice in Canada. Such engines were use in Sweden, but the space they cupied and their weight in relation to eir power-producing qualities were far o great to adapt them to service in anada. He found in the light aero gine in the Beardmore plant at Glas-w the basis for the engine which had en installed in the articulated car. The nearest approach to this engine," e continued, "weighs from three to ur times as much per horse power. Its ssibilities are great, provided we can aintain it reasonably. The fuel cost is uch lower than our expectation. We lt that if we could operate the small r at between 4 and 5 cents a mile for el, we would be satisfied. We have und that we are able to operate it at nder two cents a mile for fuel and, in me cases, we have come very close to one cent. Our tests ave proved that it compares very favourably with any other rm of transportation."

Diesel-Electric Railway Traction Plant.

The special features in favour of the oil-electric type of car re low cost of fuel oil, lubricating oil, and engine maintenance, niform acceleration, elimination of the roughness of operation nd high maintenance cost of heavy mechanical transmissions, acility of control from either end of the car, and operation f the engine under its most economical conditions by main-aining a constant load throughout a large variation in car peed. The accompanying illustration shows a 160-b.h.p. ngine and generator on test in the makers' Glasgow works; is fitted in the smaller type of car, which carries 56 passen-ers and luggage.

Further particulars of the feat of the new oil-electric car, hich crossed Canada from Montreal to Vancouver in 67 ours, show that two world's "records" were achieved, one or the fastest run for such a distance (2,937 miles), and the ther for the longest non-stop run ever made. The car left Montreal 16 hours after the C.N.R. fast "Continental imited," passed it at Winnipeg, and arrived in Vancouver 2 hours ahead of it, the steepest grades of the Rockies being limbed at an average speed of 40 m.p.h. From the time he car left Montreal until it reached Vancouver the engine ever stopped running.

According to *The Times*, five of the principal trunk line ailways entering New York City have ordered oil-electric ocomotives to displace the coal-burning locomotives. In a ecent test of fuel and lubrication, the cost of the steam locomo-ive showed itself to be more than six times the cost of the il-electric locomotive, which is operated as an internal-com-ustion engine using low-grade fuel oil. It is calculated that f all trunk lines employ oil-electric locomotives the railways' annual fuel bill can be reduced by $375,000,000 per annum.

Agricultural Hall Lighting.—CORRECTION.—In our Novem-ber 27th issue, in a note headed "The Public Works and Roads Exhibition," reference was made to the re-lighting of the Agricultural Hall and in connection with the new installa-tion the title of the Engineering & Lighting Equipment Co., Ltd., of St. Albans, was given in error. We apologise for the accidental omission of the words "Engineering &."

Electrical Power Engineers' Association.—ANNUAL DINNER.—The third annual dinner of the West Yorkshire Section of the Electrical Power Engineers' Association took place at the Great Northern Hotel, Leeds, on Saturday, December 5th. The chair was taken by Mr. A. J. S. Waddell, of Bradford, who, together with Mrs. Waddell, had held a reception of the guests, numbering over 150.

After the loyal toast, Councillor J. W. LONGLEY, chairman of the Bradford Corporation Electricity Committee, in proposing "The Association," said the E.P.E.A. was a body which he believed everybody in the electrical world appreciated. Bradford valued very much the help rendered by it in the difficult times through which they had to pass in that city. Members of such an Association could either make or mar the electricity industry, or the undertakings with which they were connected, and it was a pleasure to be able to state that in every respect its members appeared to feel themselves a part of such undertakings. The Association had spent some considerable time in drawing up a scheme for the training of apprentices. Everybody was agreed that nothing was more necessary than that apprentices should be given the finest and most thorough training possible, not only in the electrical world, but also the mechanical world.

Mr. A. L. LUNN, of Manchester, responded, and said they all felt proud of their Association. It was a fact that the members were more prosperous to-day owing to the efforts of the E.P.E.A., which had given them a standard of living more commensurate with their responsibilities. With regard to the training scheme, they all knew the rather hopeless way in which men had been trained in power stations in the past and that must never be repeated.

The toast of "The National and District Joint Boards" was proposed by Mr. THOMAS ROLES, electrical engineer and manager to the City of Bradford, who said that in Bradford they were very pleased that such Boards and the E.P.E.A. were in existence. No industry could expect to progress unless it could attract the right kind of man; and if only for the fact that the Association had been instrumental in raising the standard it had surely proved its worth.

In responding, Alderman WALKER, of Manchester, chairman of the National Joint Board, said that the Joint Boards had been able to bring about a scale of salaries which had proved acceptable to all parties, and after five or six years' working had gained the confidence and respect of both the employers and employed. If an adequate salary was paid, the right man would be obtained; low salaries resulted in a low level of service. With regard to the training scheme, it was essential that the training should be an all-round one to enable the lads to pass the A.M.I.E.E. examination, or its equivalent. A ground training in the power station or on the mains was not sufficient. Training in the general work of the undertaking should be given, together with an insight into the business organisation and the system of arriving at costs.

Mr. H. P. WADSWORTH, of Huddersfield, proposed "The Guests," and coupled with the toast the Press.

A musical programme, given by a party from Huddersfield, added to the pleasure of the proceedings.

Visit to Electricity Works. — Members of the Lancaster Chamber of Trade paid a visit to the Caton Road electricity works of the Lancaster Corporation on December 2nd, and the following night heard a lecture by Major G. C. Milnes, on "Electricity, its Production, Distribution, and Costing," in the Town Hall.

Appointments Vacant.—Boiler-house assistant engineer (£349) for the Kingston-upon-Hull electricity department; mains assistant (£156), for the Southport Corporation electricity department; plumber-jointer, for Ashford (Kent) U.D.C. electricity department; telegraph foremen (£400), cable jointer (£425), for the Government of the Gold Coast. (See our advertisement pages to-day.)

Local Societies.—On December 2nd, the Edinburgh Electrical Society paid a visit to the Department of Engineering, University of Edinburgh. A brief account of the buildings and equipment, illustrated by lantern slides, was first given by Prof. Hudson Beare, M.Inst.C.E., after which a tour was made through the various laboratories, the workshops, and the drawing office. Various tests and demonstrations were witnessed by the party, including steel bar tension and cement briquette tensile tests, and other tests on water wheels and turbines, &c.

A Turbine Wrecked on the Rand.—As we go to press it is reported in the daily papers that an explosion occurred at the Vereeniging power station of the Victoria Falls & Transvaal Power Co. on December 8th. The shaft of one of the A.E.G. (German) 10,000-kW turbine-driven generators broke, and the machine was wrecked, parts flying through the roof and in other directions. The other three generating sets were damaged, but it was hoped that they would be quickly set at work again. Fortunately no one was hurt. As all the stations of the company, of 216,000 kVA aggregate capacity, were fully loaded, the supply to the Rand mines was curtailed in the central area.

Electrical Association for Women.—The new Glasgow and District Branch at its first meeting enrolled over 50 members, and the Committee has already drawn up its first programme of activities, which include a visit to the Dalmarnock Power Station and a lecture on "Home Lighting." The secretary of the branch is Miss R. F. Kennedy, 251, Sauchiehall Street, Glasgow. The Association has arranged a lecture on electricity for the nurses at the Westminster Infants' Hospital during this month, which will be given by Miss E. E. Wilson, the chair being taken by Mrs. Leslie Gamage, deputy chairman and hon. secretary of the Hospital Appeal Fund. Members of the Association were to visit on December 8th a special display of "Sun Ray" radiators at 50, Oxford Street, London, when a short talk on "The Sun Ray Radiator and Sun Ray Applications" was to be given by Mr. A. F. Berry.

Finsbury Technical College.—In the course of the Streatfield Memorial Lecture, which was given at Finsbury Technical College on December 3rd by Mr. F. H. Carr, director of British Drug Houses, Ltd., under the chairmanship of Sir William J. Pope, the lecturer said that the college could no longer be continued, and in a few months it would close, in spite of the great purpose it had served. This would produce in many a feeling of deep disappointment, though they would remember that warm thanks were due to the City and Guilds of London Institute for its great work there for over 40 years When the laboratories and buildings of the college were vacated it was not impossible that the City and Guilds would assign them for the development of a college of chemical engineering. There was need for chemical engineering training on an adequate scale, and he believed that the council of the Institute would give favourable consideration to any scheme which offered reasonable prospects of success. He would look to the council named to appoint a delegacy consisting of representatives of the Institute, the Association of British Chemical Manufacturers, the Institution of Chemical Engineers, and others who might help in the realisation of that great purpose. With buildings and equipment privided, £10,000 per annum, *plus* fees from students, would probably maintain a College of Chemical Engineering.—*The Times.*

B.E.S.A. Publications.—The British Engineering Standards Association has just published the following new and revised specifications:—No. 42, 1925, Reciprocating Steam Engines for Electrical Purposes; No. 120, 1925, Gas Engines for Electrical Purposes; No. 211, 1925, Heavy-Oil Engines for Electrical Purposes, Diesel Type, Air-Injection; No. 212, 1925, Heavy-Oil Engines for Electrical Purposes, Surface-Ignition Type; and No. 213, 1925, Heavy-Oil Engines for Electrical Purposes, Airless-Injection, Cold Starting Type. The specification for reciprocating steam engines is a new edition of the original specification No. 42 issued in 1909. All the clauses have been modified and brought up to date and a number of additions have been made. The rating of the steam engine is specified as the load in b.h.p. assigned to it by the maker to satisfy the requirements of the purchaser and to comply with the specification: a margin of capacity of 25 per cent. above the rated output is called for. The cyclic irregularity has been defined and limits given, and the question of flywheel effect is dealt with. Steam and exhaust pressures, standard speeds, speed adjustments for paralleling and governing, and the equipment which is to form part of the standard engine are also given, together with appendices setting forth the particulars which should be supplied to the engine-maker and the particulars to be supplied by him.

The four specifications for gas engines and heavy-oil engines were prepared concurrently, and the aim has been to secure consistency and uniformity regarding the salient features as far as practicable. The rating in each case is defined as the load in b.h.p. which the engine can carry continuously for a period of 12 hours at its rated speed when working under the stated conditions of pressure and temperature, and in the case of gas engines, with gas of the given calorific value. The engine must be capable of developing for one hour, 10 per cent. above this rating. Clauses are also included regarding the selection of the size of engine required to suit the capacity of a specified generator; the cyclic irregularity and the question of flywheel; the permissible variation in speed for paralleling and governing; the allowance to be made when an engine is working under non-standard atmospheric conditions; gas or fuel consumption; and tests and standard equipment.

The Association has also issued two publications, one giving standard dimensions for dynamos, distributor mountings, starting motors, and dynamotors for automobiles (No. 5,031-503 1925), and the other containing similar dimensions for small couplings for internal-combustion engines (No. 5,035, 1925). The first includes four specifications for the over-all and other important measurements, which are useful to the designer when arranging the placing of the various accessories in the chassis. When universally adopted it will be possible to replace or interchange the various makes of these fittings without costly alterations. The second publication, or fifth specification, is also dimensional, and gives all that is necessary for interchangeability. The dimensions in each are given both in inches and millimetres. The new standards contained are based upon the provisional standards Nos. 15, 16, 17, 18, and 19 of the Society of Motor Manufacturers and Traders, Ltd., published in the Data Sheets of the Institution of Automobile Engineers. They were submitted to the B.E.S.A. for consideration and approval, and have now been issued as British standards.

Copies of these publications may be obtained from the B.E.S.A. Publications Department, 28, Victoria Street, London, S.W.1, price 1s. 2d. each, post free.

STANDARDISATION RULES FOR ELECTRICAL MACHINERY.—The revision of B.E.S.A. Publication No. 72-1,917, Standardisation Rules for Electrical Machinery, is now nearing completion. Early in the deliberations of the committee which has undertaken the revision it was decided to divide this publication into eight different parts, each part to be issued as a separate specification. Two parts have already been issued, namely No. 168, "Electrical Performance of Industrial Electric Motors and Generators with Class A Insulation," published in February, 1923, and No. 173, "Electrical Performance of Traction Motors (Direct-current Series Wound)," published in December, 1923. The B.E.S.A. now announces the publication of three further parts, as follows:—

B.S.S. No. 169, "Electrical Performance of Large Electric Generators and Motors (Load with Overload Rating).

B.S.S. No. 225, "Electrical Performance of Alternators of the Steam Turbine-driven Type."

B.S.S. No. 226, "Electrical Performance of Large Electric Generators and Motors (Continuous Maximum Rating)."

The temperature rises included in these three specifications were agreed at the meeting of the International Elctrotechnical Commission, held at The Hague last April. It is hoped to complete the three remaining parts of the revised publication, *i.e.*, Transformers, Rotary Converters, and Fractional Horse-power motors, early in the New Year.

Institution Notes.

Institution of Electrical Engineers.—WESTERN CENTRE.—A lecture, illustrated with lantern slides, on "Switchgear Developments During the Last 20 Years," by Mr. J. H. Thomas, M.I.E.E., Cardiff, of the technical staff of the General Electric Co., Ltd., attracted a large attendance at the South Wales Institute of Engineers, Cardiff, on November 30th. The meeting was presided over by Mr. J. W. Burr, borough electrical engineer, Swansea, and a discussion followed. The lecturer declared that this country was far ahead of the Continent and the United States with regard to switchgear for industrial and colliery work. It was in this direction that the most radical changes had taken place in modern times. Development had been so rapid with regard to high-pressure work that the standardisation of a great many important classes of gear had been impossible, and any attempt at standardisation would have retarded progress. Regulations had been drawn up, but without a recognised testing authority they led to misinterpretations and sometimes mis-statements. Valuable work, however, had been done by Sheffield University in testing colliery switchgear designed to be explosion-proof, and also by the British Engineering Standards Association, but certain gear which had been standardised was almost obsolete. Rules and regulations, which were sometimes unnecessarily severe, increased the cost of overhead lines and switchgear. In industrial and colliery work, particularly on the surface, a good deal of expensive oil-break gear was installed which was not really necessary.

SCOTTISH CENTRE DINNER.—A representative company of 300 attended the annual dinner of the Scottish Centre of the Institution in Glasgow on December 2nd, at which Prof. Magnus MacLean, D.Sc., LL.D., presided. Lord Blythswood toasted "The Institution of Electrical Engineers." Mr. R. A. Chattock, in reply, said Glasgow had to be congratulated on being one of the first cities to establish an Electricity Service Bureau, an organisation for educating the public to use electricity properly. The Institution, he said, was now adapting itself to the needs of its 12,000 members, and he thought it was unfortunate that a proposal had been made to establish an institution independent of the Institution of Electrical Engineers for radio engineers. He felt it was quite unnecessary, and it was bad policy to divide the interests of the profession in that way, which must lead to overlapping and ultimate chaos. It was quite possible, of course, that wireless might be developed to a greater extent than it was at present, and might supplant their own distribution methods, and they must keep an eye on it and watch developments to see if it could be fitted into their new

siness. The establishment of another institution in con-ction with fuel economy had also been mooted. A more necessary suggestion he had never heard made. Here, o, they were vitally interested, and would be glad to scuss the question and explore it jointly with mechanical gineers.

Institution of Lighting Engineers.—LEEDS CONFERENCE XPENSES.—At Leeds City Council, on December 2nd, Sir harles Wilson, chairman of the Finance Committee, pro-sted vigorously against the expenditure of £327 in enter-ining delegates at the annual conference of the Institution Leeds, in September. He moved that expenses in con-ction with conferences of organisations concerning public dministration be not incurred without first obtaining the nction of the Finance Committee. The resolution was conded by Councillor Stanley Horrell, and Alderman G. itcliffe, chairman of the Leeds Gas Committee, vigorously posed the proposition. He contended that the Street Light-g Sub-Committee had full authority by resolution for the penditure incurred, and said the hospitality at Leeds was rsimonious in comparison with that at Glasgow the previous ar. After further discussion the resolution was withdrawn, the understanding that in future entertainment estimates ould be presented to the City Council beforehand.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.)

The Edinburgh Tramways Committee has decided to recom-end that the salary of Mr. F. A. FITZPAYNE, deputy tramway anager, be increased next May to £850 per annum and to 900 in the year following.

The Hornsey Council Electricity Committee recommends pay-g the borough electrical engineer the sum of five hundred ineas for the extra duties undertaken by him in connection ith the extension of the plant, and a sum not exceeding £500 those members of his staff, in such proportions as may be etermined, who have also carried out extra work involved by ie extension scheme.

The Bristol Corporation Salaries Committee recommends in-easing the salary of Mr. PROSSER, the sales manager of the ectricity department, from £600 to £700 per annum.

With reference to the shooting of Mr. LEONARD JOHNSON, Cor-oration traffic manager of Birmingham, by John Henry uttler, a chief inspector of the tramways, the latter was on aturday last charged at the Birmingham Assizes with at-empted murder. Evidence was given for the defence to show iat the revolver was not intentionally discharged and the jury eturned a verdict of not guilty either of intent to murder or cause bodily harm.

Mr. O. G. LEE, of the Liverpool Post Office service, has been ppointed telephone district manager at Southampton and has arted his duties there. He entered the service in the days f the National Telephone Co., and rose to the position of elephone contracts manager in Liverpool.

The Doncaster Electricity Committee recommends Mr. E. oss, of Tynemouth, for appointment as sales engineer in the orporation Electricity Department, at a commencing salary f £300 per annum, rising to £350, by annual increments of 25.

Mr. H. C. HEAD-JENNER has resigned his position as director f the Sheffield relay station of the British Broadcasting Com-any, and is succeeded by Major T. H. HOWARD. Mr. Head-enner is about to commence business in Sheffield as a wireless xpert.

Mr. R. C. HALL has resigned the position of municipal elec-rical engineer at Riversdale, South Africa. His address is Oakleigh, College Road, Rondebosch, Cape Province.

Mr. J. W. WILKINSON, A.M.I.E.E., M.A.Min.E.E., has been ppointed sales and export manager to Electrical Utilities, Ltd.

Obituary.—MR. W. H. BAUGHAN.—The death occurred on November 23rd of Mr. W. H. Baughan, one of the pioneers f the British electrical industry. He commenced business at harlbury (Oxon) in 1876, making electric bells, telephones, ndicators, lightning conductors, &c. His products were sold n large quantities to the leading London and provincial houses nd a sound export trade was done. All the components had o be made in Mr. Baughan's own factory and the coil winding vas done by hand. Later, Continental competition was felt nd the business developed on contracting lines with an inde-endent connection. Mr. Baughan retired in 1905 in favour f his son, Mr. A. H. V. Baughan, M.I.E.E., and the latter ubsequently turned the business into a limited company, etiring in 1918.

MR. H. GRIFFITHS.—Mr. Harry Griffiths, A.M.I.E.E., dis-rict engineer at Newcastle-on-Tyne to the Metropolitan-Vickers Electrical Co., Ltd., was the victim of a fatal accident on De-ember 4th, when a transformer which was being installed at he premises of the Co-operative Wholesale Society, Blandford Street, fell upon him. Previous to joining the Metropolitan-Vickers Co., Mr. Griffiths was chief electrical engineer to the Caledon Shipbuilding Co., Dundee, for several years.

MR. H. W. MORLEY.—We regret to learn that Mr. H. W. Morley, for many years managing director of Messrs. Cole, Marchent & Morley, Ltd., of Bradford, passed away last month at Northampton at the age of 59 years. Previous to his connection with the above company Mr. Morley had held appointments with Messrs. Hick, Hargreaves & Co., of Bolton, and with Mr. Wilson Hartnell at Leeds.

MR. C. GEEN.—The death occurred at Newton Abbot, on November 28th, at the age of 85 years, of Mr. Charles Geen, who had for over 26 years been managing director of the Lynton and Lynmouth Electricity Co. Mr. Geen initiated the supply of electricity for Lynton and Lynmouth, and the business was later made over to the present company.

MR. E. WILKINS.—The death occurred, on November 25th, of Mr. Edmund Wilkins, of Bilston, who had for upwards of 25 years been engaged at the Mount Pleasant depôt of the Midland Electric Corporation for Power Distribution, Ltd. He was 68 years of age.

New Companies Registered.

Sydney Hellyar, Ltd. (210,101).—Private company. Registered December 3rd. Capital, £2,000 in £1 shares. Objects: To carry on the business of electrical engineering contractors, general, mechanical, constructional, marine and civil engineers, manufacturers, importers and exporters of and dealers in electrical, magnetic or galvanic and motor engines, &c., to adopt an agreement with S. Hellyar and J. L. Shearme. The first directors are:—H. S. Marquand, Northwood, Woodcote Road, Leigh-on-Sea, electrical contractor (permanent chairman and governing director); J. L. Shearme, 29, Merton Avenue, Chiswick, W.4, electrical contractor. Qualification, 10 ordinary shares. Secretary: H. S. Marquand. Registered office: 4, South Place, E.C.2.

B.S.A. Radio, Ltd. (210,069).—Registered as a private company on December 2nd with a nominal capital of £2,000 in £1 shares. Objects: To carry on the business of manufacturers and factors of and dealers in all kinds of apparatus, articles and accessories used in connection with electrical and other transmission and reception of words, sounds, symbols, drawings, photographs and pictures, whether with or without conductors, and any other use for which wireless electricity may be applied or adapted, electrical engineers, &c. The subscribers (each with one share) are:—J. H. Rice, 81, Oxford Road, Moseley, Birmingham; and G. J. Withington, The Gables, Francis Road, Stechford, Birmingham, accountant. The first directors are Sir Hallewell Rogers, Percy Martin, and Willoughby L. B. Baylay. No qualification required. Remuneration, £50 each per annum (chairman, £250). Solicitors: Pinsent & Co., 6, Bennetts Hill, Birmingham.

H. and S. W. Thomas Co., Ltd. (210,074).—Private company. Registered December 2nd. Capital, £2,000 in £1 shares. Objects: To acquire the business of electric lighting now carried on by "H. Thomas and S. W. Thomas" at Saundersfoot, Pembrokeshire. The first directors are:—H. Thomas, 1, Bellevue, Tenby; S. W. Thomas, Delphi, South Parade, Tenby. Qualification, 100 shares. Secretary and solicitor: F. E. L. M. Thomas, Tenby House, Tenby. Registered office: 1, Bellevue, Tenby, Pembrokeshire.

Electro Acoustics, Ltd. (210,052).—Private company. Registered December 2nd. Capital, £250 in £1 shares. Objects: To carry on the business of electricians, electrical engineers and contractors, mechanical engineers, machinists, metal workers, tool makers, wood workers, suppliers of electricity for purposes of light, heat, motive power, telegraphy, telephony or otherwise, manufacturers of and dealers in amplifiers, condensers, detectors, magnetos, &c. The first directors are:—E. J. E. Bean, The Spinney, Pollards Hill North, Norbury, S.W.16; F. H. Burgess, 69, Braxted Park, Streatham Common, S.W.16; C. W. Nadal, 60, Meath Road, Ilford, Essex. Secretary: C. W. Nadal. Solicitors: Headley, Dalzell and Dickinson, 8, Stone Buildings, Lincoln's Inn, W.C.2. Registered office: 175a, Peckham Park Road, S.E.15.

Haydey, Ltd. (210,077).—Private company. Registered December 2nd. Capital, £500 in £1 shares (425 "A" and 75 "B"). Objects: To acquire the business of a manufacturer of wireless sets and accessories carried on by Maude A. Adey at 5, Great Peter Street, Westminster. The subscribers (each with one share) are:—J. G. Hay, 20, North Audley Street, W.1, retired officer; H. W. Adey, 10, Lambolle Road, Hampstead, electrical engineer. Lt.-Col. J. G. Hay is sole director, and may retain office for life. Solicitors: Williams and Poole, 106, Fulham Road, S.W.3. Registered office: 5, Great Peter Street, S.W.1.

The Gretna and District Electricity Supply Co., Ltd. (13,897).—Registered in Edinburgh as a public company on November 30th, with a nominal capital of £15,000 in £1 shares. The objects are to take over part of the business of electricity supply carried on by H.M. Factory, Gretna, in the Counties of Dumfries and Cumberland. The first directors are:—P. M. Carlyle, The Gables, Gretna, medical practitioner; J. S. Wise, 86, The Rand, Eastriggs, Dumfries, electrical engineer; T. C. Tatnall, 101, Annan Road, Gretna, merchant; J. W. Matthew, The Crescent, Eastriggs, Dumfries, mechanical engineer; J. S. Moir, Gordon House, Gretna, Dumfries, surveyor; J. Elliot Millar, 3, The Ridge, Eastriggs, Dumfries, retired; G. Ritchie, Central Avenue, Gretna, stationer. Minimum cash subscription, £4,000. Qualification, 200 shares. Secretary: J. Hutcheon. Registered office: 58, Annan Road, Gretna.

Ashley Wireless Telephone Co. (1925), Ltd. (210,014).—Private company. Registered November 30th. Capital, £2,500 in £1 shares. Objects: To carry on the business of wireless telephone and telegraph engineers, manufacturers of wireless apparatus, &c. The subscribers (each with one share) are:—H. Dewhurst, 40, Tynwald Hill, Stoneycroft, Liverpool, electrical engineer; W. A. Brooke, 45, Pilkington Road, Southport, radio engineer. The first directors are to be appointed by the subscribers. Qualification, £50. Secretary: J. V. Underwood. Solicitor: T. G. Henry, 11, Lord Street, Liverpool. Registered office: 24, North John Street, Liverpool.

Pyramid Products, Ltd. (210,042).—Private company. Registered December 1st. Capital, £1,000 in £1 shares. Objects: To acquire the business of a wireless electrical engineer carried on by Francis Addie at 4, Cornbrook Place, Stretford, Lancs. The first directors are:—F. Addie, 90, Derby Street, Moss Side, Manchester, electrical engineer; J. H. Burrows, The Bungalow, Witham Road, Woodhall Spa, Lincs., engineer (life directors). Qualification, 1 share. Secretary: F. Addie. Registered office: 4, Cornbrook Place, Chester Road, Manchester.

Selfix Electric Co., Ltd. (210,024).—Private company. Registered November 30th. Capital, £1,000 in £1 shares. Objects: To acquire the business belonging to R. E. Robson and W. F. T. Pinkney, initiated by them in connection with the electrical illumination, lighting, power, equipment, heating and other electrical agencies, and to carry on the business of electricians, electrical and mechanical engineers, &c. The directors are:—R. E. Robson, "Greenside," Linden Avenue, Gosforth; W. F. T. Pinkney, 3, Douglas Avenue, Gosforth; H. S. Bird, 58, Grey Street, Newcastle-on-Tyne. The said R. E. Robson shall be permanent so long as he holds 25 ordinary shares. Qualification of directors, 25 ordinary shares. Secretary: N. B. Ridley. Solicitors: W. C. Soden-Bird, 58, Grey Street, Newcastle-on-Tyne. Registered office: 32, Grainger Street West, Newcastle-on-Tyne.

Official Returns of Electrical Companies.

Belling & Lee, Ltd.—Particulars filed of £2,000 debentures authorised November 21st, 1925, charged on the company's undertaking and property, present and future, including uncalled capital, if any, the amount of the present issue being £1,500.

Kirby (Wimbledon), Ltd. — Debenture dated November 23rd, 1925, to secure £1,000, charged on the company's undertaking and property, present and future, including uncalled capital. Holders: C. H. Benmore, 16, Pembroke Square, W., and W. T. Greenland, 8, Dunmore Road, Wimbledon, S.W.

Oco Electrical Appliances, Ltd.—Debenture dated November 18th, 1925, to secure £750, constituting a specific charge on the company's land in London and all other freehold, leasehold and copyhold properties and a floating charge on the company's undertaking and other property, present and future, including uncalled capital. Holders: Branch Nominees, Ltd. 15, Bishopsgate, E.C.

Greenwich Cable Works, Ltd. (formerly New Gutta Percha Co., Ltd.).—Satisfaction in full (*a*) on June 11th, 1925, of mortgage, registered charges, and collateral charge and registered charge, all dated July 10th, 1924, securing £2,000; and (*b*) on October 27th, 1925, of mortgage and four registered charges, all dated September 12th, 1921, securing £2,000. (Notices filed November 27th, 1925.)

Landis & Gyr, Ltd.—Deed of covenant dated November 11th, to secure all moneys to become payable to the mortgagees under a building agreement dated October 13th, 1925, charged on certain land in Victoria Road, Acton. Holders: Edwards Construction Co., Ltd., 17, Throgmorton Avenue, E.C.2.

Sterling Telephone & Electric Co., Ltd. (101,415).—Capital, £65,000 in 49,650 preference and 15,350 ordinary shares of £1 each. Return dated September 7th, 1925. 39,500 preference and 15,350 ordinary shares taken up. £24,500 paid. £30,350 considered as paid. Mortgages and charges, £125,000.

Calcutta Tramways Co., Ltd. (14,764). — Capital, £1,400,000 in 700,000 ordinary and 700,000 preference shares of £1 each. Return dated June 23rd (filed September 17th), 1925. 700,000 ordinary and 250,000 preference shares taken up. £764,900 paid. £185,100 considered as paid. Mortgages and charges, £350,000 4½ per cent. first debenture stock and £250,000 7 per cent. second (registered) debentures.

H. L. Wood & Son, Ltd.—Particulars filed of £2,500 debentures authorised November 17th, 1925, charged on the company's property, present and future, including uncalled capital, the amount of the present issue being £1,500.

Electric and General Investment Co., Ltd. (31,506).—Capital, £201,500 in 19,900 preference and 20,000 ordinary shares of £5 each and 40,000 deferred shares of 1s. each. Return dated July 24th, 1925. All shares taken up. £121,500 paid (being £5 per share on the preference, £1 on the ordinary, and 1s. on the deferred shares). Mortgages and charges, £8,547 10s.

Sheerness and District Electric Supply Co., Ltd. (65,749).—Capital, £75,000 in £1 shares. Return dated June 18th (filed September 15th), 1925. All shares taken up. £75,000 paid. Mortgages and charges, nil.

Electric Supply Corporation, Ltd. (52,036).—Capital, £350,000 in 200,000 ordinary and 150,000 preference shares of £1 each. Return dated April 9th (filed June 11th), 1925. 150,000 ordinary and 150,000 preference shares taken up. £279,000 paid on 129,000 ordinary and 150,000 preference shares. £21,000 considered as paid on 21,000 ordinary shares. Mortgages and charges, nil.

Chepstow Electric Lighting & Power Co., Ltd. (70,646).—Capital, £10,000 in £1 shares. Return dated April 29th, 1925. 5,510 shares taken up. £1,537 paid. £3,905 considered as paid. £68 in arrears. Mortgages and charges, £3,000.

Yorkshire Switchgear & Engineering Co., Ltd. (formerly the T. S. Switchgear & Construction Co., Ltd.) (93,698).—Capital, £10,000 in £1 shares. Return dated August 4th, 1925. 5,332 shares taken up. £5,332 paid. £3,000 considered as paid. Mortgages and charges, £4,914 1s. 3d.

General Electric Co., Ltd. (67,307).—Capital, £6,000,000 in £1 shares (1,800,000 "A" preference, 1,800,000 "B" preference, and 2,400,000 ordinary). Return dated July 22nd (filed September 9th), 1925. 1,800,000 "A" preference, 1,800,000 "B" preference, and 2,111,975 ordinary shares taken up. £4,690,149 paid on 1,575,540 "A" preference, 1,777,109 "B" preference, and 1,337,500 ordinary shares. £1,024,826 considered as paid on 224,460 "A" preference, 22,891 "B" preference, and 774,475 ordinary shares. Mortgages and charges, £3,387,500.

Sun Electrical Co., Ltd. (63,261).—Capital, £100,000 in 50,000 ordinary, 20,000 preference, and 30,000 preferred ordinary shares of £1 each. Return dated November 13th, 1925. 25,062 ordinary, 17,141 preference, and 21,076 preferred ordinary shares taken up. £63,279 paid. Mortgages and charges, £16,217.

Tramways Syndicate, Ltd. (58,292).—Capital, £2,500 in £1 shares. Return dated June 3rd, 1925. 1,507 shares taken up. £7 paid. £1,500 considered as paid. Mortgages and charges, nil.

Peter Curtis, Ltd. — S. W. Rowland, of 296-302, High Holborn, W.C.1, C.A., was appointed receiver and manager on November 25th, under powers contained in debenture dated February 18th, 1925.

City Notes.

Reports and Meetings of Electrical Companies, Dividend Results, &c.

International Automatic Telephone Co., Ltd.

An extraordinary general meeting of this company is called for January 5th next at Winchester House, E.C., to consider a number of resolutions. Among these, resolution (1) provides that the capital of the company shall be increased by the creation of an additional 640,000 shares of £1 each to be issued as ordinary shares conferring the same rights as, and ranking *pari passu* with, the 360,000 ordinary shares of £1 each now issued; and resolution (2) provides that the contract of December 2nd, 1925, made between the company and Messrs. Theodore Gary & Co. for the cancellation of the option granted to Messrs. Gary to purchase the ordinary shares in the company at £1 10s. per share be ratified and confirmed. A separate meeting of the holders of ordinary shares will follow the special meeting. The reasons why the resolutions have become necessary are explained at length in a circular issued by the directors to t ordinary and deferred shareholders. The company was form in 1920 with powers to invest in companies manufacturing te phone, telegraph and other electrical apparatus; to engage the manufacture of this apparatus; and to own and oper telephone, telegraph, wireless or cable companies in any p of the world. The company acquired the control of the Au matic Telephone Mfg. Co., Ltd., and entered into an agre ment with that company for the promotion of sales of Strowg automatic telephones in colonial and foreign territories, a secure for it a substantial amount of foreign business sufficie to establish mass production and a regular output over a peri of years. This arrangement has been satisfactory to both co panies. In view of the development of the telephone and ele trical industry throughout the world and in order that the co panies shall participate freely in this development, it is thoug desirable to create additional capital. On the formation of t company an option was given to Messrs. Theodore Gary & C Kansas City, U.S.A. (who were mainly responsible for securir to the company the contracts providing for the large amount business referred to above), so long as they continued to ho 10,000 deferred shares in the company, to purchase from t shareholders all or any of the preference shares of the compan at 21s. 6d. per share plus accrued dividend, and all or any the ordinary shares at 30s. per share. This option has no become valuable and its removal would be beneficial to t shareholders and facilitate the expansion of the company capital on a favourable basis. As a result of negotiatio Messrs. Gary & Co. have agreed to accept an option to purcha from the company if, as and when issued, 360,000 of the 640,0 new ordinary shares which it is proposed to create, at 30s. p share, and to abandon their option on the existing and issue 360,000 ordinary shares. The provisional contract will only b come effective subject to the passing of the special resolutio already mentioned. Certain trade investments have alread been made and other investments are in process of negotiatio It is expected that these investments will in all necessitate th issue from time to time of approximately 140,000 new ord nary shares, leaving the balance (500,000) available to be issue as occasion may arise. Under the present capitalisation th voting power of the ordinary and deferred shares is equal; i is proposed to maintain this position under the new capitali sation and the resolutions make provision for certain of th deferred shares conferring on the holders the requisite rights

Cape Electric Tramways, Ltd.

The report for the year ended June 30t shows a profit of £85,209, and after provid ing for debenture interest and redemption and adding the balance brought forward there is £66,461 available. From this a sum of £20,000 ha been placed to reserve and £2,500 has been set aside to form the nucleus of a staff benefit fund. It is proposed to pay final dividend of 4 per cent., free of tax, making 7 per cent for the year, and to carry forward a balance of £9,576. Th number of passengers carried and the gross receipts both de creased to a small extent owing to the general depression pre vailing in South Africa. It is stated that an improvement se in during the last few months of the year. The 6 per cent first mortgage debentures have been redeemed, and arrange ments have been made to extend the period of the 5 per cent debentures, the interest being increased to 6 per cent. Neithe the Cape Town nor the Port Elizabeth municipalities has given notice to exercise its rights of expropriation of the tram way system under the terms of the concessions. The meeting is to be held on December 16th.

Burmah Electric Tramways and Lighting Co., Ltd.

Mr. C. O. Webb, chairman, presided at the annual meeting on December 2nd, and in presenting the report and accounts (which were reviewed in our last issue, p. 909), stated that, although, generally, trade had been bad in Mandalay throughout the year, it was satisfactory to note that the gross receipts had increased; the items making up the working expenses showed a decrease, with the exception of maintenance and repairs to permanent way, overhead equipment and cars. It had to be remembered that the system was 20 years old, and until considerable expenditure was incurred in renewals, the cost of maintenance would remain heavy. The lighting and power business which had been built up in Mandalay promised to outstrip the tramways in gross receipts, and it was a more profitable undertaking. It was probable that within the next few years it would be necessary to expend a considerable amount in improving the distribution system and renewing the permanent way and cars, but the company had sufficient funds in hand to meet these charges. The chairman referred to the proposed change of the company's title to the "Burma Electric Supply Co., Ltd.," which, it was considered, better described the company's business. The report and accounts were adopted, and at a subsequent extraordinary general meeting the change of the company's name was approved.

Edison Swan Electric Co., Ltd.

The report for the year ended June 30th, 1925, states that the year's trading results have been satisfactory, and the accounts show that, after making provision for the redemption of debenture stock, the profit for the year amounts to £88,344, to which has to be added a balance of £17,575 brought forward, making £105,919, which the directors recommend should be applied as follows:—7½ per cent. dividend on preference shares, £7,500; 10 per cent. dividend on ordinary shares, £19,143; transfer to reserve fund, £50,000; leaving £29,276 to be carried forward. The directors recommend a special grant of £5,000 to the chairman and managing director, Mr. C. F. Spencer, in recognition of the

exceptional services rendered by him during the past three years, to which the present satisfactory position of the company is in a large measure to be attributed. A resolution to this effect will be submitted to the meeting which is to be held on December 16th.

French Companies. The *Société pour l'Equipement Electrique des Véhicules* reports net profits of 2,705,000 fr. for 1924-25, as compared with 2,445,000 fr. in the previous year, and it is intended to increase the rate of distribution from 45 fr. per share for 1923-24 to 50 fr. for the past year.

The directors of the *Compagnie Générale d'Electricité* recommend the payment of a dividend at the rate of 70 fr. per share for 1924-25.

British Insulated & Helsby Cables, Ltd. — At an extraordinary meeting held on December 4th, under the chairmanship of Mr. J. Taylor, a resolution was approved authorising the capitalisation of a part of the company's reserves and issuing it in the form of ordinary shares to the existing shareholders in the proportion of one new share to each three held. The chairman said that shareholders who were entitled to fractions of shares would receive the benefit of this from the sale of the aggregate of such shares in the market.

Amalgamated Wireless (Australasia), Ltd.—There was a net profit of £5,036 upon the working during the year ended June 30th last, as compared with a net loss of £21,857 in the preceding year. The work in connection with two duplex "beam" stations for direct service with Great Britain and Canada is progressing, and it is hoped to have them completed early next year. The broadcasting business was satisfactory, as was the marine section, apart from the effects of the shipping dispute.

American Loan for the A.E.G.—The *Financial News* states that negotiations are proceeding in New York between representatives of the Allgemeine Elektricitäts Gesellschaft and the National City Bank for the issue of a second series of convertible bonds. It is believed that this series will be issued on a 6½ per cent. basis.

Stock Exchange Notices.—Dealings in the following have been specially allowed by the Committee under Rule 159 :—

Coventry Chain Co., Ltd.—90,000 ordinary shares of £1 each, fully paid, Nos. 310,001 to 400,000; 100,000 new ordinary shares of £1 each, fully paid, Nos. 400,001 to 500,000.

International Telephone and Telegraph Corporation.—$2,146,200 capital stock in shares of $100 each.

Kaministiquia Power Co., Ltd. (Incorporated October 1st, 1925).—£200,000 5½ per cent. first mortgage sinking fund, registered debenture stock of Series A.

Bullers, Ltd.—The report for the year ended July 31st last shows a profit of £21,984 (an increase of £3,060), and the addition of the sum brought forward makes available £26,253. After meeting the preference dividend and transferring £5,291 to the debenture sinking fund, it is proposed to pay a final dividend of 2½ per cent. on the ordinary shares (making 5 per cent., free of tax) and to carry forward £5,665.

Manaos Tramways and Lighting Co., Ltd.—The receipts for the year ended April 30th last showed a further increase, and after meeting expenses there was a net operating revenue of £7,956 (the milreis being valued at 6d.). After adding interest, &c., and deducting debenture interest and London expenses, there remains a balance of £5,686, which has been transferred to the renewals reserve.

Marconi's Wireless Telegraph Co., Ltd.—In accordance with the provisions of the trust deed, between the company and the Law Debenture Corporation, Limited, dated November 17th, 1922, for securing the 6½ per cent. convertible 10-year first debenture stock, the company has this year applied the sum of £75,000 in purchases in the market of debenture stock.

Foundation Co., Ltd.—Out of a profit of £14,165 for the year ended June 30th last, plus £4,603 brought forward, a dividend at the rate of 8 per cent. is being paid on the cumulative participating preference shares, and £11,679 is being carried forward.

Major & Co., Ltd.—Out of a profit of £23,960 (including £9,650 brought forward) the directors are paying the dividends on the 6 per cent. and 8½ per cent. preference shares and carrying forward £12,459. They regret their inability to recommend dividends on the preferred ordinary and ordinary shares.

Petters, Ltd.—The company's funding scheme has been approved by the High Court, and the certificates are being prepared.

An interim dividend has been declared on the 7½ per cent. cumulative preference shares.

Reduction of Capital.—*Mann, Egerton & Co., Ltd., and reduced.*—A petition has been presented to the High Court for the confirmation of the reduction of the capital of the company from £400,000 to £370,925, and will be heard in London on December 15th.

Anglo-Argentine Tramways Co., Ltd.—The following dividends are announced :—2s. 9d. per share on the 5½ per cent. cumulative preference shares; and 3s. per share on the 6 per cent. cumulative second preference shares.

Ruston & Hornsby, Ltd.—It is reported that the directors have decided to postpone the payment of the interim dividends on the 5 and 6 per cent. preference shares.

New Issue.—*Newcastle-upon-Tyne Electric Supply Co., Ltd.*—The recent issue of ordinary shares was over-subscribed.

Castner-Kellner Alkali Co., Ltd.—The company has declared a dividend of 14 per cent. (making 22 per cent. for the year, as in 1923-24); £70,636 has been placed to reserve, and £28,008 carried forward.

S. Smith & Sons (Motor Accessories), Ltd. — The net profit for the past year amounted to £55,652, and to this was added £23,494 brought forward, making £79,146. In view of the present financial position of the company, the whole of this has been put to reserve.

Great Northern Telegraph Co., Ltd.—An interim dividend of 5 per cent., less tax, has been declared.

Stocks and Shares.

MONDAY EVENING.

FIVE per cent., to which the Bank Rate was raised last Thursday, is deemed to be a fair working minimum, and one which seldom imposes any serious check upon Stock Exchange business at a time when the public are ready to buy and sell securities. That there would have to be a rise before Christmas, common consent had agreed, and, this being the case, a putting an end to suspense was rather welcomed than otherwise. Stock Exchange prices are no worse, and the rubber boom paid no attention to the hint that money would be more expensive at next week's settlement.

International Automatic Telephones jumped another 6s., to 42s., before the reason for the recent advance became revealed in the issue of a circular to the shareholders. We had pointed out that an American firm, Theodore Gary & Co., had an option over the ordinary shares at 30s., at which price the firm could have called them from the present proprietors. This it was which made the rise to £2 so mysterious. The company announces that the option will be cancelled by Gary & Co. in exchange for another option, also at 30s., that will give the firm the call of 360,000 new shares, at 30s., out of 640,000 shares which it is proposed to create. Meetings are to be held early in January to consider and to pass the resolutions necessary to give effect to the increase now proposed in the capital, and to modify the existing contract with Gary & Co. Upon the announcement of these particulars, the price reacted to 39s. 3d. per share.

Automatic Telephones are 9d. higher at 52s. 9d., and these are the only changes which have occurred in the telephone group.

Johnson & Phillips at 54s. 6d. are quoted ex the right to apply for the new shares at 40s. Holders of five old shares can take up one new share at £2, and the last day for sending in acceptances is Thursday in this week, December 10th. Those who have the right to do so should make a point of seeing that they secure the bonus thus offered them : too many people are apt to toss away any papers which ask for the remittance of money. The rights can be sold at about 13s. if allottees do not wish to take up their proportion of new capital.

Lancashire Electric new ordinary, issued at 22s. 6d., and the new preference, which came out at 23s. 6d., are an active and a good market on the basis of 2s. 1½d. premium. Yorkshire Electric new are being negotiated on the basis of 29s. 6d. Newcastle new ordinary, with 5s. paid, attract a good deal of business on the basis of 1s. 7½d. premium. Several other new issues are in the air, as being likely to appear between now and the fast-approaching end of the year. Clyde Valleys have risen a florin to 29s. 6d.

Chelsea Electrics put on 2s. 6d. to 2⅛, a compliment to the appointment of Mr. P. D. Tuckett to the company's board. City Lights are the main feature of strength in this market, the price being 5s. up at 52s. Several vague reports purport to provide the explanation for this big rise. Possibly a humdrum reason may be found in the wide difference which had been existing between the price of City shares and that of County ordinary. The latter maintain their strength at 58s. 3d.

Edison Swans are rather better at 8s. 9d., the report showing a satisfactory increase of £13,400 to £88,300, in the net profits for the year that ended on June 30th last. While the dividend remains at 10 per cent., the appropriations to carry forward, &c., are increased. Metropolitan-Vickers gained a few pence to 27s. 6d., on the excellent contracts which the company is acquiring. A fall of 1/16th lowered Siemens to 33s. 9d. People have been selling these in order to put the money into rubber shares. Brush shares are better at 26s. 3d.; English Electrics drooped to 19s. 9d. Iron and steel shares are dull, falls of small amount being frequent throughout the list. This served to bring about a sympathetic decline, to 2 9/16, in Babcock and Wilcox.

Cable securities are unusually quiet. Western Telegraphs recovered the 5s. dividend deducted last week from the price. Anglo-American deferred is once more ⅛ higher. Indo-Europeans have been marked down as low as 43½, although the nominal quotation is left unchanged at 45½. Marconis have failed to recover, and Canadians fluctuate narrowly around 5s. 3d. Burndept Wireless have been dull upon the coming to market of a fair line of the preferred shares.

The Home Railway list is uninteresting. Districts strengthened to 47½. Underground £10 paid shares are lower at 2⅛. The public attention paid to Home Railway stocks is lukewarm. The rubber market's attractions are blamed for this, as they are for many other falls in these days. The boom in rubber shares attained, to-day, Monday, an intensity of fury which constituted a record, up to the present, for this particular market.

Exhibition of the Physical Society of London and the Optical Society.—This exhibition, which is to be held on January 5th, 6th and 7th, 1926, at the Imperial College of Science and Technology, Imperial Institute Road, South Kensington, London, will be open in the afternoon (from 3 to 6 p.m.), and in the evening (from 7 to 10 p.m.).

Mr. J. E. Barnard, F.R.S., will give a lecture on "The Search for Ultra-Microscopic Organisms," at 8 p.m. on January 5th; Professor A. F. C. Pollard, A.R.C.S., A.M.I.E.E., will give a lecture on "The Mechanical Design of Instruments" at 8 p.m. on January 6th; and Major W. S. Tucker, D.Sc., will give a lecture on "Electrical Listening" at 8 p.m. on January 7th. These lectures will be illustrated by lantern slides and experiments. Some 70 firms will exhibit scientific apparatus, and in addition there will be a group of non-commercial exhibits by Fellows of the Societies and others, including demonstrations of famous historical experiments in physics, recent physical research, and effective lecture experiments.

It has been decided to open the exhibition to the general public on the third day, January 7th. On January 5th and 6th tickets of admission will be required.

We understand that invitations relating to January 5th and 6th have been given to the Institution of Electrical Engineers, the Institution of Mechanical Engineers, the Chemical Society, the Radio Society of Great Britain, the Röntgen Society, the Faraday Society, and other scientific bodies. Members of such Societies should apply for tickets to the Secretary of the Society to which they belong. Others interested should apply directly to Professor A. O. Rankine, Imperial College of Science and Technology, South Kensington, London, S.W.7.

The Work of the Electricity Commissioners.

The Fifth Annual Report.*

(*Continued from page* 915).

Re-organisation of Electricity Supply.

At the end of the period covered by the report, schemes for he improvement of the organisation for the supply of elec-ricity in six electricity districts had come into force. Four f these schemes came into operation during the previous year, he two additional schemes being in respect of the East Mid-ands Electricity District and the Edinburgh and Lothians Electricity District.

A noteworthy feature of the past year was the conclusion of he proceedings before the Commissioners in connection with he re-organisation of supply in the London and Home Counties electricity district, which had occupied their atten-ion throughout a period of four years.

Since the coming into force of the North Wales and South Cheshire Electricity District Order, the North Wales Power Company has pressed forward actively with the establishment f the transmission scheme, and the marked progress already nade has not only resulted in the supersession of local gene-ation at a number of centres owing to the availability of bulk upplies, but has also stimulated a number of applications for pecial Orders for distribution powers in new areas capable f being developed by means of supplies from the transmission ystem.

On July 8th, 1924, the Commissioners made an Order con-tituting the Edinburgh and Lothians Electricity District and n December 16th, 1924, the Order came into operation. A nap is given showing the approximate boundary of the dis-rict as finally determined, and the engineering features of the listrict. The generating stations in existence or sanctioned at March 31st, 1925, have a capacity of 52,785 kW, of which Porto-ello accounts for 40,000 kW.

A new draft Order and Scheme for the London and Home Counties Electricity District was published by the Commis-sioners on March 31st, 1924. A local inquiry was held on May 5th, 1924, and following days, and on July 17th, 1924, the Commissioners made an Order constituting the Electricity District and establishing the Joint Electricity Authority.

The Minister of Transport caused a public inquiry to be held on March 9th, 1925, into the representations made to him dur-ing the confirmation proceedings, and confirmed the Order on May 20th, 1925, with certain amendments. The Order came into force on July 29th, 1925. A map is given showing the approximate boundary of the Electricity District finally deter-mined and the engineering features of the district. Particu-lars of the generating stations of authorised undertakers in the district are set out in a table, together with figures showing the capacity in kilowatts.

The total capacity of the generating plant installed and/or sanctioned at March 31st, 1925, amounted to 1,139,232 kW, divided between local authority and company undertakers in the approximate proportions of 43 per cent. and 57 per cent. respectively.

Under the Technical Scheme scheduled to the District Order, the stations denoted by a triangle on the map may be regarded as suitable for extension so as ultimately to form principal generating stations. The remaining stations in existence at March 31st, 1925, are denoted by squares on the map, the majority being classified in two main categories in the Technical Scheme.

The main transmission and interconnecting lines in existence or sanctioned at March 31st, 1925, are denoted by full lines on the map. The Technical Scheme provides that the additional mains shown in dotted lines on the map may be regarded as required during the first stage of development for the purpose of making effective use of the generating plant in the district and of supplementing the existing interconnecting and bulk supply mains.

The West Midlands Electricity District comprises a part of the district provisionally determined by the Commissioners, in 1920, as the North West Midlands Electricity District. Events led to the subdivision of the originally contemplated district and to the renaming of a portion thereof.

An interim local inquiry was held by the Commissioners at Wolverhampton on October 21st, 1924, after which the Commissioners prepared a draft Order embodying an approved scheme for the southern area, which was renamed the West Midlands Electricity District. The scheme provided for the exclusion from the area of supply of the Shropshire, Worcestershire and Staffordshire Electric Power Company of so much of the said area as was within the district, and in consideration for such exclusion conferred upon the Power Company powers to supply electricity for all purposes in certain other portions of the area of supply under the Company's Power Acts.

The Technical Scheme provided for the utilisation of certain specified generating stations; for the early erection, in sections, of a new capital station at Ironbridge; for the subsequent erection, in sections, of a further capital station at Rugeley, and for the establishment of various transmission lines.

The Local Inquiry into the approved scheme was held in December, 1924, and the Commissioners, in April, 1925, made the Order and submitted it to the Minister of Transport for confirmation.

The West Midlands District provides the only instance, among all the districts hitherto dealt with by the Commissioners, where the full support of all the local authority and company undertakers concerned has been forthcoming both to the establishment of a Joint Electricity Authority and to the transfer of the generating stations in the District to the Joint Authority. Moreover, the District provides the first instance in which there was concurrence on the part of a power company to exclusion from a District under the machinery provided by the Act of 1922 in consideration of the granting of powers to supply for all purposes in other portions of the power company's area of supply.

At the commencement of the period covered by the Report, the draft Order and Scheme for the West Riding (Aire and Calder) Electricity District was in course of settlement by the Commissioners, and the Yorkshire Electric Power Company was taking the necessary steps to secure the assent of Parliament to the introduction of a late Bill to give effect to certain heads of the settlement arrived at between the Power Company and the other principal parties in the District during the course of the local inquiry held in February, 1924. The Power Company obtained the necessary assent, and the Commissioners held a conference at the end of April with the principal parties and their Counsel.

Following the decision of a Committee of the House of Lords in July that the Power Company's Bill should not be allowed to proceed, the Commissioners reviewed the position in consultation with the principal parties, with the object of determining whether the scheme could be rendered effective without supplemental legislation.

On May 22nd, 1925, the Company notified the Commissioners that Counsel had advised that the scheme could not be carried out in the manner proposed so as to give the Company the security which would have been provided had the Bill and District Order been confirmed; and that the directors had reluctantly come to the conclusion that no useful purpose would be served by pursuing the matter further.

The Commissioners held a local inquiry at Glasgow in April, 1924, into a scheme for the West of Scotland Electricity District, but after consideration of the evidence put forward and having regard to the possible alteration in the circumstances as the outcome of the developments outlined by the Government in July, 1924, decided to defer issuing any pronouncement upon the submitted scheme.

As the outcome of the proceedings in connection with the reorganisation of supply in the North-West Midlands Electricity District, and following the decision of the Commissioners to deal separately with the southern and northern portions of the District the Commissioners issued a notice in December, 1924, provisionally determining the northern portion as a separate District under the name of the North-West Midlands Electricity District, and providing for the submission of a scheme.

The adjourned local inquiry into the draft Order and Scheme for the Mersey and West Lancashire Electricity District was not resumed, and no material progress was made with the scheme of reorganisation during the year. The Commissioners were influenced by the circumstances previously referred to and refrained from taking active steps to bring about a settlement between the parties in the District. For similar reasons, in connection with the reluctance of the Corporations of Sheffield and Rotherham to accept the establishment of a Joint Authority for the North-East Midlands Electricity District, the Commissioners decided to defer consideration of the matter pending a decision by the Government as to its policy with regard to electrical development generally.

General Observations.

In view of the investigations on the question of the further development of electricity supply in Great Britain which were in progress on behalf of the Government at the date to which the report is made, the Commissioners have felt it unnecessary to make any comments upon the general course of the proceedings before them during the past year in connection with the reorganisation of supply.

It is recorded, however, that the Commissioners have made representations to the Minister of Transport with a view to the removal by further legislation of various limitations and difficulties which have hitherto been found to preclude effective and expeditious action.

Co-operation.—In part 6 of the "Electrical Educator" (Pitman) there is a brief article by Mr. D. N. Dunlop on "Co-operation in the Electrical Industry."

A Review of the Electrical Industry.

By A. G. ELLIS.

(*Abstract of Chairman's Address*: NORTH-WESTERN CENTRE *of the* INSTITUTION OF ELECTRICAL ENGINEERS.)

(*Concluded from page* 914.)

On the Chester Corporation system there are some 15 miles of 3-phase, 6,600-volt overhead line, with 13 open-air sub-stations, stepping down to 400/230 volts and supplying 20 miles of 4-wire overhead distribution lines. The area served is about 70 square miles, and already nearly 600 consumers are connected, representing a load connection of 952 kW.

On the Mid-Cheshire system, with its centre at Northwich, there are in use or under construction 21 miles of overhead 3-phase transmission line at 33,000 volts, covering an area of 120 square miles and designed to feed three towns (Knutsford, Winsford and Middlewich) and about 25 villages within a radius of about six miles.

The village and country lines in use represent a load of about 150 kW and 100,000 kWh sold per annum, but within a few months this will increase. The charges in the country areas are the same as in Northwich and the other towns.

For distribution to the small towns and larger villages adjacent to the transmission line the pressure is stepped down from 33,000 volts to 400/230 volts, 3-phase, by outdoor transforming units of the simplest possible composition, comprising oil-immersed self-cooled transformer, horn-type air-break switches, and horn-type h.p. fuses. The smaller villages are dealt with in connection with country lines, which are supplied at 3,300 volts single-phase from outdoor sub-stations on the 33,000-volt routes.

The country lines feed villages, mansions and farms, through pole-mounted single-phase transformers at 3,300/220 volts. The cost of running these country lines for 3-phase distribution would be prohibitive; and no difficulty has been experienced in the use of single-phase motors, as they rarely are required to start under load.

Even with single-phase two-wire lines the cost of extending to small consumers some distance from the main h.p. line is too high and only the larger consumers, or small ones *en route* between large ones, can profitably be taken in. To reach outlying consumers Mr. Fennell proposes, as soon as the necessary authority can be obtained, to run an experimental single-phase, 3,300-volt single line, with earth return. This system, if authorised, will go a long way towards transmitting cheap power to small consumers over widely distributed areas.

Apart from the capital cost of the transmission line the cost of tapping it for a small amount of power is an important factor, which will have a decided influence on the transmission voltage chosen. It is not economical to build a 33,000-volt transformer for a smaller rating than about 20 kVA, single-phase, or 30 kVA 3-phase; but at 3,300 volts the limits are about 2 and 3 kVA respectively.

For these smallest economic ratings the equipment (including transformer) for tapping a 33,000-volt line need not cost more than £150 for single-phase and £200 for 3-phase, or for a 3,300-volt line £35 for single-phase and £60 for 3-phase.

The small outdoor sub-station can be mounted on a single pole for sizes up to 30 kVA, at 3,300 volts; 33,000-volt gear is naturally much heavier and requires an auxiliary pole with a wooden platform, or, alternatively, a concrete raft, with switches and fuses mounted on a pole. This equipment is neither unsafe nor unsightly: as an example of safety, I recently saw near Northwich a flock of sheep warming their noses on a 33,000-volt transformer by the wayside. As to sightliness, the populace have long been used to overhead telegraph and telephone lines, and high-pressure overhead lines are at least no more detrimental to the appearance of the country; in fact, the lines appearing on the face of Cheshire are gradually giving it the beauty of Switzerland.

(2) *Standardisation.*—The second factor in the obtaining of cheap production, on which we need to concentrate, is standardisation; and to effect any influence on national economy the question must be viewed in the broadest sense.

The common materials essential to the construction of electrical machinery have to-day reached a uniform standard necessary to the production of competitive products.

Standard specifications governing the performance of electrical machinery are in a much more advanced state than those for materials.

We are in sight of the day when long and tedious individual specifications will disappear and machinery will simply be purchased on the basis of the British Standard Specification. The effect of this on the possibilities of highly standardising the product and its natural effect in reducing the cost of production cannot be too strongly insisted upon. The V.D.E. Rules in Germany have long been established in this position, and this has been one of the most important causes of the position of Germany in the world's electrical markets.

Of equal importance with the consideration of these matters nationally is their consideration internationally. Standard international specifications will do much to lighten the burden of the British manufacturer in the export market. Often he is not in as good a position as his foreign competitor, who is a nearer neighbour, to get to know intimately the mind and ideas of a prospective customer; and the British maker is often placed at a disadvantage by tendering to the accepted British Standards, which are often more liberal than the foreign standards which might be acceptable to the purchaser.

International standards would put world competition on an equitable basis and effect economy of effort and expense which could be directed into more profitable channels.

The International Electrotechnical Commission is now sitting again regularly and the post-war equilibrium has been re-established to such an extent as to permit again of the inclusion on the Commission of representatives of former enemy countries (which, I understand, will be done at the next Conference in 1926).

This is surely the right spirit in which to approach such questions, since science and engineering, in common with art and sport, should be beyond nationality; and, in addition to this, it is sound commercial common-sense.

The terrible jumble of voltages and frequencies in this country has been one of the most serious impediments to effective standardisation of electrical machinery. Although the efforts of the B.E.S.A. and the authority of the Electricity Commissioners have at last enabled us to see daylight, we are still confronted with 45 different system voltages (excluding l.p. distribution voltages below 600 volts) and 16 different frequencies. It is noteworthy that rather more than one quarter of the total alternating-current plant installed in this country is for frequencies other than 50 cycles.

These conditions, and the relatively small demand at any one time for quantity orders for any particular system, make it impossible for the manufacturer to stock wound and finished motors, transformers, &c. The advantages of mass production as regards cost, stocking and speedy delivery are out of reach.

By way of illustration of what we have to contend with, I recently analysed orders for transformers over a period covering 1,705 transformers manufactured and aggregating 750,000 kVA. For the home market the number of different h.p. voltages was 36, and of l.p. distribution voltages 44. For the export market (covering all parts of the world, except America) the numbers were:—h.p. voltages 46, and l.p. distribution voltages 38. These figures covered a range of voltages as follows:

	H.p. volts.	L.p. volts.
Home	2,000 to 66,000	100 to 670
Export	2,000 to 132,000	100 to 600

For the same batch of orders the total number of different kVA ratings was 88 for 1-phase transformers and 97 for 3-phase transformers, the range of ratings covered being:—

1-phase, 2 to 7,833 kVA.
3-phase, 1.8 to 12,000 kVA.

Had these orders been all for standard voltages, such as those recommended in B.E.S.A. Specification No. 117, and for standard ratings in reasonable well defined steps, I estimate that the total saving in cost would have amounted to approximately 15 per cent.; and this in spite of the fact that the total kVA supplied would have been appreciably higher, by reason of selecting the nearest standard rating to the one actually specified.

Standardisation of designs of the numerous manufacturers is a field which has, as yet, been little explored. Such a proposition is likely to be regarded with suspicion or outside the range of practical policy. It is, however, quite conceivable that it may become, in the not distant future, a national necessity, to enable this country to hold its place against world competition. I have already referred to the advantageous competitive position of America and Germany in certain lines of electrical machinery and apparatus. The benefits of quantity production and resulting lower material and labour costs and the large home demand enable these countries to undersell Britain.

Particular examples to which this applies are industrial motors and small and medium sizes of distribution transformers. The total annual output of the United States in industrial motors and transformers is of the order of 10 times that of Britain: and in face of this we have in this country no fewer than 80 firms manufacturing industrial motors and 15 firms manufacturing distribution transformers (both these numbers including the large firms who make all sizes).

The position we are faced with is that all these firms carry equipment and staff for handling a great variety of sizes and types, *and none of them is manufacturing in really large quantities.*

If designs could be standardised all round and the industry so organised that work was distributed to the individual firms with reference to their equipment for the most efficient handling of each particular range of sizes and types, great benefits would accrue in cheaper cost, more efficient production, shorter deliveries, reduction of spare parts, and the prolongation of life of the harassed designer.

Such a step would not be as revolutionary as might be supposed at first sight. The design and the general construction of the standard types of electrical machinery is nowadays based on certain well-defined and similar lines for all manufacturers.

he dissemination of information through the medium of this stitution has contributed largely to this). The materials ed are practically identical, being often bought from a com- on source.

The designer's art in standard electrical machinery has ached nearly the top of its saturation curve, as is shown by e fact that weights and efficiencies of machines of different akes are very near to one another. The only differences are details of construction and dimensions bound up with the ndard sizes of cores and tools which the individual manu- turer has adopted.

Unification of designs would not involve the revelation of y jealously guarded secrets. The designer's art to-day does t involve such issues, but is mainly a matter of designing fit his particular shop conditions and limitations.

By way of illustration of the gain that could be effected der such a scheme, I estimate that, given a sufficient total mand in standard sizes and voltages, distribution trans- mers up to 1,000 kVA could be produced at from 15 to 20 r cent. lower cost.

As regards industrial motors, a writer in a recent issue of e Electrical Review (who conceals his convictions on this tter under the cloak of the *nom de plume* "M.I.E.E.") imates that a particular size of motor could be turned out from 20 to 30 per cent. cheaper.

The gist of the matter is that co-operation is more conducive progress than competition. Rank heresy as this may ap- ar to some, the national aspect must be put before the rochial one. What is needed is to cut out internal national mpetition and combine the engineering brains and resources the nation to meet foreign competition. Higher efficiency production and cheaper costs are, at the moment, vital to e prosperity of the industry and of the community.

Registration of Engineers.

By the obtaining of a Royal Charter this Institution has ade a great step towards the realisation of the time when all no profess and call themselves engineers must comply with definite and high standard of qualification. One step fur- er is, however, essential, namely, the registration of engi- ers by Act of Parliament. The result of registration would that only registered persons would be permitted the use of e title "Engineer" (or "chartered electrical, civil, or me- anical engineer"), and only registered engineers would be cognised by law. The standard of entry and qualification uld be made quite definite, to the benefit of the whole ofession as regards the quality and efficiency of engineering rk, and the status of the technical engineer. It would also aid in dispelling the appalling ignorance of the public regard- ing a profession on whose efforts it is dependent in one way or another for practically all its conveniences and comforts.

This country lags behind Continental countries in this matter and in Italy the registration of engineers has been carried into effect since the end of the great war. It is also of interest to note that the Royal Institute of British Architects is sub- mitting to Parliament a Registration Bill for Architects; con- current action by the engineering profession would appear very desirable. What is required is the setting up of a Statu- tory General Engineering Council (analogous to the General Medical Council) which would determine the standard of train- ing and qualification required and would keep the register for the profession.

Technical Training.

Closely allied with this subject is that of technical training. The educational training of the technical engineer has now practically become standardised to a technical university course of three or four years, with two years of workshop training either before, after, or sandwiched.

The industry is absorbing all the students turned out, so that there is very little competition or room for selection. The in- dustry needs more than ever the best men in order to compete with foreign competitors, whose activities are gaining in strength every year. To maintain and elevate the standard in all grades of technical occupation it is necessary to attract the best type of men and in greater numbers. Registration of engineers would ultimately conduce to this end, but meanwhile we might, with advantage, concentrate more on the means of selecting and training the best brains from all sources.

Institution Activities.

It is gratifying to note an increase in the number and variety of the papers offered to the Institution, but the number ac- cepted as suitable for reading and discussion is still low. There is, I think, some degree of reticence in offering short and pithy papers on practical subjects, engendered by the feeling that the voluminous and classical type of paper has become the accepted standard. I think much would be gained by the reading and discussion of groups of short papers on specific subjects, presented simultaneously by a number of experts in the particular subject.

The time is over-ripe for an organised system of joint meet- ings between the leading engineering institutions and scien- tific societies, whereby the efficiency of the whole business may be improved. Many useful joint meetings have been held, but these efforts need to be systematic instead of spasmodic.

An All-Electric House.

Detailed Particulars of a 10-Room Glasgow Dwelling.

By Prof. S. PARKER SMITH, D.Sc., M.I.E.E.

(*Abstract of Paper read before the* Institution of Electrical Engineers.)

1923, the author, being in need of a house in Glasgow, a ting opportunity offered itself to build an all-electric house. e most noteworthy feature connected with this proposal was e adverse criticism which it elicited from the majority of ctrical engineers with whom the scheme was discussed; so ich so, that the carrying out of such an unpopular idea must largely attributed to the obstinacy of one who thought that e time had arrived when a professor of electrical engineering ght to have enough faith in his convictions and calculations put them to the test. The calculations are all based on e tariffs of the Glasgow Corporation, which also arranges the hire of electric cookers and fires. The domestic con- mer is offered the choice of two alternatives:—

(1) Energy at 4½d. per kWh for M units, and ¾d. per kWh hereafter; M is based on the annual consumption for light- ng and includes the consumer's share of capital and fixed charges.

(2) A two-part tariff consisting of a fixed charge to cover he consumer's share of capital and fixed charges, and ½d. per kWh for all energy taken; the fixed charge appears to be about one-eighth of the rent, and in the author's case works out at £12 10s. per annum. For the author's house M = 582, and the two-part tariff led to a saving of £7 6s. 5d. in the first year's working.

The house, in which no coal or gas is used, was built to be a me and not a showroom, an important point in determining e capital cost of an all-electric house, for in addition to the reased convenience of life obtainable with essential appara- s, there are many appliances which cannot be legitimately cluded under capital cost. Taking into account the fact that ny appliances can be hired, the cost of the house was 3 to 4 r cent. higher than it would have been with ordinary coal and s appliances and electric lighting. It must, however, be nembered that the architect can effect many small savings. An idea of the layout can be obtained from figs. 1, 2 and 3. . J. Austen Laird, of Glasgow, designed the house, whilst e author was responsible for the electrical layout. There are 10 rooms—three reception-rooms and kitchen on the ground floor, five bedrooms on the first floor, and a large attic nursery. Below the ground floor there is a sloping space like a shallow cellar, 3 to 4 ft. high, which is used for much of the ground- floor wiring. There is no scullery or wash-house, the only outhouse being a garage. There are three external chim- ney breasts, used for ventilation. By fitting grates and re- placing the ventilators by chimney-pots, coal fires could be used—a feature which calls forth the approval of many critics of the all-electric idea. There are no mantelpieces or over- mantels, but fireplace recesses have been retained owing to the common practice of sitting round a fire.

Distribution Board.—Separate meters were installed for heat- ing, hot water, cooking, and lighting; they are experimental and would not be needed for the ordinary consumer. The main meter is of the two-rate type and is actuated by a 40-day clock, so that the day and the night consumptions can be recorded separately. There are 31 heating circuits, and 5 cir- cuits for cooking and hot water; each has its own fuses and goes to one point only, as indicated in figs. 1, 2 and 3, by H_1 to H_{17}, H_{19} to H_{29}, C_1, C_2, W_1, W_2 and W_3 (H_{18} is in the garage; H_{30} and H_{31} are in the attic nursery). These points are 15-ampere wall sockets, with the exception of the cooker and the hot-water tank which are wired for 30 amperes. The light- ing distribution board is in the housemaid's closet on the first floor (fig. 2) and feeds four circuits. The main distribution board is between the hall and cloak-room.

Wiring.—In general, the regulations of the Institution were adhered to and rubber sheathed cable (c.t.s.) was used; nothing has yet occurred to make the author believe that it was not the cheapest and the best solution. The supply is direct current at 250 volts, the positive and neutral being brought to the house.

Switch-sockets are used throughout, of the 15-ampere, 3-pin, flush pattern with a mechanical interlock to prevent the plug being removed with the switch on, or switching on before in- serting the plug. With few exceptions, switch-sockets are in-

serted in the skirting board and the switches are arranged to be put on or off by the foot. The object in employing sockets all of the same size is to enable all fires and other appliances to be used wherever desired. The author's experience has shown that in the living rooms 4 to 5 points per room are desirable. In certain places it has been found convenient to duplicate some of the points by using a 15-ampere plug with a 5-ampere adapter.

Bells.—In order to have the bell circuits as sound as the lighting and heating circuits, c.t.s. wire was also used.

Lighting.—The charge for lighting comes to about nine shillings per quarter, consequently abundant lighting everywhere is permissible. Relatively, therefore, the cost of lamps is an important factor; indeed, this may be a case where underrunning lamps (*i.e.*, running lamps at less than the rated voltage)

Ground Floor. First Floor. Kitchen.

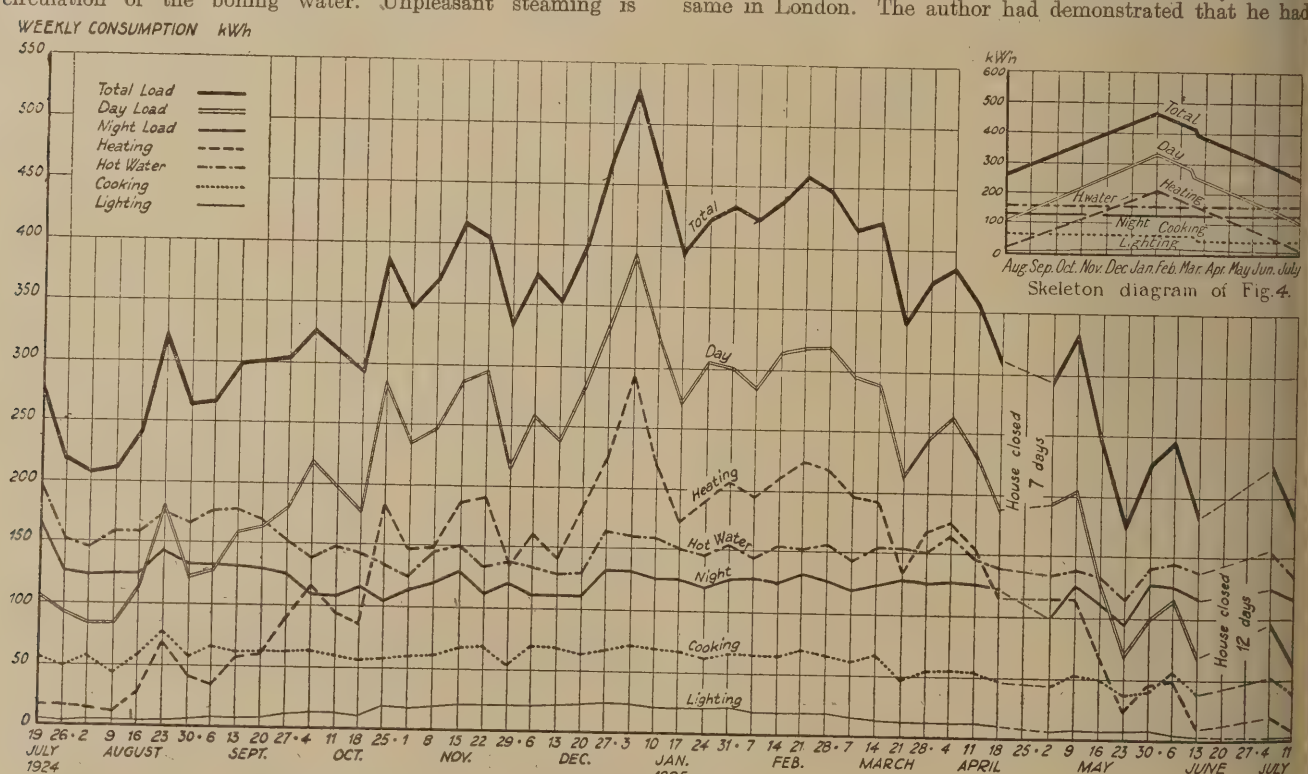
Figs. 1, 2 & 3.—Plans of 10-roomed All-electric House in Glasgow.

may be sound policy for the user. Wherever it is desirable to operate a light from more than one point, suitable switching is provided and the convenience of being able to control the stair lights from 7 points can scarcely be exaggerated. In the kitchen an additional strong light is placed over the cooker and all the switches are of the flush pattern; exposed or unshaded filaments are avoided throughout the house.

Clothes Washing and Drying.—In Glasgow a wash-tub is often fitted alongside the sink, and a small wringer with rubber rollers can be readily attached. Alongside the enamelled tub a wash-boiler of the percolator pattern has been placed (see fig. 3); the loadings are 2 kW, 1 kW and ½ kW. Articles, after being soaped, are placed in this boiler, no preliminary scrubbing being necessary, as the washing is done by the continuous circulation of the boiling water. Unpleasant steaming is avoided by controlling the heat, and after bringing the water to the boil the process is usually completed in half an hour with the rotary switch on "low."

Drying facilities become essential in a wet climate. For this purpose, the drying-closet shown in fig. 3 has been provided. The clothes are hung over wooden rods, while an exhaust fan draws air from the space below the floor, which passes over an air warmer of the convector type, rated at 1½ kW. After an hour the dried clothes come out as fresh as if they had been hung out in sunshine.

Cooking.—Electric cooking well merits the success it has gained and it is probable that much less will be heard of the "nasty smell of cooking throughout the house." The thermometer on the oven door and the clock enable results to b obtained which will be particularly appreciated by the growin number of refined women who have to do their own cooking Indeed, the splendid results obtainable may make cookin attractive to many intelligent people.



The cooker is of the table type with the oven alongside th boiling-table. This avoids stooping and the oven and grille can be given unstinted praise. The two boiling-plates are rate at 1½ kW and 2 kW respectively and are of the open type Though satisfactory when properly maintained, manufacturer must try to do better with their boiling-plates; the efficienc of the open-type boiling-plate may be 20 to 25 per cent. whe starting from cold, or little better than that of a coal fir Numerous experiments by the author have shown that sub stantial improvements are possible—see "cooking" load curve fig. 4, showing the fall in consumption—and no one will be better pleased than supply undertakings when makers can improve the efficiency and reduce the upkeep charges of boiling-plates.

Probably in some households it would be better to provide three boiling-plates on the boiling-table, while large and small ovens might be an advantage. It has been found that rustless steel makes excellent baking shelves for ovens.

(To be concluded.)

Discussion in London.

Col. R. E. CROMPTON opened the discussion by pointing out that the author had had an efficient partner in the City of Glasgow Electricity Department; he wished that they had the same in London. The author had demonstrated that he had
